The Phenomenology of Spirit

Translated by J. B. Baillie

First published in 1807, *Phänomenologie des Geistes* was described by its author as an “exposition of the coming to be of knowledge”, explicated through a necessary self-origination and dissolution of “the various shapes of spirit as stations on the way through which spirit becomes pure knowledge”. The book marked a significant development in German idealism, following on from the work of Immanuel Kant. Focusing on topics in metaphysics, epistemology, physics, ethics, history, religion, perception, consciousness and political philosophy, Hegel uses the treatise to develop his concepts of dialectic (including the master–slave dialectic), absolute idealism, ethical life and Aufhebung. *Phänomenologie des Geistes* has had a profound effect on the course of Western philosophy and has been linked with the development of existentialism, communism, fascism, death of God theology and historicist nihilism.

The book consists of a Preface, an Introduction, and six major divisions of varying size: “Consciousness”, “Self-Consciousness”, “Reason”, “Spirit”, “Religion”, and “Absolute Knowledge”. Most of these sections have further hierarchical subdivisions, and some versions of the book’s table of contents also group the last four together as a single section on a level with the first two. Due to its obscure nature and the many works by Hegel that followed its publication, even the structure or core theme of the book itself remains contested — Hegel wrote the book under close time constraints, with little chance for revision (individual chapters were sent to the publisher before others were written). Also, the text abounds with both highly technical argument in philosophical language, and concrete

examples, either imaginary or historical, of developments by people through different states of consciousness. The relationship between these is disputed: whether Hegel meant to prove claims about the development of world history or simply used it for illustration; whether or not the more conventionally philosophical passages are meant to address specific historical and philosophical positions; and so forth.

Jean Hyppolite famously interpreted the work as a *Bildungsroman*, following the progression of its protagonist, Spirit, through the history of consciousness, is depicted as a characterisation that remains prevalent among literary theorists. However, others contest this literary interpretation and instead read the work as a "self-conscious reflective account" that a society must give of itself in order to understand itself and therefore become reflective. Martin Heidegger saw it as the foundation of a larger "System of Science" that Hegel sought to develop, while Alexandre Kojève regarded it as akin to a "Platonic Dialogue ... between the great Systems of history."

The Hegelian method consists of actually examining consciousness' experience of both itself and of its objects and eliciting the contradictions and dynamic movement that come to light in looking at this experience. Hegel employs the concept "pure looking at" to describe this method. If consciousness only pays attention to what is actually present in itself and its relation to its objects, it will see that what looks like stable and fixed forms dissolve into a dialectical movement. Thus, philosophy, according to Hegel, cannot only set out arguments based on a flow of deductive reasoning. Instead, it must look at actual consciousness, as it really exists. Hegel argues stalwartly against the epistemological emphasis of modern philosophy from Descartes through to Kant, which he describes as having to first establish the nature and criteria of knowledge, prior to actually knowing anything, since this would imply an infinite regress, a *foundationalism* that Hegel maintains is self-contradictory and impossible.

Therefore, he maintains, we must examine actual knowing as it occurs in real knowledge processes. This explains why Hegel employs the term “phenomenology”, which comes from the Greek for “to appear”, and the phenomenology of mind is thus the study of how consciousness or mind appears to itself. In Hegel’s dynamic system, it concerns the study of the successive appearances of the mind to itself, as on examination each one dissolves into a later, more comprehensive and integrated form or structure of mind.

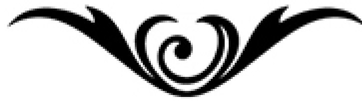
CONTENTS



Hegel as a young man

Immanuel Kant by Johann Gottlieb Becker, 1768 — Immanuel Kant (1724-1804) was an influential German philosopher, whose doctrine of transcendental idealism argued that space, time and causation are mere sensibilities. Kant's pioneering work would have a lasting impact on Hegel's thinking.

Preface: On Scientific Knowledge

IN THE CASE of a philosophical work it seems not only superfluous, but, in view of the nature of philosophy, even inappropriate and misleading to begin, as writers usually do in a preface, by explaining the end the author had in mind, the circumstances which gave rise to the work, and the relation in which the writer takes it to stand to other treatises on the same subject, written by his predecessors or his contemporaries. For whatever it might be suitable to state about philosophy in a preface — say, an historical sketch of the main drift and point of view, the general content and results, a string of desultory assertions and assurances about the truth — this cannot be accepted as the form and manner in which to expound philosophical truth.

Moreover, because philosophy has its being essentially in the element of that universality which encloses the particular within it, the end or final result seems, in the case of philosophy more than in that of other sciences, to have absolutely expressed the complete fact itself in its very nature; contrasted with that the mere process of bringing it to light would seem, properly speaking, to have no essential significance. On the other hand, in the general idea of e.g. anatomy — the knowledge of the parts of the body regarded as lifeless — we are quite sure we do not possess the objective concrete fact, the actual content of the science, but must, over and above, be concerned with particulars. Further, in the case of such a collection of items of knowledge, which has no real right to the name of science, any talk about purpose and suchlike generalities is not commonly very different from the descriptive and superficial way in which the contents of the science these nerves and muscles, etc.-are themselves spoken of. In philosophy, on the other hand, it would at once be felt incongruous were such a method made

use of and yet shown by philosophy itself to be incapable of grasping the truth.

In the same way too, by determining the relation which a philosophical work professes to have to other treatises on the same subject, an extraneous interest is introduced, and obscurity is thrown over the point at issue in the knowledge of the truth. The more the ordinary mind takes the opposition between true and false to be fixed, the more is it accustomed to expect either agreement or contradiction with a given philosophical system, and only to see reason for the one or the other in any explanatory statement concerning such a system. It does not conceive the diversity of philosophical systems as the progressive evolution of truth; rather, it sees only contradiction in that variety. The bud disappears when the blossom breaks through, and we might say that the former is refuted by the latter; in the same way when the fruit comes, the blossom may be explained to be a false form of the plant's existence, for the fruit appears as its true nature in place of the blossom. These stages are not merely differentiated; they supplant one another as being incompatible with one another. But the ceaseless activity of their own inherent nature makes them at the same time moments of an organic unity, where they not merely do not contradict one another, but where one is as necessary as the other; and this equal necessity of all moments constitutes alone and thereby the life of the whole. But contradiction as between philosophical systems is not wont to be conceived in this way; on the other hand, the mind perceiving the contradiction does not commonly know how to relieve it or keep it free from its onesidedness, and to recognize in what seems conflicting and inherently antagonistic the presence of mutually necessary moments.

The demand for such explanations, as also the attempts to satisfy this demand, very easily, pass for the essential business philosophy has to undertake. Where could the inmost truth of a philosophical work be found

better expressed than in its purposes and results? and in what way could these be more definitely known than through their distinction from what is produced during the same period by others working in the same field? If, however, such procedure is to pass for more than the beginning of knowledge, if it is to pass for actually knowing, then we must, in point of fact, look on it as a device for avoiding the real business at issue, an attempt to combine the appearance of being in earnest and taking trouble about the subject with an actual neglect of the subject altogether. For the real subject-matter is not exhausted in its purpose, but in working the matter out; nor is the mere result attained the concrete whole itself, but the result along with the process of arriving at it. The purpose of itself is a lifeless universal, just as the general drift is a mere activity in a certain direction, which is still without its concrete realization; and the naked result is the corpse of the system which has left its guiding tendency behind it. Similarly, the distinctive difference of anything is rather the boundary, the limit, of the subject; it is found at that point where the subject-matter stops, or it is what this subject-matter is *not*. To trouble oneself in this fashion with the purpose and results, and again with the differences, the positions taken up and judgments passed by one thinker and another, is therefore an easier task than perhaps it seems. For instead of laying hold of the matter in hand, a procedure of that kind is all the while away from the subject altogether. Instead of dwelling within it and becoming absorbed by it, knowledge of that sort is always grasping at something else; such knowledge, instead keeping to the subject-matter and giving itself up to it, never gets away from itself. The easiest thing of all is to pass judgments on what has a solid substantial content; it is more difficult to grasp it, and most of all difficult to do both together and produce the systematic exposition of it.

The beginning of culture and of the struggle to pass out of the unbroken immediacy of naive Psychical life has always to be made by acquiring

knowledge of universal principles and points of view, by striving, in the first instance, to work up simply to the *thought* of the subject-matter in general, not forgetting at the same time to give reasons for supporting it or refuting it, to apprehend the concrete riches and fullness contained in its various determinate qualities, and to know how to furnish a coherent, orderly account of it and a responsible judgment upon it. This beginning of mental cultivation will, however, very soon make way for the earnestness of actual life in all its fullness, which leads to a living experience of the subject-matter itself; and when, in addition, conceptual thought strenuously penetrates to the very depths of its meaning, such knowledge and style of judgment will keep their clue place in everyday thought and conversation.

2. The element of truth is the Concept/Notion (*Begriff*), and its true form the scientific system

The systematic development of truth in scientific form can alone be the true shape in which truth exists. To help to bring philosophy nearer to the form of science-that goal where it can lay aside the name of *love* of knowledge and be actual knowledge-that *is* what I have set before me. The inner necessity that knowledge should be science lies in its very nature; and the adequate and sufficient explanation for this lies simply and solely in the systematic exposition Of philosophy itself. The external necessity, however, so far as this is apprehended in a universal way, and apart from the accident of the personal element and the particular occasioning influences affecting the individual, is the same as the internal: it lies in the form and shape in which the process of time presents the existence of its moments. To show that the time process does raise philosophy to the level of scientific system would, therefore, be the only true justification of the attempts which aim at proving that philosophy must assume this character; because the temporal

process would thus bring out and lay bare the necessity of it, nay, more, would at the same time be carrying out that very aim itself.

When we state the true form of truth to be its scientific character-or, what is the same thing, when it is maintained that truth finds the medium of its existence in notions or conceptions alone-I know that this seems to contradict an idea with all its consequences which makes great pretensions and has gained widespread acceptance and conviction at the present time. A word of explanation concerning this contradiction seems, therefore, not out of place, even though at this stage it can amount to no more than a dogmatic assurance exactly like the view we are opposing. If, that is to say, truth exists merely in what, or rather exists merely *as* what, is called at one time intuition, at another immediate knowledge of the Absolute, Religion, Being-not being in the centre of divine love, but the very Being of this centre, of the Absolute itself-from that point of view it is rather the opposite of the notional or conceptual form which would be required for systematic philosophical exposition. The Absolute on this view is not to be grasped in conceptual form, but felt, intuited; it is not its conception, but the feeling of it and intuition of it that are to have the say and find expression.

3. Present position of the spirit

If we consider the appearance of a claim like this in its more general setting, and look at the level which the self-conscious mind at present occupies, we shall find that self-consciousness has got beyond the substantial fullness of life, which it used to carry on in the element of thought-beyond the state of immediacy of belief, beyond the satisfaction and security arising from the assurance which consciousness possessed of being reconciled with ultimate reality and with its all. pervading presence, within as well as without. Self-conscious mind has not merely passed beyond that to the opposite extreme of insubstantial reflection of self into self, but beyond this too. It has not

merely lost its essential and concrete life, it is also conscious of this loss and of the transitory finitude characteristic of its content. Turning away from the husks it has to feed on, and confessing that it lies in wickedness and sin, it reviles itself for so doing, and now desires from philosophy not so much to bring it to a knowledge of what it is, as to obtain once again through philosophy the restoration of that sense of solidity and substantiality of existence it has lost. Philosophy is thus expected not so much to meet this want by opening up the compact solidity of substantial existence, and bringing this to the light and level of self-consciousness is not so much to bring chaotic conscious life back to the orderly ways of thought, and the simplicity of the notion, as to run together what thought has divided asunder suppress the notion with its distinctions, and restore the feeling of existence. What it wants from philosophy is not so much insight as edification. The beautiful the holy, the eternal, religion, love-these are the bait required to awaken the desire to bite: not the notion, but ecstasy, not the march of cold necessity in the subject-matter, but ferment and enthusiasm-these are to be the ways by which the wealth of the concrete substance is to be stored and increasingly extended.

With this demand there goes the strenuous effort, almost perfervidly zealous in its activity, to rescue mankind from being sunken in what is sensuous, vulgar, and of fleeting importance, and to raise men's eyes to the stars; as if men had quite forgotten the divine, and were on the verge of finding satisfaction, like worms, in mud and water. Time was when man had a heaven, decked and fitted out with endless wealth of thoughts and pictures. The significance of all that is, lay in the thread of light by which it was attached to heaven; instead of dwelling in the present as it is here and now, the eye glanced away over the present to the Divine, away, so to say, to a present that lies beyond. The mind's gaze had to be directed under compulsion to what is earthly, and kept fixed there; and it has needed a long

time to introduce that clearness, which only celestial realities had, into the crassness and confusion shrouding the sense of things,earthly, and to make attention to the immediate present as such, which was called Experience, of interest and of value. Now we have apparently the need for the opposite of all this; man's mind and interest are so deeply rooted in the earthly that we require a like power to have them raised above that level. His spirit shows such poverty of nature that it seems to long for the mere pitiful feeling of the divine in the abstract, and to get refreshment from that, like a wanderer in the desert craving for the merest mouthful of water. By the little which can thus satisfy the needs of the human spirit we can measure the extent of its loss.

This easy contentment in receiving, or stinginess in giving, does not suit the character of science. The man who only seeks edification, who wants to envelop in mist the manifold diversity of his earthly existence and thought, and craves after the vague enjoyment of this vague and indeterminate Divinity-he may look where he likes to find this: he will easily find for himself the means to procure something he can rave over and puff himself up withal. But philosophy must beware of wishing to be edifying.

Still less must this kind of contentment, which holds science in contempt, take upon itself to claim that raving obscurantism of this sort is something higher than science. These apocalyptic utterances pretend to occupy the very centre and the deepest depths; they look askance at all definiteness and preciseness meaning; and they deliberately hold back from conceptual thinking and the constraining necessities of thought, as being the sort of reflection which, they say, can only feel at home in the sphere of finitude. But just as the-re is a breadth which is emptiness, there is a depth which is empty too: as we may have an extension of substance which overflows into finite multiplicity without the power of keeping the manifold together, in the same way we may have an insubstantial intensity which,

keeping itself in as mere force without actual expression, is no better than superficiality. The force of mind is only as great as its expression; its depth only as deep as its power to expand and lose itself when spending and giving out its substance. Moreover, when this unreflective emotional knowledge makes a pretence of having immersed its own very self in the depths of the absolute Being, and of philosophizing in all holiness and truth, it hides from itself the fact that instead of devotion to God, it rather, by this contempt for all measurable precision and definiteness, simply attests in its own case the fortuitous character of its content, and in the other endows God with its own caprice. When such minds commit themselves to the unrestrained ferment of sheer emotion, they think that, by putting a veil over self-consciousness, and surrendering all understanding, they are thus God's beloved ones to whom He gives His wisdom in sleep. This is the reason, too, that in point of fact, what they do conceive and bring forth in sleep is dreams.

For the rest it is not difficult to see that our epoch is a birth-time, and a period of transition. The spirit of man has broken with the old order of things hitherto prevailing, and with the old ways of thinking, and is in the mind to let them all sink into the depths of the past and to set about its own transformation. It is indeed never at rest, but carried along the stream of progress ever onward. But it is here as in the case of the birth of a child; after a long period of nutrition in silence, the continuity of the gradual growth in size, of quantitative change, is suddenly cut short by the first breath drawn-there is a break in the process, a qualitative change and the child is born. In like manner the spirit of the time, growing slowly and quietly ripe for the new form it is to assume, disintegrates one fragment after another of the structure of its previous world. That it is tottering to its fall is indicated only by symptoms here and there. Frivolity and again ennui, which are spreading in the established order of things, the undefined

foreboding of something unknown-all these betoken that there is something else approaching. This gradual crumbling to pieces, which did not alter the general look and aspect of the whole, is interrupted by the sunrise, which, in a flash and at a single stroke, brings to view the form and structure of the new world.

But this new world is perfectly realized just as little as the new-born child; and it is essential to bear this in mind. It comes on the stage to begin with in its immediacy, in its bare generality. A building is not finished when its foundation is laid; and just as little, is the attainment of a general notion of a whole the whole itself. When we want to see an oak with all its vigour of trunk, its spreading branches, and mass of foliage, we are not satisfied to be shown an acorn instead. In the same way science, the crowning glory of a spiritual world, is not found complete in its initial stages. The beginning of the new spirit is the outcome of a widespread revolution in manifold forms of spiritual culture; it is the reward which comes after a chequered and devious course of development, and after much struggle and effort. It is a whole which, after running its course and laying bare all its content, returns again to itself; it is the resultant abstract notion of the whole. But the actual realization of this abstract whole is only found when those previous shapes and forms, which are now reduced to ideal moments of the whole, are developed anew again, but developed and shaped within this new medium, and with the meaning they have thereby acquired.

4. The principle is not the completion; against formalism

While the new world makes its first appearance merely in general outline, merely as a whole lying concealed and hidden within a bare abstraction, the wealth of the bygone life, on the other hand, is still consciously present in recollection. Consciousness misses in the new form the detailed expanse of content; but still more the developed expression of form by which

distinctions are definitely determined and arranged in their precise relations. Without this last feature science has no general intelligibility, and has the appearance of being an esoteric possession of a few individuals — an esoteric possession, because in the first instance it is only the essential principle or notion of science, only its inner nature that is to be found; and a possession of few individuals, because, at its first appearance, its content is not elaborated and expanded in detail, and thus its existence is turned into something particular. Only what is perfectly determinate in form is at the same time exoteric, comprehensible, and capable of being learned and possessed by everybody. Intelligibility is the form in which science is offered to everyone, and is the open road to it made plain for all. To reach rational knowledge by our intelligence is the just demand of the mind which comes to science. For intelligence, understanding (*Verstand*), is thinking, pure activity of the self in general; and what is intelligible (*Verständige*) is something from the first familiar and common to the scientific and unscientific mind alike, enabling the unscientific mind to enter the domain of science.

Science, at its commencement, when as yet it has reached neither detailed completeness nor perfection of form, is exposed to blame on that account. But it would be as unjust to suppose this blame to attach to its essential nature, as it is inadmissible not to be ready to recognize the demand for that further development in fuller detail. In the contrast and opposition between these two aspects (the initial and the developed stages of science) seems to lie the critical knot which scientific culture at present struggles to loosen, and about which so far it is not very clear. One side parades the wealth of its material and the intelligibility of its ideas; the other pours contempt at any rate on the latter, and makes a parade of the immediate intuitive rationality and divine quality of its content. Although the first is reduced to silence, perhaps by the inner force of truth alone,

perhaps, too, by the noisy bluster of the other side, and even though having regard to the reason and nature of the case it did feel overborne, yet it does not therefore feel satisfied as regards those demands for greater development; for those demands are just, but still unfulfilled. Its silence is due only in part to the victory of the other side; it is half due to that weariness and indifference which are usually the consequence when expectations are being constantly awakened by promises which are not followed up by performance.

The other side no doubt at times makes an easy enough matter of having a vast expanse of content. They haul on to their territory a lot of material, that, namely, which is already familiar and arranged ill order; and since they are concerned more especially about what is exceptional, strange, and curious, they seem all the more to be in possession of the rest, which knowledge in its own way was finished and done with, as well as to have control over what was unregulated and disorderly. Hence everything appears brought within the compass of the Absolute Idea, which seems thus to be recognized in everything, and to have succeeded in becoming a system *in extenso* of scientific knowledge. But if we look more closely at this expanded system we find that it has not been reached by one and the same principle taking shape in diverse ways; it is the shapeless repetition of one and the same idea, which is applied in an external fashion to different material, the wearisome reiteration of it keeping up the semblance of diversity. The Idea, which by itself is no doubt the truth, really never gets any farther than just where it began, as long as the development of it consists in nothing else than such a repetition of the same formula. If the knowing subject carries round everywhere the one inert abstract form, taking up in external fashion whatever material comes his way, and dipping it into this element, then this comes about as near to fulfilling what is wanted — viz. a self-origination of the wealth of detail, and a self-

determining distinction of shapes and forms-as any chance fancies about the content in question. It is rather a monochrome formalism, which only arrives at distinction in the matter it has to deal with, because this is already prepared and well known.

This monotonousness and abstract universality are maintained to be the Absolute. This formalism insists that to be dissatisfied therewith argues an incapacity to grasp the standpoint of the Absolute, and keep a firm hold on it. If it was once the case that the bare possibility of thinking of something in some other fashion was sufficient to refute a given idea, and the naked possibility, the bare general thought, possessed and passed for the entire substantive value of actual knowledge; similarly we find here all the value ascribed to the general idea in this bare form without concrete realization; and we see here, too, the style and method of speculative contemplation identified with dissipating and. resolving what is determinate and distinct, or rather with hurling it down, without more ado and without any justification, into the abyss of vacuity. To consider any specific fact as it is in the Absolute, consists here in nothing else than saying about it that, while it is now doubtless spoken of as something specific, yet in the Absolute, in the abstract identity A = A, there is no such thing at all, for everything is there all one. To pit this single assertion, that "in the Absolute all is one", against the organized whole of determinate and complete knowledge, or of knowledge which at least aims at and demands complete development-to give out its Absolute as the night in which, as we say, all cows are black-that is the very *naïveté* of emptiness of knowledge.

The formalism which has been deprecated and despised by recent philosophy, and which has arisen once more in philosophy itself, will not disappear from science, even though its inadequacy is known and felt, till the knowledge of absolute reality has become quite clear as to what its own true nature consists in. Having in mind that the general idea of what is to be

done, if it precedes the attempt to carry it out, facilitates the comprehension of this process, it is worth while to indicate here some rough idea of it, with the hope at the same time that this will give us the opportunity to set aside certain forms whose habitual presence is a hindrance in the way of speculative knowledge.

5. The absolute is subject —

In my view-a view which the developed exposition of the system itself can alone justify-everything depends on grasping and expressing the ultimate truth not as Substance but as Subject as well. At the same time we must note that concrete substantiality implicates and involves the universal or the immediacy of knowledge itself, as well as that immediacy which is being, or immediacy *qua* object *for* knowledge. If the generation which heard God spoken of as the One Substance was shocked and revolted by such a characterization of his nature, the reason lay partly in the instinctive feeling that in such a conception self-consciousness was simply submerged, and not preserved. But partly, again, the opposite position, which maintains thinking to be merely subjective thinking, abstract universality as such, is exactly the same bare uniformity, is undifferentiated, unmoved substantiality. And even if, in the third place, thought combines with itself the being of substance, and conceives immediacy or intuition (*Anschauung*) as thinking, it is still a question whether this intellectual intuition does not fall back into that inert, abstract simplicity, and exhibit and expound reality itself in an unreal manner.

6. — and what this is

The living substance, further, is that being which is truly subject, or, what is the same thing, is truly realized and actual (*wirklich*) solely in the process of positing itself, or in mediating with its own self its transitions from one state

or position to the opposite. As subject it is pure and simple negativity, and just on that account a process of splitting up what is simple and undifferentiated, a process of duplicating and setting factors in opposition, which [process] in turn is the negation of this indifferent diversity and of the opposition of factors it entails. True reality is merely this process of reinstating self-identity, of reflecting into its own self in and from its other, and is not an original and primal unity as such, not an immediate unity as such. It is the process of its own becoming, the circle which presupposes its end as its purpose, and has its end for its beginning; it becomes concrete and actual only by being carried out, and by the end it involves.

The life of God and divine intelligence, then, can, if we like, be spoken of as love disporting with itself; but this idea falls into edification, and even sinks into insipidity, if it lacks the seriousness, the suffering, the patience, and the labour of the negative. *Per se* the divine life is no doubt undisturbed identity and oneness with itself, which finds no serious obstacle in otherness and estrangement, and none in the surmounting of this estrangement. But this "per se" is abstract generality, where we abstract from its real nature, which consists in its being objective. to itself, conscious of itself on its own account (*für sich zu sein*); and where consequently we neglect altogether the self-movement which is the formal character of its activity. If the form is declared to correspond to the essence, it is just for that reason a misunderstanding to suppose that knowledge can be content with the "per se", the essence, but can do without the form, that the absolute principle, or absolute intuition, makes the carrying out of the former, or the development of the latter, needless. Precisely because the form is as necessary to the essence as the essence to itself, absolute reality must not be conceived of and expressed as essence alone, i.e. as immediate substance, or as pure self-intuition of the Divine, but as form also, and with the entire wealth of the developed form. Only then is it grasped and expressed as really actual.

The truth is the whole. The whole, however, is merely the essential nature reaching its completeness through the process of its own development. Of the Absolute it must be said that it is essentially a result, that only at the end is it what it is in very truth; and just in that consists its nature, which is to be actual, subject, or self-becoming, self-development. Should it appear contradictory to say that the Absolute has to be conceived essentially as a result, a little consideration will set this appearance of contradiction in its true light. The beginning, the principle, or the Absolute, as at first or immediately expressed, is merely the universal. If we say "all animals", that does not pass for zoology; for the same reason we see at once that the words absolute, divine, eternal, and so on do not express what is implied in them; and only mere words like these, in point of fact, express intuition as the immediate. Whatever is more than a word like that, even the mere transition to a proposition, is a form of mediation, contains a process towards another state from which we must return once more. It is this process of mediation, however, that is rejected with horror, as if absolute knowledge were being surrendered when more is made of mediation than merely the assertion that it is nothing absolute, and does not exist in the Absolute.

This horrified rejection of mediation, however, arises as a fact from want of acquaintance with its nature, and with the nature of absolute knowledge itself. For mediating is nothing but self-identity working itself out through an active self-directed process; or, in other words, it is reflection into self, the aspect in which the ego is for itself, objective to itself. It is pure negativity, or, reduced to its utmost abstraction, the process of bare and simple becoming. The ego, or becoming in general, this process of mediating, is, because of its being simple, just immediacy coming to be, and is immediacy itself. We misconceive therefore the nature of reason if we exclude reflection or mediation from ultimate truth., and do not take it to be

a positive moment of the Absolute. It is reflection which constitutes truth the final result, and yet at the same time does away with the contrast between result and the process of arriving at it. For this process is likewise simple, and therefore not distinct from the form of truth, which consists in appearing as simple in the result; it is indeed just this restoration and return to simplicity. While the embryo is certainly, in itself, implicitly a human being, it is not so explicitly, it is not by itself a human being (*für sich*); man is explicitly man only in the form of developed and cultivated reason, which has made itself to be what it is implicitly. Its actual reality is first found here. But this result arrived at is itself simple immediacy; for it is self conscious freedom, which is at one with itself, and has not set aside the opposition it involves and left it there, but has made its account with it and become reconciled to it.

What has been said may also be expressed by saying that reason is purposive activity. The exaltation of so-called nature at the expense of thought misconceived, and more especially the rejection of external purposiveness, have brought the idea of purpose in general into disrepute. All the same, in the sense in which Aristotle, too, characterizes nature as purposive activity, purpose is the immediate, the undisturbed, the unmoved which is self-moving; as such it is subject. Its power of moving, taken abstractly, is its existence for itself, or pure negativity. The result is the same as the beginning solely because the beginning is purpose. Stated otherwise, what is actual and concrete is the same as its inner principle or notion simply because the immediate *qua* purpose contains within it the self or pure actuality. The realized purpose, or concrete actuality, is movement and development unfolded. But this very unrest is the self; and it is one and the same with that immediacy and simplicity characteristic of the beginning just for the reason that it is the result, and has returned upon itself-while this

latter again is just the self, and the self is self-referring and self-relating identity and simplicity.

The need to think of the Absolute as subject, has led men to make use of statements like “God is the eternal”, the “moral order of the world”, or “love”, etc. In such propositions the truth is just barely stated to be Subject, but not set forth as the process of reflectively mediating itself with itself. In a proposition of that kind we begin with the word God. By itself this is a meaningless sound, a mere name; the predicate says afterwards *what* it is, gives it content and meaning: the empty beginning becomes real knowledge only when we thus get to the end of the statement. So far as that goes, why not speak alone of the eternal, of the moral order of the world, etc., or, like the ancients, of pure conceptions such as being, the one, etc., i.e. of what gives the meaning without adding the meaningless sound at all? But this word just indicates that it is not a being or essence or universal in general that is put forward, but something reflected into self, a subject. Yet at the same time this acceptance of the Absolute as Subject is merely anticipated, not really affirmed. The subject is taken to be a fixed point, and to it as their support the predicates are attached, by a process falling within the individual knowing about it, but not looked upon as belonging to the point of attachment itself; only by such a process, however, could the content be presented as subject. Constituted as it is, this process cannot belong to the subject; but when that point of support is fixed to start with, this process cannot be otherwise constituted, it can only be external. The anticipation that the Absolute is subject is therefore not merely not the realization of this conception; it even makes realization impossible. For it makes out the notion to be a static point, while its actual reality is self-movement, self-activity.

Among the many consequences that follow from what has been said, it is of importance to emphasize this, that knowledge is only real and can only

be set forth fully in the form of science, in the form of system; and further, that a so-called fundamental proposition or first principle of philosophy, even if it is true, is yet none the less false just because and in so far as it is merely a fundamental proposition, merely a first principle. It is for that reason easily refuted. The refutation consists in bring out its defective character, and it *is* defective because it is merely the universal, merely a principle, the beginning. If the refutation is complete and thorough, it is derived and developed from the nature of the principle itself, and not accomplished by bringing in from elsewhere other counter assurances and chance fancies. It would be strictly the development of the principle. and thus the completion of its deficiency, were it not that it misunderstands its own purport by taking account solely of the negative aspect of what it seeks to do, and is not conscious of the positive character of its process and result. The really positive working out of the beginning is at the same time just as much the very reverse, it is a negative attitude towards the principle we start from, negative, that is to say, of its one-sided form, which consists in being primarily immediate, a mere purpose. It may therefore be regarded as a refutation of what constitutes the basis of the system; but more correctly it should be looked at as a demonstration that the *basis* or principle of the system is in point of fact merely its *beginning*.

That the truth is only realized in the form of system, that substance is essentially subject, is expressed in the idea which represents the Absolute as Spirit (*Geist*) — the grandest conception of all, and one which is due to modern times and its religion. Spirit is alone Reality. It is the inner being of the world, that which essentially is, and is *per se;* it assumes objective, determinate form, and enters into relations with itself-it is externality (otherness), and exists for self; yet, in this determination, and in its otherness, it is still one with itself-it is self-contained and self-complete, in itself and for itself at once. This self-containedness, however, is first

something known by us, it is implicit in its nature (*an sich*); it is Substance spiritual. It has to become self-contained *for itself,* on its own account; it must be knowledge of spirit, and must be consciousness of itself as spirit. This means, it must be presented to itself as an object, but at the same time straightway annul and transcend this objective form; it must be its own object in which it finds itself reflected. So far as its spiritual content is produced by its own activity, it is only we [the thinkers] who know spirit to be for itself, to be objective to itself; but in so far as spirit knows itself to be for itself, then this self-production, the pure notion, is the sphere and element in which its objectification takes effect, and where it gets its existential form. In this way it is in its existence aware of itself as an object in which its own self is reflected. Mind, which, when thus developed, knows itself to be mind, is science. Science is its realization, and the kingdom it sets up for itself in its own native element.

7. The element of knowledge

A self having knowledge purely of itself in the absolute antithesis of itself, this pure ether as such, is the very soil where science flourishes, is knowledge in universal form. The beginning of philosophy presupposes or demands from consciousness that it should feel at home in this element. But this element only attains its perfect meaning and acquires transparency through the process of gradually developing it. It is pure spirituality as the universal which assumes the shape of simple immediacy; and this simple element, existing as such, is the field of science, is thinking, which can be only in mind. Because this medium, this immediacy of mind, is the mind's substantial nature in general, it is the transfigured essence, reflection which itself is simple, which is aware of itself as immediacy; it is being, which is reflection into itself. Science on its side requires the individual self-consciousness to have risen into this high ether, in order to be able to live

with science, and in science, and really to feel alive there. Conversely the individual has the right to demand that science shall hold the ladder to help him to get at least as far as this position, shall show him that he has in himself this ground to stand on. His right rests on his absolute independence, which he knows he possesses in every type and phase of knowledge; for in every phase, whether recognized by science or not, and whatever be the content, his right as an individual is the absolute and final form, i.e. he is the immediate certainty of self, and thereby is unconditioned being, were this expression preferred. If the position taken up by consciousness, that of knowing about objective things as opposed to itself, and about itself as opposed to them, is held by science to be the very opposite of what science is: if, when in knowing it keeps within itself and never goes beyond itself, science holds this state to be rather the loss of mind altogether-on the other hand the element in which science consists is looked at by consciousness as a remote and distant region, in which consciousness is no longer in possession of itself. Each of these two sides takes the other to be the perversion of the truth. For the naïve consciousness, to give itself up completely and straight away to science is to make an attempt, induced by some unknown influence, all at once to walk on its head. The compulsion to take up this attitude and move about in this position, is a constraining force it is urged to fall in with, without ever being prepared for it and with no apparent necessity for doing so. Let science be *per se* what it likes, in its relation to naïve immediate self-conscious life it presents the appearance of being a reversal of the latter; or, again, because naïve self-consciousness finds the principle of its reality in the certainty of itself, science bears the character of unreality, since consciousness “for itself” is a state quite outside of science. Science has for that reason to combine that other element of self-certainty with its own, or rather to show that the other element belongs to itself, and how it does so.

When devoid of that sort of reality, science is merely the content of mind *qua* something implicit or potential (*an sich*); purpose, which at the start is no more than something internal; not spirit, but at first merely spiritual substance. This implicit moment (*Ansich*) has to find external expression, and become objective on its own account. This means nothing else than that this moment has to establish self-consciousness as one with itself.

8. The ascent into this is the Phenomenology of Spirit

It is this process by which science in general comes about, this gradual development of knowing, that is set forth here in the *Phenomenology of Mind*. Knowing, as it is found at the start, mind in its immediate and primitive stage, is without the essential nature of mind, is sense-consciousness. To reach the stage of genuine knowledge, or produce the element where science is found-the pure conception of science itself-a long and laborious journey must be undertaken. This process towards science, as regards the content it will bring to light and the forms it will assume in the course of its progress, will not be what is primarily imagined by leading the unscientific consciousness up to the level of science: it will be something different, too, from establishing and laying the foundations of science; and anyway something else than the sort of ecstatic enthusiasm which starts straight off with absolute knowledge, as if shot out of a pistol, and makes short work of other points of view simply by explaining that it is to take no notice of them.

The task of conducting the individual mind from its unscientific standpoint to that of science had to be taken in its general sense; we had to contemplate the formative development (*Bildung*) of the universal [or general] individual, of self-conscious spirit. As to the relation between these two [the particular and general individual], every moment, as it gains concrete form and its own proper shape and appearance, finds a place in the

life of the universal individual. The particular individual is incomplete mind, a concrete shape in whose existence, taken as a whole, one determinate characteristic predominates, while the others are found only in blurred outline. In that mind which stands higher than another the lower concrete form of existence has sunk into an obscure moment; what was formerly an objective fact (*die Sache selbst*) is now only a single trace: its definite shape has been veiled, and become simply a piece of shading. The individual, whose substance is mind at the higher level, passes through these past forms, much in the way that one who takes up a higher science goes through those preparatory forms of knowledge, which he has long made his own, in order to call up their content before him; he brings back the recollection of them without stopping to fix his interest upon them. The particular individual, so far as content is concerned, has also to go through the stages through which the general mind has passed, but as shapes once assumed by mind and now laid aside, as stages of a road which has been worked over and levelled out. Hence it is that, in the case of various kinds of knowledge, we find that what in former days occupied the energies of men of mature mental ability sinks to the level of information, exercises, and even pastimes, for children; and in this educational progress we can see the history of the world's culture delineated in faint outline. This bygone mode of existence has already become an acquired possession of the general mind, which constitutes the substance of the individual, and, by thus appearing externally to him, furnishes his inorganic nature. In this respect culture or development of mind (*Bildung*), regarded from the side of the individual, consists in his acquiring what lies at his hand ready for him, in making its inorganic nature organic to himself, and taking possession of it for himself. Looked at, however, from the side of universal mind *qua* general spiritual substance, culture means nothing else than that this

substance gives itself its own self-consciousness, brings about its own inherent process and its own reflection into self.

Science lays before us the morphogenetic process of this cultural development in all its detailed fullness and necessity, and at the same time shows it to be something that has already sunk into the mind as a moment of its being and become a possession of mind. The goal to be reached is the mind's insight into what knowing is. Impatience asks for the impossible, wants to reach the goal without the means of getting there. The length of the journey has to be borne with, for every moment is necessary; and again we must halt at every stage, for each is itself a complete individual form, and is fully and finally considered only so far as its determinate character is taken and dealt with as a rounded and concrete whole, or only so far as the whole is looked at in the light of the special and peculiar character which this determination gives it. Because the substance of individual mind, nay, more, because the universal mind at work in the world (*Weltgeist*),has had the patience to go through these forms in the long stretch of time's extent, and to take upon itself the prodigious labour of the world's history, where it bodied forth in each form the entire content of itself, as each is capable of presenting it; and because by nothing less could that all-pervading mind ever manage to become conscious of what itself is-for that reason, the individual mind, in the nature of the case, cannot expect by less toil to grasp what its own substance contains. All the same, its task has meanwhile been made much lighter, because this has historically been implicitly (*an sich*) accomplished, the content is one where reality is already cancelled for spiritual possibilities, where immediacy has been overcome and brought under the control of reflection, the various forms and shapes have been already reduced to their intellectual abbreviations, to determinations of thought (*Gedankenbestimmung*) pure and simple. Being now a thought, the content is the property of the substance of mind; existence has no more to

be changed into the form of what is inherent and implicit (*Ansichseins*), but only the implicit-no longer merely something primitive, nor lying hidden within existence, but already present as a recollection-into the form of what is explicit, of what is objective to self (*Fürsichseins*).

9. The transformation of the notion and the familiar into thought —

We have to state more exactly the way this is done. At the point at which we here take up this movement, we are spared, in connexion with the whole, the process of cancelling and transcending the stage of mere existence. This process has already taken place. What is still to be done and needs a higher kind of transformation, is to transcend the forms as ideally presented and made familiar to our minds. By that previous negative process, existence, having been withdrawn into the mind's substance, is, in the first instance, transferred to the life of self only in an immediate way. The property the self has thereby acquired, has still the same character of uncomprehended immediacy, of passive indifference, which existence itself had; existence has in this way merely passed into the form of an ideal presentation. At the same time, by so doing, it is something familiar to us, something "well-known", something which the existent mind has finished and done with, and hence takes no more to do with and no further interest in. While the activity that is done with the existent is itself merely the process of the particular mind, of mind which is not comprehending itself, on the other hand, *knowledge* is directed against this ideal presentation which has hereby arisen, against this "being-familiar" and "well-known"; it is an action of *universal* mind, the concern of *thought.*

What is "familiarly known" is not properly known, just for the reason that it is "familiar". When engaged in the process of knowing, it is the commonest form of self-deception, and a deception of other people as well, to assume something to be familiar, and give assent to it on that very

account. Knowledge of that sort, with all its talk, never gets from the spot, but has no idea that this is the case. Subject and object, and so on, God, nature, understanding, sensibility, etc., are uncritically presupposed as familiar and something valid, and become fixed points from which to start and to which to return. The process of knowing flits between these secure points, and in consequence goes on merely along the surface. Apprehending and proving consist similarly in seeing whether every one finds what is said corresponding to his idea too, whether it is familiar and seems to him so and so or not.

Analysis of an idea, as it used to be carried out, did in fact consist in nothing else than doing away with its character of familiarity. To break up an idea into its ultimate elements means returning upon its moments, which at least do not have the form of the given idea when found, but are the immediate property of the self. Doubtless this analysis only arrives at thoughts which are themselves familiar elements, fixed inert determinations. But what is thus separated, and in a sense is unreal, is itself an essential moment; for just because the concrete fact is self-divided, and turns into unreality, it is something self-moving, self-active. The action of separating the elements is the exercise of the force of Understanding, the most astonishing and greatest of all powers, or rather the absolute power. The circle, which is self-enclosed and at rest, and, *qua* substance, holds its own moments, is an immediate relation, the immediate, continuous relation of elements with their unity, and hence arouses no sense of wonderment. But that an accident as such, when out loose from its containing circumference — that what is bound and held by something else and actual only by being connected with it — should obtain an existence all its own, gain freedom and independence on its own account-this is the portentous power of the negative; it is the energy of thought, of pure ego. Death, as we may call that unreality, is the most terrible thing, and to keep and hold fast

what is dead demands the greatest force of all. Beauty, powerless and helpless, hates understanding, because the latter exacts from it what it cannot perform. But the life of mind is not one that shuns death, and keeps clear of destruction; it endures death and in death maintains its being. It only wins to its truth when it finds itself utterly torn asunder. It is this mighty power, not by being a positive which turns away from the negative, as when we say of anything it is nothing or it is false, and, being then done with it, pass off to something else: on the contrary, mind is this power only by looking the negative in the face, and dwelling with it. This dwelling beside it is the magic power that converts the negative into being. That power is just what we spoke of above as subject, which by giving determinateness a place in its substance, cancels abstract immediacy, i.e. immediacy which merely *is*, and, by so doing, becomes the true substance, becomes being or immediacy that does not have mediation outside it, but is this mediation itself.

10. — and this into the Concept/Notion

This process of making what is objectively presented a possession of pure self-consciousness, of raising it to the level of universality in general, is merely one aspect of mental development; spiritual evolution is not yet completed. The manner of study in ancient times is distinct from that of the modem world, in that the former consisted in the cultivation and perfecting of the natural mind. Testing life carefully at all points, philosophizing about everything it came across, the former created an experience permeated through and through by universals. In modem times, however, an individual finds the abstract form ready made. In straining to grasp it and make it his own, he rather strives to bring forward the inner meaning alone, without any process of mediation; the production of the universal is abridged, instead of the universal arising out of the manifold detail of concrete existence. Hence

nowadays the task before us consists not so much in getting the individual clear of the stage of sensuous immediacy, and making him a substance that thinks and is grasped in terms of thought, but rather the very opposite: it consists in actualizing the universal, and giving it spiritual vitality, by the process of breaking down and superseding fixed and determinate thoughts. But it is much more difficult to make fixed and definite thoughts fuse with one another and form a continuous whole than to bring sensuous existence into this state. The reason lies in what was said before. Thought determinations get their substance and the element of their existence from the ego, the power of the negative, or pure reality; while determinations of sense find this in impotent abstract immediacy, in mere being as such. Thoughts become fluent and interfuse, when thinking pure and simple, this inner immediacy, knows itself as a moment, when pure certainty of self abstracts from itself. It does not "abstract" in the sense of getting away from itself and setting itself on one side, but of surrendering the fixed quality of its self-affirmation, and giving up both the fixity of the purely concrete-which is the ego as contrasted with the variety of its content-and the fixity of all those distinctions [the various thought-functions, principles, etc.] which are present in the element of pure thought and share that absoluteness of the ego. In virtue of this process pure thoughts become notions, concepts, and are then what they are in truth, self-moving functions, circles, are what their substance consists in, are spiritual entities.

This movement of the spiritual entities constitutes the nature of scientific procedure in general. Looked at as the concatenation of their content, this movement is the necessitated development and expansion of that content into an organic systematic whole. By this movement, too, the road, which leads to the notion of knowledge, becomes itself likewise a necessary and complete evolving process (*Werden*). This preparatory stage thus ceases to consist of casual philosophical reflections, referring to objects here and

there, to processes and thoughts of the undeveloped mind as chance may direct; and it does not try to establish the truth by miscellaneous ratiocinations, inferences, and consequences drawn from circumscribed thoughts. The road to science, by the very movement of the notion itself, will compass the entire objective world of conscious life in its rational necessity.

Further, a systematic exposition like this constitutes the first part of science, because the positive existence of mind, *qua* primary and ultimate, is nothing but the immediate aspect of mind, the beginning; the beginning, but not yet its return to itself. The characteristic feature distinguishing this part of science [Phenomenology] from the others is the element of positive immediate existence. The mention of this distinction leads us to discuss certain established ideas that usually come to notice in this connexion.

The mind's immediate existence, conscious life, has two aspects — cognition and objectivity which is opposed to or negative of the subjective function of knowing. Since it is in the medium of consciousness that mind is developed and brings out its various moments, this opposition between the factors of conscious life is found at each stage in the evolution of mind, and all the various moments appear as modes or forms (*Gestalten*) of consciousness. The scientific statement of the course of this development is a science of the experience through which consciousness passes; the substance and its process are considered as the object of consciousness. Consciousness knows and comprehends nothing but what falls within its experience; for what is found in experience is merely spiritual substance, and, moreover, object of its self. Mind, however, becomes object, for it consists in the process of becoming an other to itself, i.e. an object for its own self, and in transcending this otherness. And experience is called this very process by which the element that is immediate, unexperienced, i.e. abstract-whether it be in the form of sense or of a bare thought —

externalizes itself, and then comes back to itself from this state of estrangement, and by so doing is at length set forth in its concrete nature and real truth, and becomes too a possession of consciousness.

The dissimilarity which obtains in consciousness between the ego and the substance constituting its object, is their inner distinction, the factor of negativity in general. We may regard it as the defect of both opposites, but it is their very soul, their moving spirit. It was on this account that certain thinkers long ago took the void to be the principle of movement, when they conceived the moving principle to be the negative element, though they had not as yet thought of it as self. While this negative factor appears in the first instance as a dissimilarity, as an inequality, between ego and object, it is just as much the inequality of the substance with itself. What seems to take place outside it, to be an activity directed against it, is its own doing, its own activity; and substance shows that it is in reality subject. When it has brought out this completely, mind has made its existence adequate to and one with its essential nature. Mind is object to itself just as it *is*, and the abstract element of immediacy, of the separation between knowing and the truth, is overcome. Being is entirely mediated; it is a substantial content, that is likewise directly in the possession of the ego, has the character of self, is notion. With the attainment of this the Phenomenology of Mind concludes. What mind prepares for itself in the course of its phenomenology is the element of true knowledge. In this element the moments of mind are now set out in the form of thought pure and simple, which knows its object to be itself. They no longer involve the opposition between being and knowing; they remain within the undivided simplicity of the knowing function; they are the truth in the form of truth, and their diversity is merely diversity of the content of truth. The process by which they are developed into an organically connected whole is Logic or Speculative Philosophy.

11. In what way the Phenomenology of the Spirit is negative or contains what is false

Now, because the systematic statement of the mind's experience embraces merely its ways of appearing, it may well seem that the advance from that to the science of ultimate truth in the form of truth is merely negative; and we might readily be content to dispense with the negative process as something altogether false, and might ask to be taken straight to the truth at once: why meddle with what is false at all? The point formerly raised, that we should have begun with science at once, may be answered here by considering the character of negativity in general regarded as something false. The usual ideas on this subject particularly obstruct the approach to the truth. The consideration of this point will give us an opportunity to speak about mathematical knowledge, which non-philosophical knowledge looks upon as the ideal which philosophy ought to try to attain, but has so far striven in vain to reach.

Truth and falsehood as commonly understood belong to those sharply defined ideas which claim a completely fixed nature of their own, one standing in solid isolation on this side, the other on that, without any community between them. Against that view it must be pointed out, that truth is not like stamped coin that is issued ready from the mint and so can be taken up and used. Nor, again, is there something false, any more than there is something evil. Evil and falsehood are indeed not so bad as the devil, for in the form of the devil they get the length of being particular subjects; *qua* false and evil they are merely universals, though they have a nature of their own with reference to one another. Falsity (that is what we are dealing with here) would be *otherness,* the negative aspect of the substance, which [substance], *qua* content of knowledge, is truth. But the substance is itself essentially the negative element, partly as involving distinction and determination of content, partly as being a process of

distinguishing pure and simple, i.e. as being self and knowledge in general. Doubtless we can know in a way that is false. To know something falsely means that knowledge is not adequate to, is not on equal terms with, its substance. Yet this very dissimilarity is the process of distinction in general, the essential moment in knowing. It is, in fact, out of this active distinction that its harmonious unity arises, and this identity, when arrived at, is truth. But it is not truth in a sense which would involve the rejection of the discordance, the diversity, like dross from pure metal; nor, again, does truth remain detached from diversity, like a finished article from the instrument that shapes it. Difference itself continues to be an immediate element within truth as such, in the form of the principle of negation, in the form of the activity of Self. All the same, we cannot for that reason say that falsehood is a moment or forms even a constituent part of truth. That "in every case of falsity there is something true" is an expression in which they are taken to be like oil and water, which do not mix and are merely united externally. Just in the interest of their real meaning, precisely because we want to designate the aspect or moment of complete otherness, the terms true and false must no longer be used where their otherness has been cancelled and superseded. Just as the expressions "unity of subject and object", of "finite and infinite", of "being and thought", etc., are clumsy when subject and object, etc., are taken to mean what they are *outside* their unity, and are thus in that unity not meant to be what its very expression conveys; in the same way falsehood is not, *qua* false, any longer a moment of truth.

Dogmatism as a way of thinking, whether in ordinary knowledge or in the study of philosophy, is nothing else but the view that truth consists in a proposition, which is a fixed and final result, or again which is directly known. To questions like, "When was Caesar born?". "How many feet make a furlongs", etc., a straight answer ought to be given; just as it is absolutely true that the square of the hypotenuse is equal to the sum of the

squares of the other two sides of a right-angled triangle. But the nature of a so-called truth of that sort is different from the nature of philosophical truth.

12. Historical and mathematical truth

As regards truth in matters of historical fact-to deal briefly with this subject — so far as we consider the purely historical element, it will be readily granted that they have to do with the sphere of particular existence, with a content in its contingent and arbitrary aspects, features that have no necessity. But even bare truths of the kind, say, like those mentioned, are impossible without the activity of self-consciousness. In order to know any one of them, there has to be a good deal of comparison, books must be consulted, or in some way or other inquiry has to be made. Even in a case of direct perception, only when we know it along with the reasons behind it, is it held to be something of real value; although it is merely the naked fact itself that we are, properly speaking, supposed to be concerned about.

As to mathematical truths, we should be still less inclined to consider anyone a geometer who had got Euclid's theorems by heart (*auswendig*) without knowing the proofs, without, if we may say so by way of contrast, getting them into his head (*inwendig*). Similarly, if anyone came to know by measuring many right-angled triangles that their sides are related in the way everybody knows, we should regard knowledge so obtained as unsatisfactory. All the same, while proof is essential in the case of mathematical knowledge, it still does not have the significance and nature of being a moment in the result itself; the proof is over when we get the result, and has disappeared. *Qua* result the theorem is, no doubt, one that is seen to be true. But this eventuality has nothing to do with its content, but only with its relation to the knowing subject. The process of mathematical proof does not belong to the object; it is a function that takes place outside the matter in hand. Thus, the nature of a right-angled triangle does not break

itself up into factors in the manner set forth in the mathematical construction which is required to prove the proposition expressing the relation of its parts. The entire process of producing the result is an affair of knowledge which takes its own way of going about it. In philosophical knowledge, too, the way existence, *qua* existence, comes about (*Werden*) is different from that whereby the essence or inner nature of the fact comes into being. But philosophical knowledge, for one thing, contains both, while mathematical knowledge sets forth merely the way an existence comes about, i.e. the way the nature of the fact gets to be in the sphere of knowledge as such. For another thing, too, philosophical knowledge unites both these particular movements. The inward rising into being, the process of substance, is an unbroken transition into outwardness, into existence or being for another; and conversely, the coming of existence into being is withdrawal into the inner essence. The movement is the twofold process in which the whole comes to be, and is such that each at the same time posits the other, and each on that account has in it both as its two aspects. Together they make the whole, through their resolving each other, and making themselves into moments of the whole.

In mathematical knowledge the insight required is an external function so far as the subject-matter dealt with is concerned. It follows that the actual fact is thereby altered. The means taken, construction and proof, contain, no doubt, true propositions; but all the same we are bound to say that the content is false. The triangle in the above example is taken to pieces, and its parts made into other figures to which the construction in the triangle gives rise. It is only at the end that we find again reinstated the triangle we are really concerned with; it was lost sight of in the course of the construction, and was present merely in fragments, that belonged to other wholes. Thus we find negativity of content coming in here too, a negativity which would

have to be called falsity, just as much as in the case of the movement of the notion where thoughts that are taken to be fixed pass away and disappear.

The real defect of this kind of knowledge, however, affects its process of knowing as much as its material. As to that process, in the first place we do not see any necessity in the construction. The necessity does not arise from the nature of the theorem: it is imposed; and the injunction to draw just these lines, an infinite number of others being equally possible, is blindly acquiesced in, without our knowing anything further, except that, as we fondly believe, this will serve our purpose in producing the proof. Later on this design then comes out too, and is therefore merely external in character, just because it is only after the proof is found that it comes to be known. In the same way, again, the proof takes a direction that begins anywhere we like, without our knowing as yet what relation this beginning has to the result to be brought out. In its course, it takes up certain specific elements and relations and lets others alone, without its being directly obvious what necessity there is in the matter. An external purpose controls this process.

The evidence peculiar to this defective way of knowing — an evidence on the strength of which mathematics plumes itself and proudly struts before philosophy — rests solely on the poverty of its purpose and the defectiveness of its material, and is on that account of a kind that philosophy must scorn to have anything to do with. Its purpose or principle is quantity. This is precisely the relationship that is non-essential, alien to the character of the notion. The process of knowledge goes on, therefore, on the surface, does not affect the concrete fact itself, does not touch its inner nature or lotion, and is hence not a conceptual way of comprehending. The material which provides mathematics with these welcome treasures of truth consists of space and numerical units (*das Eins*). Space is that kind of existence wherein the concrete notion inscribes the diversity it contains, as in an empty, lifeless element in which its differences likewise subsist in

passive, lifeless form. What is concretely actual is not something spatial, such as is treated of in mathematics. With unrealities like the things mathematics takes account of, neither concrete sensuous perception nor philosophy has anything to do. In an unreal element of that sort we find, then, only unreal truth, fixed lifeless propositions. We can call a halt at any of them; the next begins of itself *de novo*, without the first having led up to the one that follows, and without any necessary connexion having in this way arisen from the nature of the subject-matter itself. So, too — and herein consists the formal character of mathematical evidence because of that principle and the element where it applies, knowledge advances along the lines of bare equality, of abstract identity. For what is lifeless, not being self-moved, does not bring about distinction within its essential nature; does not attain to essential opposition or unlikeness; and hence involves no transition of one opposite element into its other, no qualitative, immanent movement, no self-movement, It is quantity, a form of difference that does not touch the essential nature, which alone mathematics deals with. It abstracts from the fact that it is the notion which separates space into its dimensions, and determines the connexions between them and in them. It does not consider, for example, the relation of line to surface, and when it compares the diameter of a circle with its circumference, it runs up against their incommensurability, i.e. a relation in terms of the notion, an infinite element, that escapes mathematical determination.

Immanent or so-called pure mathematics, again, does not oppose time *qua* time to space, as a second subject-matter for consideration. Applied mathematics, no doubt, treats of time, as also of motion, and other concrete things as well; but it picks up from experience synthetic propositions — i.e. statements of their relations, which are determined by their conceptual nature — and merely applies its formulae to those propositions assumed to start with. That the so-called proofs of propositions like that concerning the

equilibrium of the lever, the relation of space and time in gravitation, etc., which applied mathematics frequently gives, should be taken and given as proofs, is itself merely a proof of how great the need is for knowledge to have a process of proof, seeing that, even where proof is not to be had, knowledge yet puts a value on the mere semblance of it, and gets thereby a certain sense of satisfaction. A criticism of those proofs would be as instructive as it would be significant, if the criticism could strip mathematics of this artificial finery, and bring out its limitations, and thence show the necessity for another type of knowledge.

As to time, which, it is to be presumed, would, by way of the counterpart to space, constitute the object-matter of the other division of pure mathematics, this is the notion itself in the form of existence. The principle of quantity, of difference which is not determined by the notion, and the principle of equality, of abstract, lifeless unity, are incapable of dealing with that sheer restlessness of life and its absolute and inherent process of differentiation. It is therefore only in an arrested, paralysed form, only in the form of the quantitative unit, that this essentially negative activity becomes the second object-matter of this way of knowing, which, itself an external operation, degrades what is self-moving to the level of mere matter, in order thus to get an indifferent, external, lifeless content.

13. The nature of philosophical truth and its method

Philosophy, on the contrary, does not deal with a determination that is non-essential, but with a determination so far as it is an essential factor. The abstract or unreal is not its element and content, but the real, what is self-establishing, has life within itself, existence in its very notion. It is the process that creates its own moments in its course, and goes through them all; and the whole of this movement constitutes its positive content and its truth. This movement includes, therefore, within it the negative factor as

well, the element which would be named falsity if it could be considered one from which we had to abstract. The element that disappears has rather to be looked at as itself essential, not in the sense of being something fixed, that has to be cut off from truth and allowed to lie outside it, heaven knows where; just as similarly the truth is not to be held to stand on the other side as an immovable lifeless positive element. Appearance is the process of arising into being and passing away again, a process that itself does not arise and does not pass away, but is *per se,* and constitutes reality and the life-movement of truth. The truth is thus the bacchanalian revel, where not a member is sober; and because every member no sooner becomes detached than it *eo ipso* collapses straightway, the revel is just as much a state of transparent unbroken calm. Judged by that movement, the particular shapes which mind assumes do not indeed subsist any more than do determinate thoughts or ideas; but they are, all the same, as much positive and necessary moments, as negative and transitory. In the entirety of the movement, taken as an unbroken quiescent whole, that which obtains distinctness in the course of its process and secures specific existence, is preserved in the form of a self-recollection, in which existence is self-knowledge, and self-knowledge, again, is immediate existence.

It might well seem necessary to state at the outset the chief points in connexion with the method of this process, the way in which science operates. Its nature, however, is to be found in what has already been said, while the proper systematic exposition of it is the special business of Logic, or rather is Logic itself. For the method is nothing else than the structure of the whole in its pure and essential form. In regard, however, to what has been hitherto currently held on this point, we must be sensible that the system of ideas bearing on the question of philosophical method, belongs also to a stage of mental culture that has now passed away. This may perhaps seem somewhat boastful or revolutionary; and I am far from

adopting an attitude of that sort; but it is significant that the scientific régime bequeathed by mathematics — a régime of explanations, divisions, axioms, an array of theorems, with proofs, principles, and the consequences and conclusions drawn from them — all this has already come to be generally considered as at any rate out of date. Even though there is no clear idea why it is unsuitable, yet little or no use is made of it any longer; and even though it is not condemned outright, it is all the same not in favour. And we must be so far prejudiced in favour of what is excellent to believe that it can turn itself to practical account, and make itself acceptable. But it is not difficult to see that the method of propounding a proposition, producing reasons for it and then refuting its opposite by reasons too, is not the form in which truth can appear. Truth moves itself by its very nature; but the method just mentioned is a form of knowledge external to its material. Hence it is peculiar to mathematics and must be left to mathematics, which, as already indicated, takes for its principle the relation of quantity, a relation alien to the notion, and gets its material from lifeless space, and the equally lifeless numerical unit. Or, again, such a method, adopting a freer style, one involving more of arbitrariness and chance, may have a place in ordinary life, in a conversation, or in supplying matter-of-fact instruction for the satisfaction of curiosity rather than knowledge, very much as a preface does. In every-day life the mind finds its content in different kinds of knowledge, experiences of various sorts, concrete facts of sense, thoughts, too, and principles, and, in general, in whatever lies ready to hand, or passes for a solid stable entity, or real being. The mind follows wherever this leads, sometimes interrupting the connexion by an unrestrained caprice in dealing with the content, and takes up the attitude of determining and handling it in quite an external fashion. It runs the content back to some touchstone of certainty or other, even though it be but the

feeling of the moment; and conviction is satisfied if it reaches some familiar resting-place.

But when the necessity of the notion banishes from its realm the loose procedure of the “raisonnements” of conversation, as well as the pedantic style of scientific pomposity, its place, as we have already mentioned, must not be taken by the disconnected utterance of presageful surmise and inspiration, and the arbitrary caprice of prophetic utterance; for this does not merely despise that particular form of scientific procedure, but contemns scientific procedure altogether.

14. Against schematizing formalism

Now that the triplicity, adopted in the system of Kant — a method rediscovered, to begin with, by instinctive insight, but left lifeless and uncomprehended — has been raised to its significance as an absolute method, true form is thereby set up in its true content, and the conception of science has come to light. But the use this form has been put to in certain quarters has no right to the name of science. For we see it there reduced to a lifeless schema, to nothing better than a mere shadow, and scientific organization to a synoptic table. This formalism — about which we spoke before in general terms, and whose procedure we wish here to state more fully — thinks it has comprehended and expressed the nature and life of a given form when it proclaims a determination of the schema to be its predicate. The predicate may be subjectivity or objectivity, or again magnetism, electricity, and so on, contraction or expansion, East or West, and such like — a form of predication that can be multiplied indefinitely, because according to this way of working each determination, each mode, can be applied as a form or schematic element in the case of every other, and each will thankfully perform. the same service for any other. With a circle of reciprocities of this sort it is impossible to make out what the real

fact in question is, or what the one or the other is. We find there sometimes constituents of sense picked up from ordinary intuition, determinate elements which to be sure should mean something else than they say; at other times what is inherently significant, viz. pure determinations of thought-like subject, object, substance, cause, universality, etc.-these are applied just as uncritically and unreflectingly as in every-day life, are used much as people employ the terms strong and weak, expansion and contraction. As a result that type of metaphysics is as unscientific as those ideas of sense.

Instead of the inner activity and self-movement of its own actual life, such a simple determination of direct intuition (*Anschauung*) — which means here sense-knowledge — is predicated in accordance with a superficial analogy, and this external and empty application of the formula is called "construction". The same thing happens here, however, as in the case of every kind of formalism. A man's head must be indeed dull if he could not in a quarter of an hour get up the theory that there are enervating, innervating, and indirectly enervating diseases and as many cures, and who could not — since not so long ago instruction of that sort sufficed for the purpose-in as short a time be turned from being a man who works by rule of thumb into a theoretical physician. Formalism in the case of speculative Philosophy of Nature (*Naturphilosophie*) takes the shape of teaching that understanding is electricity, animals are nitrogen, or equivalent to South or North and so on. When it does this, whether as badly as it is here expressed or even concocted with more terminology, such forceful procedure brings and holds together elements to all appearance far removed from one another; the violence done to stable inert sense-elements by connecting them in this way, confers on them merely the semblance of a conceptual unity, and spares itself the trouble of doing what is after all the important thing — expressing the notion itself, the meaning that underlies sense-ideas.

All this sort of thing may strike anyone who has no experience with admiration and wonder. He may be awed by the profound genius he thinks it displays, and be delighted at the happy ingenuity of such characterizations, since they fill the place of the abstract notion with something tangible and sensuous, and so make it more pleasing; and he may congratulate himself on feeling an instinctive mental affinity for that glorious way of proceeding. The trick of wisdom of that sort is as quickly acquired as it is easy to practise. Its repetition, when once it is familiar, becomes as boring as the repetition of any bit of sleight-of-hand once we see through it. The instrument for producing this monotonous formalism is no more difficult to handle than the palette of a painter, on which lie only two colours, say red and green, the former for colouring the surface when we want a historical piece, the latter when we want a bit of landscape. It would be difficult to settle which is greater in all this, the agreeable ease with which everything in heaven and earth and under the earth is plastered with that botch of colour, or the conceit that prides itself on the excellence of its means for every conceivable purpose; the one lends support to the other. What results from the use of this method of sticking on to everything in heaven and earth, to every kind of shape and form, natural and spiritual, the pair of determinations from the general schema, and filing everything in this manner, is no less than an "account as clear as noonday" of the organized whole of the universe. It is, that is to say, a synoptic index, like a skeleton with tickets stuck all over it, or like the rows of boxes kept shut and labelled in a grocer's stall; and is as intelligible as either the one or the other. It has lost hold of the living nature of concrete fact; just as in the former case we have merely dry bones with flesh and blood all gone, and in the latter, there is shut away in those boxes something equally lifeless too. We have already remarked that the final outcome of this style of thinking is, at the same time, to paint entirely in one kind of colour; for it turns with

contempt from the distinctions in the schematic table, looks on them as belonging to the activity of mere reflection, and lets them drop out of sight in the void of the Absolute, and there reinstates pure identity, pure formless whiteness. Such uniformity of colouring in the schema with its lifeless determinations, this absolute identity, and the transition from one to the other — these are the one as well as the other, the expression of inert lifeless understanding, and equally an external process of knowledge.

Not only can what is excellent not escape the fate of being thus devitalized and despiritualized and excoriated of seeing its skin paraded about by lifeless knowledge and the conceit such knowledge engenders; but rather, such a fate lets us realize the power the "excellent" exercises over the heart (*Gemüth*), if not over the mind (*Geist*). Moreover, we recognize thereby, too, the constructive unfolding into universality and determinateness of form which marks the complete attainment of excellence, and which alone makes it possible that this universality can be turned to superficial uses.

Science can become an organic system only by the inherent life of the notion. In science the determinateness, which was taken from the schema and stuck on to existing facts in external fashion, is the self directing inner soul of the concrete content. The movement of what is partly consists in becoming another to itself, and thus developing explicitly into its own immanent content; partly, again, it takes this evolved content, this existence it assumes, back into itself, i.e. makes itself into a moment, and reduces itself to simple determinateness. In the first stage of the process negativity lies in the function of distinguishing and establishing existence; in this latter return into self, negativity consists in the bringing about of determinate simplicity. It is in this way that the content shows its specific characteristic not to be received from something else, and stuck on externally; the content gives itself this determinate characteristic, appoints itself of its own

initiative to the rank of a moment and to a place in the whole. The pigeon-holing process of understanding retains for itself the necessity and the notion controlling the content, that which constitutes the concrete element, the actuality and living process of the subject-matter which it labels: or rather, understanding does not retain this for itself, on the contrary, understanding fails to know it. For if it had as much insight as that, it would surely show that it had. It is not even aware of the need for such insight; if it were, it would drop its schematizing process, or at least would no longer be satisfied to know by way of a mere table of contents. A table of contents is all that understanding gives, the content itself it does not furnish at all.

If the specific determination (say even one like magnetism) is one that in itself is concrete or actual, it all the same gets degraded into something lifeless and inert, since it is merely predicated of another existing entity, and not known as an immanent living principle of this existence; nor is there any comprehension of how in this entity its intrinsic and peculiar way of expressing and producing itself takes effect. This, the very kernel of the matter, formal understanding leaves to others to add later on. Instead of making its way into the inherent content of the matter in hand, understanding always takes a survey of the whole, assumes a position above the particular existence about which it is speaking, i.e. it does not see it at all. True scientific knowledge, on the contrary, demands abandonment to the very life of the object, or, which means the same thing, claims to have before it the inner necessity controlling the object, and to express this only. Steeping itself in its object, it forgets to take that general survey, which is merely a turning of knowledge away from the content back into itself. But being sunk into the material in hand, and following the course that such material takes, true knowledge returns back into itself, yet not before the content in its fullness is taken into itself, is reduced to the simplicity of being a determinate characteristic, drops to the level of being one aspect of

an existing entity, and passes over into its higher truth. By this process the whole as such, surveying its entire content, itself emerges out of the wealth wherein its process of reflection seemed to be lost.

In general, in virtue of the principle that, as we expressed it before, substance is implicitly and in itself subject, all content makes its reflection into itself in its own special way. The subsistence or substance of anything that exists is its self-identity; for its want of identity, or oneness with itself, would be its dissolution. But self-identity is pure abstraction; and this is just thinking. When I say Quality, I state simple determinateness; by means of its quality one existence is distinguished from another or is an “existence”; it is for itself, something on its own account, or subsists with itself because of this simple characteristic. But by doing so it is essentially Thought.

Here we find contained the principle that Being is Thought: here is exercised that insight which usually tends to deviate from the ordinary non-conceptual way of speaking of the identity of thought and being. In virtue, further, of the fact that subsistence on the part of what exists is self-identity or pure abstraction, it is the abstraction of itself from itself, in other words, is itself its own want of identity with itself and dissolution — its own proper inwardness and retraction into self — its process of becoming.

Owing, to the nature which being thus has, and so far as what is has this nature from the point of view of knowledge, this thinking is not an activity which treats the content as something alien and external; it is not reflection into self away from the content. Science is not that kind of Idealism which stepped into the place of the Dogmatism of mere assertion and took the shape of a Dogmatism of mere assurance, the Dogmatism of mere self-certainty. Rather, since knowledge sees the content go back into its own proper inner nature, the activity of knowledge is absorbed in that content — for it (the activity) is the immanent self of the content — and is also at the same time returned into itself, for this activity is pure self-identity in

otherness. In this way the knowing activity is the artful device which, while seeming to refrain from activity, looks on and watches how specific determinateness with its concrete life, just where it believes it is working out its own self-preservation and its own private interest, is, in point of fact, doing the very opposite, is doing what brings about its own dissolution and makes itself a moment in the whole.

While, in the foregoing, the significance of Understanding was stated from the point of view of the self-consciousness of substance; by what has been here stated we can see clearly its significance from the point of view of substance *qua* being. Existence is Quality, self-identical determinateness, or determinate simplicity, determinate thought: this is existence from the point of view of Understanding. On this account it is as Anaxagoras first thought reality to be. Those who succeeded him grasped the nature of existence in a more determinate way as determinate or specific universality, kind or species. The term species or kind seems indeed too ordinary and inadequate for Ideas, for beauty, holiness, eternal, which are the vogue in these days. As a matter of fact, however, idea means neither more nor less than kind, species. But we often find nowadays that a term which exactly designates a conception is despised and rejected, and another preferred to it which hides and obscures the conception, and thus sounds more edifying, even though this is merely due to its being expressed in a foreign language.

Precisely for the reason that existence is designated a species or kind, it is naked simple thought: simplicity, is substance. It is on account of its simplicity, its self-identity, that it appears steady, fixed, and permanent. But this self-identity is likewise negativity; hence that fixed and stable existence carries the process of its own dissolution within itself. The determinateness appears at first to be so solely through its relation to something else; and its process seems imposed and forced upon it externally. But its having its own otherness within itself, and the fact of its being a self-initiated process —

these are implied in the very simplicity of thought itself. For this is self-moving thought, thought that distinguishes, is inherent inwardness, the pure notion. Thus, then, it is the very nature of understanding to be a process; and being a process it is Rationality.

In the nature of existence as thus described — to be its own notion and being in one — consists logical necessity in general. This alone is what is rational, the rhythm of the organic whole: it is as much knowledge of content as that content is notion and essential nature. In other words, this alone is the sphere and element of speculative thought. The concrete shape of the content is resolved by its' own inherent process into a simple determinate quality. Thereby it is raised to logical form, and its being and essence coincide; its concrete existence is merely this process that takes place, and is *eo ipso* logical existence. It is therefore needless to apply a formal scheme to the concrete content in an external fashion; the content is in its very nature a transition into a formal shape, which, however, ceases to be formalism of an external kind, because the form is the indwelling process of the concrete content itself.

This nature of scientific method, which consists partly in being inseparable from the content, and partly in determining the rhythm of its movement by its own agency, finds, as we mentioned before, its peculiar systematic expression in speculative philosophy. What is here stated describes in effect the essential principle; but cannot stand for more at this stage than an assertion or assurance by way of anticipation. The truth it contains is not to be found in this exposition, which is in part historical in character. And just for that reason, too, it is not in the least refuted if anyone assures us on the contrary that this is not so, that the process instead is here so and so; if ideas we are all used to, being truths accepted or settled and familiar to everyone, are brought to mind and recounted; or, again, if

something new is served up and Guaranteed as coming from the inner sanctuaries of inspired intuition.

Such a view is bound to meet with opposition. The first instinctive reaction on the part of knowing, when offered something that was unfamiliar, is usually to resist it. It seeks by that means to save freedom and native insight, to secure its own inherent authority against alien authority — for that is the way anything apprehended for the first time appears. This attitude is adopted, too, in order to do away with the semblance of a kind of disgrace which would lie in the fact that something has had to be learnt. In like manner, again, when the unfamiliar or unknown is received with applause, the reaction is in the same way an exaltation of freedom and native authority. It consists in something analogous to ultra-revolutionary declamation and action.

15. The demands of the study of philosophy

Hence the important thing for the student of science is to make himself undergo the strenuous toil of conceptual reflection, of thinking in the form of the notion. This demands concentrated attention on the notion as such, on simple and ultimate determinations like being-in-itself, being-for-itself, self-identity, and so on; for these are elemental, pure, self-determined functions of a kind we might call souls, were it not that their conceptual nature denotes something higher than that term contains. The interruption by conceptual thought of the habit of always thinking in figurative ideas (*Vorstellungen*) is as annoying and troublesome to this way of thinking as to that process of formal intelligence which in its reasoning rambles about with no real thoughts to reason with. The former, the habit, may be called materialized thinking, a fortuitous mental state, one that is absorbed in what is material, and hence finds it very distasteful at once to lift its self clear of this matter and be with itself alone. The latter, the process of *raisonnement*,

is, on the other hand, detachment from all content, and conceited superiority to it. What is wanted here is the effort and struggle to give up this kind of freedom, and instead of being a merely arbitrary principle directing the content anyhow, this freedom should sink into and pervade the content, should let it be directed and controlled by its own proper nature, i.e. by the self as its own self. and should observe this process taking place. We must abstain from interrupting the immanent rhythm of the movement of conceptual thought; we must refrain from arbitrarily interfering with it, and introducing ideas and reflections that have been obtained elsewhere. Restraint of this sort is itself an essential condition of attending to and getting at the real nature of the notion.

16. Argumentative thinking in its negative attitude —

There are two aspects in the case of that ratiocinative procedure which mark its contrast from conceptual thinking and call for further notice. *Raisonnement,* in the first place, adopts a negative attitude towards the content apprehended; knows how to refute it and reduce it to nothingness. To see what the content is *not* is merely a negative process; it is a dead halt, which does not of itself go beyond itself, and proceed to a new content; it has to get hold of something else from somewhere or other in order to have once more a content. It is reflection upon and into the empty ego, the vanity of its own knowledge. Conceit of this kind brings out not only that this content is vain and empty, but also that to see this is itself fatuity too: for it is negation with no perception of the positive element within it. In that this reflection does not even have its own negativity as its content, it is not inside actual fact at all, but for ever away outside it. On that account it imagines that by asserting mere emptiness it is going much farther than insight that embraces and reveals a wealth of content. On the other hand, in the case of conceptual thinking, as was above indicated, the negative aspect

falls within the content itself, and is the positive substance of that content, as well as being its inherent character and moving principle as by being the entirety of what these are. Looked at as a result, it is determinate specific negation, the negative which is the outcome of this process, and consequently is a positive content as well.

17. — in its positive attitude; its subject

In view of the fact that ratiocinative thinking has a content, whether of images or thoughts or a mixture of both, there is another side to its process which makes conceptual comprehension difficult for it. The peculiar nature of this aspect is closely connected with the essential meaning of the idea above described, in fact, expresses the idea in the way this appears as the process of thinking apprehension. For just as ratiocinative thinking in its negative reference, which we have been describing, is nothing but the self into which the content returns; in the same way, on the other hand, in its positive cognitive process the self is an ideally presented subject to which the content is related as an accident and predicate. This subject constitutes the basis to which the content is attached and on which the process moves to and fro. Conceptual thinking goes on in quite a different way. Since the concept or notion is the very self of the object, manifesting itself as the development of the object, it is not a quiescent subject, passively supporting accidents: it is a self-determining active concept which takes up its determinations and makes them its own. In the course of this process that inert passive subject really disappears; it enters into the different constituents and pervades the content; instead of remaining in inert antithesis to determinateness of content, it constitutes, in fact, that very specificity, i.e. the content as differentiated along with the process of bringing this about. Thus the solid basis, which ratiocination found in an inert subject, is shaken to its foundations, and the only object is this very

movement of the subject. The subject supplying the concrete filling to its own content ceases to be something transcending. this content, and cannot have further predicates or accidents. Conversely, again, the scattered diversity of the content is brought under the control of the self, and so bound together; the content is not a universal that can be detached from the subject, and adapted to several indifferently. Consequently the content is in truth no longer predicate of the subject; it is the very substance, is the inmost reality, and the very principle of what is being considered. Ideational thinking (*vorstellen*), since its nature consists in dealing with accidents or predicates, and in exercising the right to transcend them because they are nothing more than predicates and accidents — this way of thinking is checked in its course, since that which has in the proposition the form of a predicate is itself the substance of the statement. It is met by a counter-thrust, as we may say. Starting from the subject, as if this were a permanent base on which to proceed, it discovers, by the predicate being in reality the substance, that the subject has passed into the predicate, and has thereby ceased to be subject: and since in this way what seems to be predicate has become the entire mass of the content, whole and complete, thinking cannot wander and ramble about at will, but is restrained and controlled by this weight of content.

Usually the subject is first set down as the fixed and objective self; from this fixed position the necessary process passes on to the multiplicity of determinations or predicates. Here the knowing ego takes the place of that subject and is the function of knitting or combining the predicates one with another, and is the subject holding them fast. But since the former subject enters into the determinate constituents themselves, and is their very life, the subject in the second case — viz. the knowing subject — finds that the former, — which it is supposed to be done with and which it wants to transcend, in order to return into itself, — is still there in the predicate: and

instead of being able to be the determining agency in the process of resolving the predicate — reflectively deciding whether this or that predicate should be attached to the former subject — it has really to deal with the self of the content, is not allowed to be something on its own account (*für sich*), but has to exist along with this content.

What has been said can be expressed in a formal manner by saying that the nature of judgment or the proposition in general, which involves the distinction of subject and predicate, is subverted and destroyed by the speculative judgment; and the identical proposition, which the former becomes [by uniting subject and predicate], implies the rejection and repudiation of the above relation between subject and predicate. This conflict between the form of a proposition in general and the unity of the notion which destroys that form, is similar to what we find between metre and accent in the case of rhythm. Rhythm is the result of what hovers between and unites both. So in the case of the speculative or philosophical judgment; the identity of subject and predicate is not intended to destroy their distinction, as expressed in propositional form; their unity is to arise as a harmony of the elements. The form of the judgment is the way the specific sense appears, or is made manifest, the accent which differentiates the meaning it contains: that the predicate expresses the substance, and the subject itself falls within the universal, is however the unity wherein that accent dies away.

To explain what has been said by examples let us take the proposition God is Being. The predicate is "being": it has substantive significance, and thus absorbs the meaning of the subject within it. Being is meant to be here not predicate but the essential nature. Thereby, God seems to cease to be what he was when the proposition was put forward, viz. a fixed subject. Thinking [i.e. ordinary reflection], instead of getting any farther with the transition from subject to predicate, in reality finds its activity checked

through the loss of the subject, and it is thrown back on the thought of the subject because it misses this subject. Or again, since the predicate has itself been pronounced to be a subject, to be the being, to be the essential reality, which exhausts the nature of the subject, thinking finds the subject directly present in the predicate too: and now, instead of having, in the predicate, gone into *itself,* and preserved the freedom characteristic of ratiocination, it is absorbed in the content all the while, or, at any rate is required to be so.

Similarly when it is said: “the real is the universal”, the real, *qua* subject, passes away in its predicate. The universal is not only meant to have the significance of a predicate, as if the proposition stated that the real is universal: the universal is meant to express the essential nature of the real. Thinking therefore loses that fixed objective basis which it had in the subject, just as much as in the predicate it is thrown back on the subject, and therein returns not into itself but into the subject underlying the content.

This unaccustomed restraint imposed upon thought is for the most part the cause of the complaints concerning the unintelligibility of philosophical writings, when otherwise the individual has in him the requisite mental cultivation for understanding them. In what has been said we see the reason for the specific charge often made against them, that a good deal has to be read repeatedly before it can be understood — an accusation which is meant to convey something improper in the extreme, and one which if granted to be sound admits of no further reply. It is obvious from the above what is the state of the case here. The philosophical proposition, being a proposition, calls up the accepted view of the usual relation of subject and predicate, and suggests the idea of the customary procedure which takes place in knowledge. Its philosophical content destroys this way of proceeding and the ordinary view taken of this process. The common view discovers that the statement is intended in another sense than it is thinking of, and this

correction of its opinion compels knowledge to recur to the proposition and take it now in some other sense.

There is a difficulty which might well be avoided. It consists in mixing up the methods of procedure followed by speculation and ratiocination, when what is said of the subject has at one time the significance of its conceptual principle, and at another time the meaning of its predicate or accidental quality. The one mode of thinking invalidates the other; and only that philosophical exposition can manage to become plastic in character which resolutely sets aside and has nothing to do with the ordinary way of relating the parts of a proposition.

As a matter of fact, non-speculative thinking has its rights too, which are justifiable, but are disregarded in the speculative way of stating a proposition. Abolishing the form of the proposition must not take place only in an immediate manner, through the mere content of the proposition. On the contrary, we must give explicit expression to this cancelling process; it must be not only that internal restraining and confining of thought within its own substance; this turning of the conception back into itself has to be expressly brought out and stated. This process, which constitutes what formerly had to be accomplished by proof, is the internal dialectical movement of the proposition itself. This alone is the concrete speculative element, and only the explicit expression of this is a speculative systematic exposition. *Qua* proposition, the speculative aspect is merely the internal restriction of thought within its own substance where the return of the essential principle into itself is not yet brought out. Hence we often find philosophical expositions referring us to the inner intuition, and thus dispensing with the systematic statement of the dialectical movement of the proposition, which is what we wanted all the while. The proposition ought to express what the truth is: in its essential nature the truth is subject: being so, it is merely the dialectical movement, this self-producing course of

activity, maintaining, its advance by returning back into itself. In the case of knowledge in other spheres this aspect of expressly stating the internal nature of the content is constituted by proof. When dialectic, however, has been separated from proof, the idea of philosophical demonstration as a matter of fact has vanished altogether.

On this point it may be mentioned that the dialectical process likewise consists of parts or elements which are propositions. The difficulty indicated seems therefore to recur continually, and seems to be a difficulty inherent in the nature of the case. This is like what happens in the ordinary process of proving anything; the grounds it makes use of need themselves to be based on other grounds again, and so on *ad infinitum*. This manner of furnishing grounds and conditions, however, concerns that type of proof from which the dialectical movement is distinct and hence belongs to the process of external knowledge. As to what this movement is, its element is the bare concept; this furnishes a content which is through and through subject *impliciter* and *per se.* There is to be found, therefore, no sort of content standing in a relation, as it were, to an underlying subject, and getting its significance by being attached to this as a predicate. The proposition as it appears is a mere empty form.

Apart from the sensuously apprehended or ideally presented (*vorgestellten*) self, it is in the main the mere name *qua* name which denotes the subject pure and simple, the empty unit without any conceptual character. For this reason it would e.g. be expedient to avoid the name "God", because this word is not in its primary use a conception as well, but the special name of an underlying subject, its fixed resting-place; while, on the other hand, being or the one, singleness, subject, etc., themselves directly indicate conceptions. Furthermore, if speculative truths are stated about that subject [God], even then their content is devoid of the immanent notion, because that content is merely present in the form of a passive

subject, and owing to this the speculative truths easily take on the character of mere edification. From this side, too, the obstacle, arising from the habit of putting the speculative predicate in the form of a proposition, instead of taking it as an inherent essential conception, is capable of being made greater or less by the mere way philosophical truths are put forward. Philosophical exposition, faithfully following its insight into the nature of speculative truth, must retain the dialectical form, and exclude everything which is not grasped conceptually and is conception.

Just as much as in the procedure of ratiocination, the study of philosophy finds obstruction, too, in the unreasoning conceit that builds itself on well-established truths, which the possessor considers he has no need to return upon and reconsider, but rather takes to be fundamental, and thinks he can by means thereof propound as well as decide and pass sentence. In this regard, it is especially needful to make once again a serious business of philosophy. In all spheres of science, art, skill, and handicraft it is never doubted that, in order to master them, a considerable amount of trouble must be spent in learning and in being trained. As regards philosophy, on the contrary, there seems still an assumption prevalent that, though every one with eyes and fingers is not on that account in a position to make shoes if he only has leather and a last, yet everybody understands how to philosophize straight away, and pass judgment on philosophy, simply because he possesses the criterion for doing so in his natural reason — as if he did not in the same way possess the standard for shoemaking too in his own foot. It seems as if the possession of philosophy lay just in the want of knowledge and study, as if philosophy left off where the latter began. It, is commonly held to be a formal kind of knowledge devoid of all substantial content. There is a general failure to perceive that, in the case of any knowledge, and any science, what is taken for truth, even as regards content, can only deserve the name of "truth" when philosophy has had a

hand in its production. Let the other sciences try as much as they like to get along by ratiocination or *raisonnement* without philosophy, they are unable to keep alive without it, or to have any spiritual significance and truth in them.

18. Natural philosophizing as healthy common sense and as genius

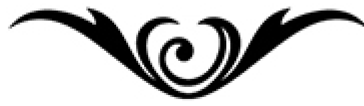
As regards philosophy in its proper and genuine sense, we find put forward without any hesitation, as an entirely sufficient equivalent for the long course of mental discipline — for that profound and fruitful process through which the human spirit attains to knowledge — the direct revelation of the divine and the healthy common sense of mankind, unconcerned with and undisciplined by any other knowledge or by proper philosophical reflection. These are held to be a good substitute for real philosophy, much in the way that chicory is lauded as a substitute for coffee. It is not a very pleasing spectacle to observe uncultivated ignorance and crudity of mind, with neither form nor taste, without the capacity to concentrate its thoughts on an abstract proposition, still less on a connected statement of such propositions, confidently proclaiming itself to be intellectual freedom and toleration, and even the inspiration of genius. This last used once upon a time, as everyone knows, to be all the vogue in the case of poetry, as it is now in philosophy. Instead of poetry, however, the efforts of this form of inspiration, when it had any sense at all, resulted in the production of trivial prose, or, if it went beyond that, it produced raving harangues. In the same way here in the case of philosophy; philosophizing by the light of nature, which thinks itself too good for conceptual thinking, and, because of the want of it, takes itself to have direct intuitive ideas and poetical thoughts — such philosophizing trades in arbitrary combinations of an imagination merely disorganized through thinking — fictitious creations that are neither fish nor flesh, neither poetry nor philosophy.

On the other hand again, when instinctive philosophy follows the more secure course prescribed by healthy common sense, it treats us to a rhetorical *mélange* of commonplace truths. When it is charged with the triviality of what it offers, it assures us, in reply, that the fullness and richness of its meaning lie deep down in its own heart, and that others must feel this too, since with such phrases as the "heart's natural innocence", "purity of conscience", and so on, it supposes it has expressed things that are ultimate and final, to which no one can take exception, and about which nothing further can be required. But the very problem in hand was just that the best must not be left behind hidden away in secret, but be brought out of the depths and set forth in the light of day. It could quite well from the start have spared itself the trouble of bringing forward ultimate and final truths of that sort; they were long since to be found, say, in the Catechism, in popular proverbs, etc. It is an easy matter to grasp such truths in their indefinite and crooked inaccurate form, and in many cases to point out that the mind convinced of them is conscious of the very opposite truths. When it struggles to get itself out of the mental embarrassment thereby produced, it will tumble into further confusion, and possibly burst out with the assertion that in short and in fine the matter is settled, the truth is so and so, and anything else is mere "sophistry" — a password used by plain common sense against cultivated critical reason, like the phrase "visionary dreaming", by which those ignorant of philosophy sum up its character once for all. Since the man of common sense appeals to his feeling, to an oracle within his breast, he is done with any one who does not agree. He has just to explain that he has no more to say to any one who does not find and feel the same as himself. In other words, he tramples the roots of humanity underfoot. For the nature of humanity is to impel men to agree with one another, and its very existence lies simply in the explicit realization of a community of conscious life. What is anti-human, the condition of mere

animals, consists in keeping within the sphere of feeling pure and simple, and in being able to communicate only by way of feeling-states.

When a man asks for a royal road to science, no more convenient and comfortable way can be mentioned to him than to put his trust in “healthy common sense”. And for the rest, to keep abreast of the times and advance with philosophy, let him read reviews of philosophical works, and even go the length of reading the prefaces and first paragraphs of the works themselves; for the latter give the general principles on which everything turns, while the reviews along with the historical notice provide over and above the critical judgment and appreciation, which, being a judgment passed on the work, goes farther than the work that is judged. This common way a man can take in his dressing-gown. But spiritual elation in the eternal, the sacred, the infinite, moves along the highway of truth in the robes of the high priests road that, from the first, is itself immediate being in its innermost, the inspiration of profound and original ideas and flashes of elevated thought. All the same, those depths do not yet reveal the well-spring of inner reality; nor, again, are these sky-rockets the empyrean. True thoughts and scientific insight can only be won by the labour of the notion. Conceptions alone can produce universality in the knowing process. This universality is critically developed and completely finished knowledge. It is not the common indefiniteness and inadequacy of ordinary intelligence. Nor, again, is it that extraordinary kind of universality where the powers and potencies of reason are spoiled and ruined by genius through indolence and self-conceit. It is truth which has successfully reached its own inherent native form. It is this universality which is capable of being the property of every self-conscious reason.

19. Conclusion: the author’s relation to the public



Since I have taken the self-development of the notion to be the medium wherein science really exists, and since in those respects to which I have drawn attention, as well as in others, current ideas about the nature of truth and the shape it assumes deviate from my view, and indeed are quite opposed to my position, the consideration of this divergence of view does not seem to promise well for a favourable reception of an attempt to expound the system of science in this sense. In the meantime, I may call to mind that while e.g. the supreme merit of Plato's philosophy has sometimes been held to consist in his myths which are scientifically valueless, there have also been times, spoken of even as times of mere sentimental enthusiasm, when the Aristotelian philosophy has been respected on account of its speculative depth of insight, and when the *Parmenides* of Plato — perhaps the greatest literary product of ancient dialectic — has been taken to be the positive expression of the divine life, the unveiling and disclosing of its inmost truth. I may reflect, too, that notwithstanding much cloudy obscurity which was the product of ecstasy, this misunderstood ecstasy was in point of fact meant to be nothing else than the activity of the pure notion; furthermore, that what is best in the philosophy of our time takes its value to lie in its scientific character; and that, even though others take a different view, it is only in virtue of its scientific character that recent philosophy really gains validity and acceptance. Thus, then, I may hope too that this attempt to justify the claim of science to be a conceptual process, and systematically to develop and present science in this its own peculiar medium, will manage to make a way for itself by the inherent truth of the result accomplished. We may rest assured that it is the nature of truth to force its way to recognition when the time comes, and that it only appears when its time has come, and hence never appears too soon, and never finds a public that is not ripe to receive it. And, further, we may be sure that the individual thinker requires this result to take place, in order to give him

confidence in regard to what is no more as yet than a matter for himself singly and alone, and in order to find his assurance, which in the first instance merely belongs to a particular individual, realized as something universal. In this connection, however, it is very often necessary to distinguish the public from those who take upon themselves to be its representatives and spokesmen. The public takes up an attitude in many respects quite different from the latter, indeed, even opposed to them. Whereas the public good-naturedly and generously will rather take the blame upon itself when a philosophical work is not quite acceptable or intelligible to it, these "representatives", on the contrary, convinced of their own competence, put all the blame on the authors. The influence of the work on the public is more silent than the action of those "representatives", who are like the dead burying their dead. While the general level of insight at the present time is in the main more highly cultivated, its curiosity more quickened and alert, and its judgment more swiftly made up and pronounced, so that the feet of those who will carry you out are already at the door: at the same time we have often to distinguish from all this the slower and more gradual effect which rectifies the direction of attention caught and compelled by imposing assurances, corrects, too, contemptuous censure, and after a little provides a contemporary audience for one part, while another after a temporary vogue finds no audience with posterity any longer.

For the rest, at a time when the universal nature of spiritual life has become so very much emphasized and strengthened, and the mere individual aspect has become, as it should be, correspondingly a matter of indifference, when, too, that universal aspect holds, by the entire range of its substance, the full measure of the wealth it has built up, and lays claim to it all, the share in the total work of mind that falls to the activity of any particular individual can only be very small. Because this is so, the

individual must all the more forget himself, as in fact the very nature of science implies and requires that he should; and he must, moreover, become and do what he can. But all the less must be demanded of him, just as he can expect the less from himself, and may ask the less for himself.

Introduction

IT IS NATURAL to suppose that, before philosophy enters upon its subject proper-namely, the actual knowledge of what truly is-it is necessary to come first to an understanding concerning knowledge, which is looked upon as the instrument by which to take possession of the Absolute, or as the means through which to get a sight of it. The apprehension seems legitimate, on the one hand that there may be various kinds of knowledge, among which one might be better adapted than another for the attainment of our purpose-and thus a wrong choice is possible: on the other hand again that, since knowing is a faculty of a definite kind and with a determinate range, without the more precise determination of its nature and limits we might take hold on clouds of error instead of the heaven of truth.

This apprehensiveness is sure to pass even into the conviction that the whole enterprise which sets out to secure for consciousness by means of knowledge what exists *per se,* is in its very nature absurd; and that between knowledge and the Absolute there lies a boundary which completely cuts off the one from the other. For if knowledge is the instrument by which to get possession of absolute Reality, the suggestion immediately occurs that the application of an instrument to anything does *not* leave it as it is for itself, but rather entails in the process, and has in view, a moulding and alteration of it. Or, again, if knowledge is not an instrument which we actively employ, but a kind of passive medium through which the light of the truth reaches us, then here, too, we do not receive it as it is in itself. but as it is through and in this medium. In either case we employ a means which immediately brings about the very opposite of its own end; or, rather, the absurdity lies in making use of any means at all. It seems indeed open to us

to find in the knowledge of the way in which the *instrument* operates, a remedy for this parlous state; for thereby it becomes possible to remove from the result the part which, in our idea of the Absolute received through that instrument, belongs to the instrument, and thus to get the truth in its purity. But this improvement would, as a matter of fact, only bring us back to the point where we were before. If we take away again from a definitely formed thing that which the instrument has done in the shaping of it, then the thing (in this case the Absolute) stands before us once more just as it was previous to all this trouble, which, as we now see, was superfluous. If the Absolute were only to be brought on the whole nearer to us by this agency, without any chance being, wrought in it, like a bird caught by a limestick, it would certainly scorn a trick of that sort, if it were not in its very nature, and did it not wish to be, beside us from the start. For a trick is what knowledge in such a case would be, since by all its busy toil and trouble it gives itself the air of doing something quite different from bringing about a relation that is merely immediate, and so a waste of time to establish. Or, again, if the examination of knowledge, which we represent as a medium, makes us acquainted with the law of its refraction, it is likewise useless to eliminate this refraction from the result. For knowledge is not the divergence of the ray, but the ray itself by which the truth comes in contact with us; and if this be removed, the bare direction or the empty place would alone be indicated.

Meanwhile, if the fear of falling into error introduces an element of distrust into science, which without any scruples of that sort goes to work and actually does know, it is not easy to understand why, conversely, a distrust should not be placed in this very distrust, and why we should not take care lest the fear of error is not just the initial error. As a matter of fact, this fear presupposes something, indeed a great deal, as truth, and supports its scruples and consequences on what should itself be examined

beforehand to see whether it is truth. It starts with ideas of knowledge as an instrument, and as a medium; and presupposes a distinction of ourselves from this knowledge. More especially it takes for granted that the Absolute stands on one side, and that knowledge on the other side, by itself and cut off from the Absolute, is still something real; in other words, that knowledge, which, by being outside the Absolute, is certainly also outside truth, is nevertheless true — a position which, while calling itself fear of error, makes itself known rather as fear of the truth.

This conclusion comes from the fact that the Absolute alone is true or that the True is alone absolute, It may be set aside by making the distinction that a know ledge which does not indeed know the Absolute as science wants to do, is none the less true too; and that knowledge in general, though it may possibly be incapable of grasping the Absolute, can still be capable of truth of another kind. But we shall see as we proceed that random talk like this leads in the long run to a confused distinction between the absolute truth and a truth of some other sort, and that "absolute", "knowledge", and so on, are words which presuppose a meaning that has first to be got at.

With suchlike useless ideas and expressions about knowledge, as an instrument to take hold of the Absolute, or as a medium through which we have a glimpse of truth, and so on (relations to which all these ideas of a knowledge which is divided from the Absolute and an Absolute divided from knowledge in the last resort lead), we need not concern ourselves. Nor need we trouble about the evasive pretexts which create the incapacity of science out of the presupposition of such relations, in order at once to be rid of the toil of science, and to assume the air of serious and zealous effort about it. Instead of being troubled with giving answers to all these, they may be straightway rejected as adventitious and arbitrary ideas; and the use which is here made of words like "absolute", "knowledge", as also "objective" and "subjective", and innumerable others, whose meaning is

assumed to be familiar to everyone, might well be regarded as so much deception. For to give out that their significance is universally familiar and that everyone indeed possesses their notion, rather looks like an attempt to dispense with the only important matter, which is just to give this notion. With better right, on the contrary, we might spare ourselves the trouble of talking any notice at all of such ideas and ways of talking which would have the effect of warding off science altogether; for they make a mere empty show of knowledge which at once vanishes when science comes on the scene.

But science, in the very fact that it comes on the scene, is itself a phenomenon; its "coming on the scene" is not yet *itself* carried out in all the length and breadth of its truth. In this regard, it is a matter of indifference whether we consider that it (science) is the phenomenon because it makes its appearance alongside another kind of knowledge, or call that other untrue knowledge its process of appearing. Science, however, must liberate itself from this phenomenality, and it can only do so by turning against it. For science cannot simply reject a form of knowledge which is not true, and treat this as a common view of things, and then assure us that itself is an entirely different kind of knowledge, and holds the other to be of no account at all; nor can it appeal to the fact that in this other there are presages of a better. By giving that assurance it would declare its force and value to lie in its bare existence; but the untrue knowledge appeals likewise to the fact that it *is*, and assures us that to it *science* is nothing. One barren assurance, however, is of just as much value as another. Still less can science appeal to the presages of a better, which are to be found present in untrue knowledge and are there pointing the way towards science; for it would, on the one hand, be appealing again in the same way to a merely existent fact; and, on the other, it would be appealing to itself, to the way in which it exists in untrue knowledge, i.e. to a bad form of its own existence, to its appearance,

rather than to its real and true nature (*an und für sich*). For this reason we shall here undertake the exposition of knowledge as a phenomenon.

Now because this exposition has for its object only phenomenal knowledge, the exposition itself seems not to be science, free, self-moving in the shape proper to itself, but may, from this point of view, be taken as the pathway of the natural consciousness which is pressing forward to true knowledge. Or it can be regarded as the path of the soul, which is traversing the series of its own forms of embodiment, like stages appointed for it by its own nature, that it may possess the clearness of spiritual life when, through the complete experience of its own self, it arrives at the knowledge of what it is in itself.

Natural consciousness will prove itself to be only knowledge in principle or not real knowledge. Since, however, it immediately takes itself to be the real and genuine knowledge, this pathway has a negative significance for it; what is a realization of the notion of knowledge means for it rather the ruin and overthrow of itself; for on this road it loses its own truth. Because of that, the road can be looked on as the path of doubt, or more properly a highway of despair. For what happens there is not what is usually understood by doubting, a jostling against this or that supposed truth, the outcome of which is again a disappearance in due course of the doubt and a return to the former truth, so that at the end the matter is taken as it was before. On the contrary, that pathway is the conscious insight into the untruth of the phenomenal knowledge, for which that is the most real which is after all only the unrealized notion. On that account, too, this thoroughgoing scepticism is not what doubtless earnest zeal for truth and science fancies it has equipped itself with in order to be ready to deal with them — viz. the *resolve,* in science, not to deliver itself over to the thoughts of others on their mere authority, but to examine everything for itself, and

only follow its own conviction, or, still better, to produce everything itself and hold only its own act for true.

The series of shapes, which consciousness traverses on this road, is rather the detailed history of the process of training and educating consciousness itself up to the level of science. That resolve presents this mental development (*Bildung*) in the simple form of an intended purpose, as immediately finished and complete, as having taken place; this pathway, on the other hand, is, as opposed to this abstract intention, or untruth, the actual carrying out of that process of development. To follow one's own conviction is certainly more than to hand oneself over to authority; but by the conversion of opinion held on authority into opinion held out of personal conviction, the content of what is held is not necessarily altered, and truth has not thereby taken the place of error. If we stick to a system of opinion and prejudice resting on the authority of others, or upon personal conviction, the one differs from the other merely in the conceit which animates the latter. Scepticism, directed to the whole compass of phenomenal consciousness, on the contrary, makes mind for the first time qualified to test what truth is; since it brings about a despair regarding what are called natural views, thoughts, and opinions, which it is matter of indifference to call personal or belonging to others, and with which the consciousness, that proceeds straight away to criticize and test, is still filled and hampered, thus being, as a matter of fact, incapable of what it wants to undertake.

The completeness of the forms of unreal consciousness will be brought about precisely through the necessity of the advance and the necessity of their connection with one another. To make this comprehensible we may remark, by way of preliminary, that the exposition of untrue consciousness in its untruth is not a merely negative process. Such a one-sided view of it is what the natural consciousness generally adopts; and a knowledge, which

makes this one-sidedness its essence, is one of those shapes assumed by incomplete consciousness which falls into the course of the inquiry itself and will come before us there. For this view is scepticism, which always sees in the result only pure nothingness, and abstracts from the fact that this nothing is determinate, is the nothing of *that out of which* it comes as a result. Nothing, however, is only, in fact, the true result, when taken as the nothing of what it comes from; it is thus itself a determinate nothing, and has a content. The scepticism which ends with the abstraction "nothing" or "emptiness" can advance from this not a step farther, but must wait and see whether there is possibly anything new offered, and what that is-in order to cast it into the same abysmal void. When once, on the other hand, the result is apprehended, as it truly is, as *determinate* negation, a new form has thereby immediately arisen; and in the negation the transition is made by which the progress through the complete succession of forms comes about of itself.

The goal, however, is fixed for knowledge just as necessarily as the succession in the process. The terminus is at that point where knowledge is no longer compelled to go beyond itself, where it finds its own self, and the notion corresponds to the object and the object to the notion. The progress towards this goal consequently is without a halt, and at no earlier stage is satisfaction to be found. That which is confined to a life of nature is unable of itself to go beyond its immediate existence; but by something other than itself it is forced beyond that; and to be thus wrenched out of its setting is its death. Consciousness, however, is to itself its own notion; thereby it immediately transcends what is limited, and, since this latter belongs to it, consciousness transcends its own self. Along with the particular there is at the same time set up the "beyond", were this only, as in spatial intuition, *beside* what is limited. Consciousness, therefore, suffers this violence at its own hands; it destroys its own limited satisfaction. When feeling of

violence, anxiety for the truth may well withdraw, and struggle to preserve for itself that which is in danger of being lost. But it can find no rest. Should that anxious fearfulness wish to remain always in unthinking indolence, thought will agitate the thoughtlessness, its restlessness will disturb that indolence. Or let it take its stand as a form of sentimentality which assures us it finds everything good in its kind, and this assurance likewise will suffer violence at the hands of reason, which finds something *not* good just because and in so far as it is a *kind*. Or, again, fear of the truth may conceal itself from itself and others behind the pretext that precisely burning zeal for the very truth makes it so difficult, nay impossible, to find any other truth except that of which alone vanity is capable-that of being ever so much cleverer than any ideas, which one gets from oneself or others, could make possible. This sort of conceit which understands how to belittle every truth and turn away from it back into itself, and gloats over this its own private understanding, which always knows how to dissipate every possible thought, and to find, instead of all the content, merely the barren Ego-this is a satisfaction which must be left to itself; for it flees the universal and seeks only an isolated existence on its own account (*Fürsichseyn*).

As the foregoing has been stated, provisionally and in general, concerning the manner and the necessity Of the process of the inquiry, it may also be of further service to make some observations regarding the method of carrying this out. This exposition, viewed as a process of relating science to phenomenal knowledge, and as an inquiry and critical examination into the reality of knowing, does not seem able to be effected without some presupposition which is laid down as an ultimate criterion. For an examination consists in applying an accepted standard, and, on the final agreement or disagreement therewith of what is tested, deciding whether the latter is right or wrong; and the standard in general, and so science, were this the criterion, is thereby accepted as the essence or

inherently real *(Ausich)*. But, here,. where science first appears on the scene, neither science nor any sort of standard has justified itself as the essence or ultimate reality; and without this no examination seems able to be instituted.

This contradiction and the removal of it will become more definite if, to begin with, we call to mind the abstract determinations of knowledge and of truth as they are found in consciousness. Consciousness, we find, *distinguishes* from itself something, to which at the same time it *relates* itself; or, to use the current expression, there is something *for* consciousness; and the determinate form of this process of relating, or of there being something for a consciousness, is knowledge. But from this being for another we distinguish being in itself or *per se;* what is related to knowledge is likewise distinguished from it, and posited as also existing outside this relation; the aspect of being *per se* or in itself is called Truth. What really lies in these determinations does not further concern us here; for since the object of our inquiry is phenomenal knowledge., its determinations are also taken up, in the first instance, as they are immediately offered to us. And they are offered to us very much in the way we have just stated.

If now our inquiry deals with the truth of knowledge, it appears that we are inquiring what knowledge is in itself. But in this inquiry knowledge is *our* object, it is *for us*; and the essential nature (*Ansich*) of knowledge, were this to come to light, would be rather its being *for us:* what we should assert to be its essence would rather be, not the truth of knowledge, but only our knowledge of it. The essence or the criterion would lie in us; and that which was to be compared with this standard, and on which a decision was to be passed as a result of this comparison, would not necessarily have to recognize that criterion.

But the nature of the object which we are examining surmounts this separation, or semblance of separation, and presupposition. Consciousness furnishes its own criterion in itself, and the inquiry will thereby be a comparison of itself with its own self; for the distinction, just made, falls inside itself. In consciousness there is one element *for* an other, or, in general, consciousness implicates the specific character of the moment of knowledge. At the same time this "other" is to consciousness not merely *for it,* but also outside this relation, or has a being in itself, i.e. there is the moment of truth. Thus in what consciousness inside itself declares to be the essence or truth we have the standard which itself sets up, and by which we are to measure its knowledge. Suppose we call knowledge the notion, and the essence or truth "being" or the object, then the examination consists in seeing whether the notion corresponds with the object. But if we call the inner nature of the object, or what it is in itself, the notion, and, on the other side, understand by object the notion *qua* object, i.e. the way the notion is *for* an other, then the examination consists in our seeing whether the object corresponds to its own notion. It is clear, of course, that both of these processes are the same. The essential fact, however, to be borne in mind throughout the whole inquiry is that both these moments, notion and object, "being for another" and "being in itself", themselves fall within that knowledge which we are examining. Consequently we do not require to bring standards with us, nor to apply our fancies and thoughts in the inquire; and just by our leaving these aside we are enabled to treat and discuss the subject as it actually is in itself and for itself, as it is in its complete reality.

But not only in this respect, that notion and object, the criterion and what is to be tested, are ready to hand in consciousness itself, is any addition of ours superfluous, but we are also spared the trouble of comparing these two and of making an examination in the strict sense of the term; so that in this respect, too, since consciousness tests and examines itself, all we are left to

do is simply and solely to look on. For consciousness is, on the one hand, consciousness of the object, on the other, consciousness of itself; consciousness of what to it is true, and consciousness of its knowledge of that truth. Since both are for the same consciousness, it is itself their comparison; it is the same consciousness that decides and knows whether its knowledge of the object corresponds with this object or not. The object, it is true, appears only to be in such wise for consciousness as consciousness knows it. Consciousness does not seem able to get, so to say, behind it as it is, not for consciousness, but in itself, and consequently seems also unable to test knowledge by it. But just because consciousness has, in general, knowledge of an object, there is already present the distinction that the inherent nature, what the object is in itself, is one thing to consciousness, while knowledge, or the being of the object *for* consciousness, is another moment. Upon this distinction, which is present as a fact, the examination turns. Should both, when thus compared, not correspond, consciousness seems bound to alter its knowledge, in order to make it fit the object. But in the alteration of the knowledge, the object itself also, in point of fact, is altered; for the knowledge which existed was essentially a knowledge of the object; with change in the knowledge, the object also becomes different, since it belonged essentially to this knowledge. Hence consciousness comes to find that what formerly to it was the essence is not what is *per se,* or what was *per se* was only *per se for consciousness.* Since, then, in the case of its object consciousness finds its knowledge not corresponding with this object, the object likewise fails to hold out; or the standard for examining is altered when that, whose criterion this standard was to be, does not hold its ground in the course of the examination; and the examination is not only an examination of knowledge, but also of the criterion used in the process.

This dialectic process which consciousness executes on itself-on its knowledge as well as on its object — in the sense that out of it the new and true object arises, is precisely, what is termed Experience. In this connection, there is a moment in the process just mentioned which should be brought into more decided prominence, and by which a new light is cast on the scientific aspect of the following exposition. Consciousness knows something; this something is the essence or is *per se.* This object, however, is also the *per se*, the inherent reality, *for consciousness.* Hence comes ambiguity of this truth. Consciousness, as we see, has now two objects: one is the first *per se,* the second is the existence *for consciousness* of this *per se.* The last object appears at first sight to be merely the reflection of consciousness into itself, i.e. an idea not of an object, but solely of its knowledge of that first object. But, as was already indicated, by that very process the first object is altered; it ceases to be what is *per se,* and becomes consciously something which is *per se* only *for consciousness.* Consequently, then, what this real *per se* is for consciousness is truth: which, however, means that this is the essential reality, or the object which consciousness has. This new object contains the nothingness of the first; the new object is the experience concerning that first object.

In this treatment of the course of experience, there is an element in virtue of which it does not seem to be in agreement with what is ordinarily understood by experience. The transition from the first object and the knowledge of it to the other object, in regard to which we say we have had experience, was so stated that the knowledge of the first object, the existence *for consciousness* of the first *ens per se*, is itself to be the second object. But it usually seems that we learn by experience the untruth of our first notion by appealing to some other object which we may happen to find casually and externally; so that, in general, what we have is merely the bare and simple apprehension of what is in and for itself. On the view above

given, however, the new object is seen to have come about by a transformation or conversion of consciousness itself. This way of looking at the matter is *our* doing, what *we* contribute; by its means the series of experiences through which consciousness passes is lifted into a scientifically constituted sequence, but this does not exist for the consciousness we contemplate and consider. We have here, however, the same sort of circumstance, again, of which we spoke a short time ago when dealing with the relation of this exposition to scepticism, viz. that the result which at any time comes about in the case of an untrue mode of knowledge cannot possibly collapse into an empty nothing, but must necessarily be taken as the negation of that of which it is a result-a result which contains what truth the preceding mode of knowledge has in it. In the present instance the position takes this form: since what at first appeared as object is reduced, when it passes into consciousness, to what knowledge takes it to be, and the implicit nature, the real in itself, becomes what this entity *per se*, is *for consciousness*; this latter is the new object, whereupon there appears also a new mode or embodiment of consciousness, of which the essence is something other than that of the preceding mode. It is this circumstance which carries forward the whole succession of the modes or attitudes of consciousness in their own necessity. It is only this necessity, this origination of the new object-which offers itself to consciousness without consciousness knowing how it comes by it-that to us, who watch the process, is to be seen going on, so to say, behind its back. Thereby there enters into its process a moment of being *per se,* or of being for us, which is not expressly presented to that consciousness which is in the grip of experience itself. The *content*, however, of what we see arising, exists for it, and we lay hold of and comprehend merely its formal character, i.e. its *bare* origination; *for it*, what has thus arisen has merely the character of object,

while, *for us*, it appears at the same time as a process and coming into being.

In virtue of that necessity this pathway to science is itself *eo ipso* science, and is, moreover, as regards its content, Science of the Experience of Consciousness.

The experience which consciousness has concerning itself can, by its essential principle, embrace nothing less than the entire system of consciousness, the whole realm of the truth of mind, and in such wise that the moments of truth are set forth in the specific and peculiar character they here possess — i.e. not as abstract pure moments, but as they are for consciousness, or as consciousness itself appears in its relation to them, and in virtue of which they are moments of the whole, are embodiments or modes of consciousness. In pressing forward to its true form of existence, consciousness will come to a point at which it lays aside its semblance of being hampered with what is foreign to it, with what is only for it and exists as an other; it will reach a position where appearance becomes identified with essence, where, in consequence, its exposition coincides with just this very point, this very stage of the science proper of mind. And, finally, when it grasps this its own essence, it will connote the nature of absolute knowledge itself.

A. Consciousness

(In addition to the works mentioned on (note), the reader may be referred to the analysis of Sensation and Perception in Plato's *Theaetetus*, and to Bradley's *Appearance and Reality*, Chaps. II, V, VIII and XIX.)

I. CERTAINTY AT THE LEVEL OF SENSE-EXPERIENCE — THE "THIS", AND "MEANING"

THE KNOWLEDGE, WHICH is at the start or immediately our object, can be nothing else than just that which is immediate knowledge, knowledge of the immediate, of what *is*. We have, in dealing with it, to proceed, too, in an immediate way, to accept what is given, not altering anything in it as it is presented before us, and keeping mere apprehension (*Auffassen*) free from conceptual comprehension (*Begreifen*).

The concrete content, which sensuous certainty furnishes, makes this *prima facie* appear to be the richest kind of knowledge, to be even a knowledge of endless wealth — a wealth to which we can as little find any limit when we traverse its *extent* in space and time, where that content is presented before us, as when we take a fragment out of the abundance it offers us and by dividing and dividing seek to penetrate its *intent*. Besides that. it seems to be the truest, the most authentic knowledge: for it has not as yet dropped anything from the object; it has the object before itself in its entirety and completeness. This bare fact of *certainty*, however, is really and admittedly the abstractest and the poorest kind of *truth*. It merely says regarding what it knows: it *is*; and its truth contains solely the *being* of the fact it knows. Consciousness, on its part, in the case of this form of certainty, takes the shape merely of pure Ego. In other words, I in such a case am merely *qua* pure This, and the object likewise is merely *qua* pure This. I, *this* particular conscious I, am certain of *this* fact before me, not because I *qua* consciousness have developed myself in connection with it and in manifold ways set thought to work about it: and not, again, because the fact, the thing, of which I am certain, in virtue of its having a multitude

of distinct qualities, was replete with possible modes of relation and a variety of connections with other things. Neither has anything to do with the truth sensuous certainty contains: neither the I nor the thing has here the meaning of a manifold relation with a variety of other things, of mediation in a variety of ways. The I does not contain or imply a manifold of ideas, the I here does not *think*: nor does the thing mean what has a multiplicity of qualities. Rather, the thing, the fact, *is*; and it *is* merely because it *is*. It *is* — that is the essential point for sense-knowledge, and that bare fact of *being*, that simple immediacy, constitutes its truth. In the same way the certainty *qua relation*, the certainty "of" something, is an immediate pure relation; consciousness is I — nothing more, a pure *this;* the *individual* consciousness knows a pure *this,* or knows what is *individual*.

But, when we look closely, there is a good deal more implied in that bare pure being, which constitutes the kernel of this form of certainty, and is given out by it as its truth. A concrete actual certainty of sense is not merely this pure immediacy, but an example, an instance, of that immediacy. Amongst the innumerable distinctions that here come to light, we find in all cases the fundamental difference — viz. that in sense-experience pure being at once breaks up into the two "thises", as we have called them, one this as I, and one as object. When *we* reflect on this distinction, it is seen that neither the one nor the other is merely immediate, merely *is* in sense-certainty, but is at the same time *mediated*: I have the certainty through the other, viz. through the actual fact; and this, again, exists in that certainty through an other, viz. through the I.

It is not only we who make this distinction of essential truth and particular example, of essence and instance, immediacy and mediation; we *find* it in sense-certainty itself, and it has to be taken up in the form in which it exists there, not as we have just determined it. One of them is put forward in it as existing in simple immediacy, as the essential reality, the *object.* The

other, however, is put forward as the non-essential, as *mediated*, something which is not *per se* in the certainty, but there through something else, ego, a state of knowledge which only knows the object because the *object* is, and which can as well be as *not* be. The object, however, is the real truth, is the essential reality; it *is,* quite indifferent to whether it is known or not; it remains and stands even though it is not known, while the knowledge does not exist if the object is not there.

We have thus to consider as to the object, whether in point of fact it does exist in sense-certainty itself as such an essential reality as that certainty gives it out to be; whether its meaning and notion, which is to be essential reality, corresponds to the way it is present in that certainty. We have for that purpose not to reflect about it and ponder what it might be in truth, but to deal with it merely as sense-certainty contains it.

Sense-certainty itself has thus to be asked: What is the This? If we take it in the two-fold form of its existence, as the *Now* and as the *Here*, the dialectic it has in it will take a form as intelligible as the This itself. To the question, What is the Now? we reply, for example, the Now is night-time. To test the truth of this certainty of sense, a simple experiment is all we need: write that truth down. A truth cannot lose anything by being written down, and just as little by our preserving and keeping it. If we look again at the truth we have written down, look at it *now*, *at this* noon-time, we shall have to say it has turned stale and become out of date.

The Now that is night is kept fixed, i.e. it is treated as what it is given out to be, as something which *is*; but it proves to be rather a something which is *not*. The Now itself no doubt maintains itself, but as what is *not* night; similarly in its relation to the day which the Now is at present, it maintains itself as something that is also not day, or as altogether something negative. This self-maintaining Now is therefore not something immediate but something mediated; for, *qua* something that remains and preserves itself, it

is determined through and *by means* of the fact that something else, namely day and night, is *not*. Thereby it is just as much as ever it was before, Now, and in being this simple fact, it is indifferent to what is still associated with it; just as little as night or day is its being, it is just as truly *also* day and night; it is not in the least affected by this otherness through which it is what it is. A simple entity of this sort, which is by and through negation, which is neither this nor that, which is a *not-this*, and with equal indifference this as well as that — a thing of this kind we call a Universal. The Universal is therefore in point of fact the truth of sense-certainty, the true content of sense-experience.

It is as a universal, too, that we give utterance to sensuous fact. What we say is: "This", i.e. the universal this; or we say: "it is", i.e. being in general. Of course we do not present before our mind in saying, so the universal this, or being in general, but we *utter* what is universal; in other words, we do not actually and absolutely say what in this sense-certainty we really *mean*. Language, however, as we see, is the more truthful; in it we ourselves refute directly and at once our own "meaning"; and since universality is the real truth of sense-certainty, and language merely expresses *this* truth, it is not possible at all for us even to express in words any sensuous existence which we "mean".

The same will be the case when we take the *Here*, the other form of the This. The Here is e.g. the tree. I turn about and this truth has disappeared and has changed round into its opposite: the Here, is not a tree, but a house. The Here itself does not disappear; it *is* and remains in the disappearance of the house, tree, and so on, and is indifferently house, tree. The This is shown thus again to be *mediated simplicity,* in other words, to be *universality.*

Pure being, then, remains as the essential element for this sense-certainty, since sense-certainty in its very nature proves the universal to be

the truth of its object. But that pure being is not in the form of something immediate, but of something in which the process of negation and mediation is essential. Consequently it is not what we *intend* or "mean" by being, but being with the characteristic that it is an abstraction, the purely universal; and our intended "meaning", which takes the truth of sense-certainty to be *not* something universal, is alone left standing in contrast to this empty. indifferent Now and Here.

If we compare the relation in which knowledge and the object first stood with the relation they have come to assume in this result, it is found to be just the reverse of what first appeared. The object, which professed to be the essential reality, is now the non-essential element of sense-certainty; for the universal, which the object has come to be, is no longer such as the object essentially was to be for sense-certainty. The certainty is now found to lie in the opposite element, namely in knowledge, which formerly was the non-essential factor. Its truth lies in the object as my (*meinem*) object, or lies in the "meaning" (*Meinen*), in what I "mean"; it *is*, because *I* know it. Sense-certainty is thus indeed banished from the object, but it is not yet thereby done away with; it is merely forced back into the I. We have still to see what experience reveals regarding its reality in this sense.

The force of its truth thus lies now in the I, in the immediate fact of my seeing, hearing, and so on; the disappearance of the particular Now and Here that we "mean" is prevented by the fact that *I* keep hold on them. The Now is daytime, because *I* see it; the Here is a tree for a similar reason. Sense-certainty, however, goes through, in this connection, the same dialectic process as in the former case. I, *this* I, see the tree, and assert the tree to be the Here; *another* I, however, sees the house and maintains the Here is not a tree but a house. Both truths have the same authenticity — the immediacy of seeing and the certainty and assurance both have as to their specific way of knowing; but the one certainty disappears in the other.

In all this, what does not disappear is the I *qua* universal, whose seeing is neither the seeing of this tree nor of this house, but just seeing *simpliciter*, which is mediated through the negation of this house, etc., and, in being so, is all the same simple and indifferent to what is associated with it, the house, the tree, and so on. I is merely universal, like Now, Here, or This in general. No doubt I "mean" an individual I, but just something as little as I am able to say what I "mean" by Now, Here, so it is impossible in the case of the I too. By saying "this Here", "this Now", "an individual thing", I say all Thises, Heres, Nows, or Individuals. In the same way when I say "I", "this individual I", I say quite generally "all I's ", every one is "I", this individual I. When philosophy is requested, by way of putting it to a crucial test — a test which it could not possibly sustain — to "deduce", to "construe", "to find a priori", or however it is put, a so-called *this thing*, or *this particular man*, it is reasonable that the person making this demand should say *what* "this thing", or *what* "this I", he means: but to say this is quite impossible.

Sense-certainty discovers by experience, therefore, that its essential nature lies neither in the object nor in the I; and that the immediacy peculiar to it is neither an immediacy of the one nor of the other. For, in the case of both, what I "mean" is rather something non-essential; and the object and the I are universals, in which that Now and Here and I, which I "mean", do not hold out, do not exist. We arrive in this way at the result, that we have to put the *whole,* of sense-certainty as its essential reality, and no longer merely one of its moments, as happened in both cases, where first the object as against the I, and then the I, was to be its true reality. Thus it is only the whole sense-certainty itself which persists therein as immediacy, and in consequence excludes from itself all the opposition which in the foregoing had a place there.

This pure immediacy, then, has nothing more to do with the fact of otherness, with Here in the form of a tree passing into a Here that is not a tree, with Now in the sense of day-time changing into a Now that is night-time, or with there being an other I to which something else is object. Its truth stands fast as a self-identical relation making no distinction of essential and non-essential, between I and object, and into which, therefore, in general, no distinction can find its way. *I, this* I, assert, then, the Here as tree, and do not turn round so that for me Here might become not a tree, and I take no notice of the fact that another I finds the Here as not-tree, or that I myself at some other time take the Here as not-tree, the Now as not-day. I am directly conscious, I intuit and nothing more, I am pure intuition; I *am-seeing, looking*. For myself I stand by the fact, the Now is day-time, or, again, by the fact the Here is tree, and, again, do not compare Here and Now themselves with one another; I take my stand on one immediate relation: the Now is day.

Since, then, this certainty wholly refuses to come out if we direct its attention to a Now that is night or an I to whom it is night, we will go to it and let ourselves point out the Now that is asserted. We must let ourselves *point it out* for the truth of this immediate relation is the truth of *this ego* which restricts itself to *a* Now or *a* Here. Were we to examine this truth *afterwards,* or stand at a distance from it,. it would have no meaning at all; for that would do away with the immediacy, which is of its essence. We have therefore to enter the same point of time or of space, indicate them, point them out to ourselves, i.e. we must let ourselves take the place of the very same I, the very same This, which is the subject knowing with certainty. Let us, then, see how that immediate is constituted, which is *shown* to us.

The Now is pointed out; this Now. "Now"; it has already ceased to be when it is pointed out. The Now that is, is other than the one indicated, and

we see that the Now is just this — to be no longer the very time when it is. The Now as it is shown to us is one that *has been*, and that is its truth; it does not have the truth of being, of something that *is*. No doubt this is true, that it *has* been; but what has been is in point of fact not genuinely real, it is *not*, and the point in question concerned what is, concerned being.

In thus pointing out the Now we see then merely a process which takes the following course: *First* I point out the Now, and it is asserted to be the truth. I point it out, however, as something that *has been*, or as something cancelled and done away with. I thus annul and pass beyond that first truth and in the *second* place I now assert as the second truth that it *has* been, that it is superseded. But, *thirdly*, what *has* been *is not*; I then supersede, cancel, its having been, the fact of its being *annulled*, the second truth, negate thereby the negation of the Now and return in so doing to the first position: that *Now is*. The Now and pointing out the Now are thus so constituted that neither the one nor the other is an immediate simple fact, but a process with diverse moments in it. A *This* is set up; it is, however, rather an *other* that is set up; the *This* is superseded: and this otherness, this cancelling of the former, is itself again annulled, and so turned back to the first. But this first, reflected thus into itself, is not exactly the same as it was to begin with, namely something immediate: rather it is a something reflected into-self, a simple entity which remains in its otherness, what it is: a Now which is any number of Nows. And that is the Genuinely true Now; the Now is simple day-time which has many Nows within it — hours. A Now of that sort, again — an hour — is similarly many minutes; and this Now — a minute — in the same way many Nows and so on. Showing, indicating, pointing out [the Now] is thus itself the very process which expresses what the Now in truth really is: namely a result, or a plurality of Nows all taken together. And the pointing, out is the way of getting to know, of *experiencing, that Now is a universal*.

The Here pointed out, which I keep hold of, is likewise a *this* Here which, in fact, is not *this Here,* but a Before and Behind, an Above and Below, a Right and Left. The Above is itself likewise this manifold otherness — above, below, etc. The Here, which was to be pointed out, disappears in other Heres, and these disappear similarly. What is pointed out, held fast, and is permanents a negative This, which only is so when the Heres are taken as they should be, but therein cancel one another; it is a simple complex of many Heres. The Here that is “meant” would be the point. But it *is* not: rather, when it is pointed out as *being*, as having existence, that very act of pointing out proves to be not immediate knowledge, but a process, a movement from the Here “meant” through a plurality of Heres to the universal Here, which is a simple plurality of Heres, just as day is a simple plurality of Nows.

It is clear from all this that the dialectic process involved in sense-certainty is nothing else than the mere history of its process-of its experience; and sense-certainty itself is nothing else than simply this history. The naïve consciousness, too, for that reason, is of itself always coming to this result, which is the real truth in this case, and is always having experience of it: but is always forgetting it again and beginning the process all over. It is therefore astonishing when, in defiance of this experience, it is announced as “universal experience” — nay, even as a philosophical doctrine, the outcome, in fact, of scepticism — that the reality or being of external things in the sense of “Thises”, particular sense objects, has absolute validity and truth for consciousness. One who makes such an assertion really does not know what he is saying, does not know that he is stating the opposite of what he wants to say. The truth for consciousness of a “This” of sense is said to be universal experience; but the very opposite is universal experience. Every consciousness of itself cancels again, as soon as made, such a truth as e.g. the Here is a tree, or the Now is noon, and

expresses the very opposite: the Here is not a tree but a house. And similarly it straightway cancels again the assertion which here annuls the first, and which is also just such an assertion of a sensuous This. And in all sense-certainty what we find by experience is in truth merely, as we have seen, that "This" is a universal, the very opposite of what that assertion maintained to be universal experience.

We may be permitted here, in this appeal to universal experience, to anticipate with a reference to the practical sphere. In this connection we may answer those who thus insist on the truth and certainty of the reality of objects of sense, by saying that they had better be sent back to the most elementary school of wisdom, the ancient Eleusinian mysteries of Ceres and Bacchus; they have not yet learnt the inner secret of the eating of bread and the drinking of wine. For one who is initiated into these mysteries not only comes to doubt the being of things of sense, but gets into a state of despair about it altogether; and in dealing with them he partly himself brings about the nothingness of those things, partly he sees these bring about their own nothingness. Even animals are not shut off from this wisdom, but show they are deeply initiated into it. For they do not stand stock still before things of sense as if these were things *per se*, with being in themselves: they despair of this reality altogether, and in complete assurance of the nothingness of things they fall-to without more ado and eat them up. And all nature proclaims, as animals do, these open secrets, these mysteries revealed to all, which teach what the truth of things of sense is.

Those who put forward such assertions really themselves say, if we bear in mind what we remarked before, the direct opposite of what they mean: a fact which is perhaps best able to bring them to reflect on the nature of the certainty of sense-experience. They speak of the "existence" of external objects, which can be more precisely characterized as actual, absolutely particular, wholly personal, individual things, each of them not like

anything or anyone else; this is the existence which they say has absolute certainty and truty. They "mean" this bit of paper I am writing on, or rather *have* written on: but they do not say what they "mean". If they really wanted to *say* this bit of paper which they "mean", and they wanted to *say* so, that is impossible, because the This of sense, which is "meant", cannot be reached by language, which belongs to consciousness, i.e. to what is inherently universal. In the very attempt to say it, it would, therefore, crumble in their hands; those who have begun to describe it would not be able to finish doing so: they would have to hand it over to others, who would themselves in the last resort have to confess to speaking about a thing that has no being. They mean, then, doubtless this bit of paper here, which is quite different from that bit over there; but they speak of actual things, external or sensible objects, absolutely individual, real, and so on; that is, they say about them what is simply universal. Consequently what is called unspeakable is nothing else than what is untrue, irrational, something barely and simply meant.

If nothing is said of a thing except that it is an actual thing, an external object, this only makes it the most universal of all possible things, and thereby we express its likeness, its identity, with everything, rather than its difference from everything else. When I say "an individual thing", I at once state it to be really quite a universal, for everything is an individual thing: and in the same way "this thing" is everything and anything we like. More precisely, as this bit of paper, each and every paper is a "this bit of paper", and I have thus said all the while what is universal. If I want, however, to help out speech-which has the divine nature of directly turning the mere "meaning" right round about, making it into something else, and so not letting it ever come the length of words at all-by pointing out this bit of paper, then I get the experience of what is, in point of fact, the real truth of sense-certainty. I point it out as a Here, which is a Here of other Heres, or is

in itself simply many Heres together, i.e. is a universal. I take it up then, as in truth it is; and instead of knowing something immediate, I “take” something “truly”, I *per-ceive* (*wahrnehme*, per-cipio).

II. PERCEPTION: OR THINGS AND THEIR DECEPTIVENESS

Translator's comments: In this as in the preceding section apprehension is effected under conditions of sense. But whereas in the preceding type of consciousness the universality which knowledge implies and requires no sooner appeared than it melted away, here in Perception we start from a certain stability in the manner of apprehension, and a certain constancy in the content apprehended. The universality in this case satisfies more completely the demands of knowledge. The problem for further analysis is to find the form which the universal here assumes and to determine the way in which the unity of the object (the "thing") holds together its essential differences. The result shows that the unity of the thing *qua* unity is only admissible as an unqualified or non-sensuous unity. It is a universal, but as such, not conditioned by sense; it is a pure or "unconditioned" universal-a thought proper. Being undetermined by sense, it transcends sense-apprehension, and so transcends perception proper, and compels the mind to adopt another cognitive attitude in order to apprehend it. This new attitude is Understanding.

The following section is thus indirectly an analysis and a criticism of the doctrine which reduces or confines knowledge to perception. It shows that the position "esse est percipi" must give way to the principle "esse est intelligi".

Immediate certainty does not make the truth its own, for its truth is something universal, whereas certainty wants to deal with the This. Perception, on the other hand, takes what exists for it to be a universal.

Universality being its principle in general, its moments immediately distinguished within it are also universal; *I* is a universal, and the *object* is a universal. That principle has *arisen* and come into being for *us* who are tracing the course of experience; and our process of apprehending what perception is, therefore, is no longer a contingent series of acts of apprehension, as is the case with the apprehension of sense-certainty; it is a logically necessitated process. With the origination of the principle, both the moments, which as they appear merely fall apart as happenings, have at once together come into being: the one, the process of pointing out and indicating, the other the same process, but as a simple fact-the former the process of perceiving, the latter the object perceived. The object is in its essential nature the same as the process; the latter is the unfolding and distinguishing of the elements involved; the object is these same elements taken and held together as a single totality. *For us* (tracing the process) or in itself, the universal, *qua* principle, is the essence of perception; and as against this abstraction, both the moments distinguished-that which perceives and that which is perceived-are what is non-essential. But in point of fact, because both are themselves the universal, or the essence, they are both essential: but since they are related as opposites, only one can in the relation (constituting perception) be the essential moment; and the distinction of essential and non-essential has to be shared between them. The one characterized as the simple fact, the object, is the essence, quite indifferent as to whether it is perceived or not: perceiving, on the other hand, being the process, is the insubstantial, the inconstant factor, which can be as well as not be, is the non-essential moment.

This object we have now to determine more precisely, and to develop this determinate character from the result arrived at: the more detailed development does not fall in place here. Since its principle, the universal, is in its simplicity a mediated principle, the object must express this explicitly

as its own inherent nature. The object shows itself by so doing to be the *thing with many properties*. The wealth of sense-knowledge belongs to perception, not to immediate certainty, where all that wealth was merely something alongside and by the way; for it is only perception that has negation, distinction, multiplicity in its very nature.

The This, then, is established as *not* This, or as superseded, and yet not *nothing* (*simpliciter*), but a determinate nothing, a nothing with a certain content, viz. *the This*. The sense-element is in this way itself still present, but not in the form of some particular that is "meant"-as had to be the case in immediate certainty-but as a universal, as that which will have the character of the *property*. Cancelling, superseding, brings out and lays bare its true twofold meaning which we found contained in the negative: to supersede (*aufheben*) is at once to negate and to preserve. The nothing being a negation of the This, preserves immediacy and is itself sensuous, but a universal immediacy. Being, however, is a universal by its having in it mediation or negation. When it brings this explicitly out as a factor in its immediacy, it is a specifically *distinct determinate property*. As a result, there are many such properties set up at once, one the negation of the other. Since they are expressed in the simple form of the universal, these determinate characters-which, strictly speaking, become properties only by a further additional characteristic-are self-related, are indifferent to each other, each is by itself, free from the rest. The simple self-identical universality, however, is itself again distinct and detached from these determinate characteristics it has. It is pure self-relation, the "medium" wherein all these characteristics exist: in it, as in a bare, simple unity, they interpenetrate without affecting one another; for just by participating in this universality they are indifferent to each other, each by itself.

This abstract universal medium, which we can call "Thinghood" in general or pure essential reality, is nothing else than the Here and Now as

this on analysis turned out to be, viz. a simple togetherness of many Heres and Nows. But the many (in the present case) are in their determinateness themselves simply universals. This salt is a simple Here and at the same time manifold: it is white, and *also* pungent, *also* cubical in shape, *also* of a specific weight, and so on. All these many properties exist in a simple Here, where they interpenetrate each other. None of these has a different Here from the others; each is everywhere in the same Here where the others are. And at the same time, without being divided by different Heres, they do not affect each other in their interpenetration; its being white does not affect or alter the cubical shape it has, and neither affects its tart taste, and so on: on the contrary, since each is simple relation to self, it leaves the others alone and is related to these merely by being *also* along with them, a relation of mere indifference. This "Also" is thus the pure universal itself, the "medium", the "Thinghood" keeping them together.

In this relation, which has emerged, it is merely the character of positive universality that is first noticed and developed. But there is still a side presented to view which must also be taken into account. It is this. If the many determinate properties were utterly indifferent to each other, and were entirely related to themselves alone, they would not be determinate; for they are so, merely in so far as they are *distinguished* and related to others as their opposites. In view of this opposition, however, they cannot exist together in the bare and simple unity of their "medium", which unity is just as essential to them as negation. The process of distinguishing them, so far as it does not leave them indifferent, but effectually excludes, negates one from another, thus falls outside this simple "medium". And this, consequently, is not merely an "also", an unity indifferent to what is in it, but a "one" as well, an *excluding* repelling unity.

The "One" is the moment of negation, as, in a direct and simple manner, relating itself to itself, and excluding an other: and is that by which

“Thinghood” is determined *qua* Thing. In the property of a thing the negation takes the form of a specific determinateness, which is directly one with the immediacy of its being, an immediacy which, by this unity with negation, is universality. *Qua* “one”, however, negation, the specific quality, takes a form in which it is freed from this unity with the object, and exists *per se* on its own account.

These moments taken together exhaust the nature of the Thing, the truth of perception, so far as it is necessary to develop it here. It is a universality, passive and indifferent, the “also” which forms the sole bond of connection between the qualities, or rather constituent elements, “matters”, existing together; negation, likewise in a simple form, or the “one”, which consists in *excluding* properties of an opposite character; and the many properties themselves, the relation of the two first moments-the negation, as it is related to that indifferent element, and in being so expands into a manifold of differences, the focal point of particularity radiating forth into plurality within the “medium” of subsistence. Taking the aspect that these differences belong to a “medium” indifferent to what is within it, they are themselves universal, they are related merely to themselves and do not affect each other. Taking, however, the other aspect, that they belong to the negative unity, they at the same time mutually exclude one another; but do no necessarily in the shape of properties that have a separate existence apart from the “also” connecting them. The sensuous universality, the immediate unity of positive being and negative exclusion, is only then a property, when oneness and pure universality are evolved from it and distinguished from one another, and when that sensuous universality combines these with one another. Only after this relation of the unity to those pure essential moments is effected, is the “Thing” complete.

This, then, is the way the “Thing” in perception is constituted, and consciousness is perceptual in character so far as this “Thing” is its object:

it has merely to "take" the object (*capio*- per-*ception*) and assume the attitude of pure apprehension, and what comes its way in so doing is truth (*das Wahre*). If it did something when taking the given, it would by such supplementation or elimination alter the truth. Since the object is the true and universal, the self-same, while consciousness is the variable and non-essential, it may happen that consciousness apprehends the object wrongly and deceives itself. The percipient is aware of the possibility of deception; for, in the universality forming the principle here, the percipient is directly aware of otherness, but aware of it as null and naught, as what is superseded. His criterion of truth is therefore *self-sameness*, and his procedure is that of apprehending what comes before him as self-same. Since, at the same time, diversity is a fact for him, his procedure is a way of relating the diverse moments of his apprehension to one another. If, however, in this comparison a want of sameness comes out, this is not an untruth on the part of the object (for the object is the self-same), but on the part of perception.

Let us now see what sort of experience consciousness forms in the course of its actual perception. We, who are analysing the process, find this experience already contained in the development (just given) of the object and of the attitude of consciousness towards it. The experience will be merely the development of the contradictions that appear there.

The object which I apprehend presents itself as purely "one" and single: also, I am aware of the "property" (*Eigenschaft*) in it, a property which is universal, thereby transcending the particularity of the object. The first form of being, in which the objective reality has the sense of a "one", was thus not its true being; and since the *object* is the true fact here, the untruth falls on my side, and the apprehension was not correct. On account of the *universality* of the *property* (*Eigenschaft*) I must rather take the objective entity as a *community* (*Gemeinschaft*) in general. I further perceive now the

property to be determinate, opposed to another and excluding this other. Thus, in point of fact, I did not apprehend the object rightly when I defined it as a “commonness” or community with others, or as continuity; and must rather, taking account of the *determinateness* of the property, isolate parts within the continuity and set down the object as a “one” that excludes. In the disintegrated “one” I find many such properties, which do not affect one another, but are indifferent to one another. Thus I did not apprehend the object correctly when I took it for something that excludes. The object, instead, just as formerly it was merely continuity in general, is not a universal common medium where many properties in the form of sense universals subsist, each for itself and on its own account, and, *qua* determinate, excluding the others. The simple and true fact, which I perceive, is, however, in virtue of this result, not a universal medium either, but the particular property by itself, which, again, in this form, is neither a property nor a determinate being, for it is now neither attached to a distinct “one” nor in relation to others. But the particular quality is a property only when attached to a “one”, and determinate only in relation to others. By being this bare relation of self to self, it remains merely sensuous existence in general, since it no longer contains the character of negativity; and the mode of consciousness, which is now aware of a being of sense, is merely a way of “meaning” (*Meinen*) or “intending”, i.e. it has left the attitude of perception entirely and gone back into itself. But sense existence and “meaning” themselves pass over into perception: I am thrown back on the beginning, and once more dragged into the same circuit, that supersedes itself in every moment and as a whole.

Consciousness, then, has to go over this cycle again, but not in the same way as on the first occasion. For it has found out, regarding perception, that the truth and outcome of perception is its dissolution, is reflection out of and away from the truth into itself. In this way consciousness becomes

definitely aware of how its perceptual process is essentially constituted, viz. that this is not a simple bare apprehension, but in its apprehension is at the same time reflected out of the true content back into itself. This return of consciousness into itself, which is immediately involved and implicated in that pure apprehension — for this return to self has proved to be essential to perception — alters the true content. Consciousness is aware that this aspect is at the same time its own, and takes it upon itself and by so doing consciousness will thus get the true object bare and naked.

In this way we have, now, in the case of perception, as happened in the case of sensuous certainty, the aspect of consciousness being forced back upon itself; but, in the first instance, not in the sense in which this took place in the former case — i.e. not as if the truth of perception fell within it. Rather consciousness is aware that the untruth, that comes out there, falls within it. By knowing this, however, consciousness is able to cancel and supersede this untruth. It distinguishes its apprehension of the truth from the untruth of its perception, corrects this untruth, and, so far as itself takes in hand to make this correction, the truth, *qua* truth of perception, certainly falls within its own consciousness. The procedure of consciousness, which we have now to consider, is thus so constituted that it no longer merely perceives, but is also conscious of its reflection into self, and keeps this apart from the simple apprehension proper.

To begin with, then, I am aware of the “thing” as a one and have to keep it fixed in this true character as one”. If in the course of perceiving something crops up contradicting that, then I must take it to be due to my reflection. Now, in perception various different properties also turn up, which seem to be properties of the thing. But the thin is a “one”; and we are aware in ourselves that this diversity, by which the thing ceases to be a unity, falls in us. This thing, then, is, in point of fact, merely white to *our* eyes, also tart to our tongue, and also cubical to our feeling, and so on. The

entire diversity of these aspects comes not from the thing, but from us; and we find them falling apart thus from one another, because the organs they affect are quite distinct *inter se,* the eye is entirely distinct from the tongue, and so on. We are, consequently, the universal medium where such elements get dissociated, and exist each by itself. By the fact, then, that we regard the characteristic of being a universal medium as *our* reflection, *we* preserve and maintain the self-sameness and truth of the thing, its being a "one".

These diverse aspects, which consciousness puts to its side of the account, are, however, each by itself just as it appears in the universal medium, specifically determined. White is only in opposition to black, and so on, and the thing is a "one" just by the fact that it is opposed to other things. It does not, however, exclude others from itself, so far as it is "one"; for to be "one" is to be in a universal relation of self to self, and hence by the fact of its being "one" it is rather like all. It is through the determinate characteristic that the thing excludes other things. Things themselves are thus determinate in and for themselves; they have properties by which they distinguish themselves from one another. Since the property is the *special* and *peculiar* property [the *proper* property] of the thing, or a specific characteristic in the thing itself, the thing has *several* properties. For, in the first place, the thing is true being, is a being inherently in itself; and what is in it is so as its own essential nature, and not on account of other things. Hence, in the second place, the determinate properties are not on account of other things and *for* other things, but inherent in that thing itself. They are, however, determinate properties *in it* only by the fact that they are several, and maintain their distinction from one another. And, in the third self-contained, each in and for itself, and are indifferent to one another. It is, then, in truth the thing itself which is white, and *also* cubical, and *also* tart,, and so on; in other words, the *thing* is the "also", the general medium,

wherein the many properties subsist externally to one another, without touching or affecting one another, and without canceling one another; and, so taken, the thing is taken as what it truly is.

Now, on this mode of perception arising, consciousness is at the same time aware that it reflects itself also into itself, and that, in perceiving, the opposite moment to the "also" crops up. This moment, however, is the unity of the thing with itself, a unity which excludes distinction from itself. It is consequently this unity which consciousness has to take upon itself; for the thing as such is the subsistence of many different and independent properties. Thus we say of the thing, "it is white, and *also* cubical, and *also* tart", and so on. But so far as it is white it is *not* cubical, and so far as it is cubical and also white it is not tart, and so on. Putting these properties into a "one" belongs solely to consciousness, which, therefore, has to avoid letting them coincide and be *one* (i.e. one and the same property) in the thing. For that purpose it introduces the idea of "in-so-far" to meet the difficulty; and by this means it keeps the qualities apart, and preserves the thing in the sense of the "also". Quite rightly consciousness at first makes itself responsible for the "oneness" in such a way that what was called a property is represented as being "free matter" (materia libera). In this way the thing is raised to the level of a true "also" since it thus becomes a collection of component elements (materials or matters), and instead of being a "one" becomes a mere enclosure, a circumscribing surface.

If we look back on what consciousness formerly took upon itself, and now takes upon itself, what it previously ascribed to the thing, and now ascribes to it, we see that consciousness alternately makes itself, as well as the thing, into both a pure atomic many-less "one", and an "also" resolved into independent constituent elements (materials or matters). Consciousness thus finds through this comparison that not only *its* way of taking the truth contains the diverse moments of apprehension and return upon itself, but

that the truth itself, the thing, manifests itself in this twofold manner. Here we find, as a result of experience, that the thing exhibits itself, in a determinate and specific manner, to the consciousness apprehending it, but *at the same* time is reflected back into itself out of that manner of presenting itself to consciousness; in other words, the thing contains within it opposite aspects of truth, a truth whose elements are in antithesis to one another.

Consciousness, then, gets away also from this second form of perceptual procedure, that, namely, which takes the thing as the true selfsame, and itself as the reverse, as the factor that leaves sameness behind and goes back into self. Its object is now the entire process which was previously shared between the object and consciousness. The thing is a "one", reflected into self; it is *for* itself; but it is also for an other; and, further, it is an other for itself *as* it is for another. The thing is, hence, for itself and also for another, a being that has difference of a twofold kind. But it is also "one". Its being "one", however, contradicts the diversity it has. Consciousness would, consequently, have again to make itself answerable for putting the diversity into the "one", and would have to keep this apart from the thing. It would thus be compelled to say that the thing "in-so-far as" it is for itself is not for another. But the oneness belongs to the thing itself, too, as consciousness has found out; the thing is essentially reflected into self The "also", the distinction of elements indifferent to one another, falls doubtless within the thing as well as the "oneness", but since both are different, they do not fall within the same thing, but in different things. The contradiction which is found in the case of the objective content as a whole is assigned to and shared by two objects. The thing is, thus, doubtless as it stands (*an und für sich*) selfsame, but this unity with itself is disturbed by other things. In this way the unity of the thing is preserved, and, at the same time, the otherness is preserved outside the thing, as well as outside consciousness.

Now, although the contradiction in the object is in this way allotted to different things, yet the isolated individual thing will still be affected with distinction. The different things have a subsistence on their own account (*für sich*); and the conflict between them takes place on both sides in such a way that each is not different from itself, but only from the other. Each, however, is thereby characterized as a something distinctive, and contains *in it* essential distinction from the others; but at the same time not in such a way that this is an opposition within *its* being; on the contrary, it is by itself a simple determinate characteristic which constitutes its essential character, distinguishing it from others. As a matter of fact, since the diversity lies in it, this diversity does indeed necessarily assume the form of a *real* distinction of manifold qualities within it. But because the determinate characteristic gives the essence of the thing, by which it is distinguished from others, and has a being all its own, this further manifold constitution is something indifferent. The thing thus no doubt contains in its unity the qualifying "in-so-far" in two ways, which have, however, unequal significance; and by that qualification this oppositeness becomes not a real opposition on the part of the thing itself, but-so far as the thing comes into a condition of opposition through its absolute distinction — this opposition belongs to the thing with reference to an other thing lying outside it. The further manifoldness is doubtless necessarily in the thing too, and cannot be left out; but it is unessential to the thing.

This determinate characteristic, which constitutes the essential character of the thing and distinguishes it from all others, is now so defined that thereby the thing, stands in opposition to others, but must therein preserve itself for itself (*für sich*). It is, however, a thing, a self-existent "one", only so far as it does not stand in relation to others. For in this relation, the connection with another is rather the point emphasized, and connection with another means giving up self-existence, means ceasing to have a being on

its own account. It is precisely through the absolute character and its opposition that the thing relates itself to others, and is essentially this process of relation, and only this. The relation, however, is the negation of its independence, and the thing collapses through its own essential property.

The necessity of the experience which consciousness has to go through in finding that the thing is destroyed just by the very characteristic which constitutes its essential nature and its distinctive existence on its own account, may, as regards the bare principle it implies, be shortly stated thus. The thing is set up as having a being of its own, as existing for itself, or as an absolute negation of all otherness; hence it is absolute negation merely relating itself to itself. But this kind of negation is the cancelling and superseding of *itself,* or means that it has its essential reality in an other.

In point of fact the determination of the object, as it (the object) has turned out, contains nothing else. It aims at having an essential property, constituting its bare existence for itself, but with this bare self-existence it means also to embrace and contain diversity, which is to be necessary, but is at the same time not to constitute its essential characteristic. But this is a distinction that only exists in words; the nonessential, which has all the same to be *necessary,* cancels its own meaning, or is what we have just called the negation of itself.

With this the last qualifying “in-so-far”, which separated self-existence and existence for another, drops away altogether. The object is really in one and the same respect the opposite of itself-for itself “so far as” it is for another, and for another “so far as” it is for itself. It is for itself, reflected into self, one; but all this is asserted along with its opposite, with its being for another, and for that reason is asserted merely to be superseded. In other words, this existence for itself is as much unessential as that which alone was meant to be unessential, viz. the relation to another.

By this process the object in its pure characteristics, in those features which were to constitute its essential nature, is superseded, just as the object in its sensible mode of existence became transcended. From being sensible it passed into being a universal; but this universal, because derived from sense, is essentially conditioned by it, and hence is, in general, not a genuine self-identical universality, but one affected with an opposition. For that reason this universality breaks up into the extremes of singleness and universality, of the one of the properties and the "also" of the free constituents or matters". These pure determinations appear to express the essential nature itself; but they are merely a self-existence which is fettered at the same time with existence for an other. Since, however, both essentially exist in a single unity, we have before us now *unconditioned absolute universality*; and it is here that consciousness first truly passes into the sphere of *Understanding*, of Intelligence.

Sensible singleness thus disappears in the dialectic process of immediate certainty, and becomes universality, but merely sensuous universality. The stage of "meaning" has vanished, and perceiving takes the object as it inherently is in itself, or, put generally, as a universal. Singleness, therefore, makes its appearance there as true singleness, as the inherent nature of the "one", or as reflectedness into self. This is still, however, a conditioned self-existence alongside which appears another self-existence, the universality opposed to singleness and conditioned by it. But these two contradictory extremes are not merely alongside one another, but within one unity; or, what is the same thing, the common element of both, self-existence, is entirely fettered to its opposite, i.e. is, at the same time, *not* an existence-for-self. The sophistry of perception seeks to save these moments from their contradiction, tries to keep them fixed by distinguishing between "aspects", by using terms like "also" and "so far as", and seeks in like manner to lay hold on the truth by distinguishing the unessential element from an essential

nature opposed thereto. But these expedients, instead of keeping away deception from the process of apprehension, prove rather to be of no avail at all; and the real truth, which should be got at through the logic of the perceptual process, proves to be in one and the same "aspect" the opposite (of what those expedients imply), and consequently to have as its essential content undifferentiated and indeterminate universality.

These empty abstractions of "singleness" and antithetic "universality", as also of "essence", that is attended with a "non-essential" element, an element which is all the same "necessary", are powers the interplay of which constitutes perceptual understanding, often called "sound common sense" (*Menschenverstand*). This "healthy common sense", which takes itself to be the solid substantial type of conscious life, is, in its process of perception, merely the sport of these abstractions; it is always poorest where it means to be richest. In that it is tossed about by these unreal entities, bandied from one to the other, and by its sophistry endeavors to affirm and bold fast alternately now one, then the exact opposite, it sets itself against the truth, and imagines philosophy has merely to do with "things of the intellect" (*Gedankendinge*), merely manipulates "ideas". As a matter of fact, philosophy does have to do with them, too, and knows them to be the pure essential entities, the, absolute powers and ultimate elements. But in doing so, philosophy knows them at the same time in their determinate and specific constitution, and is, therefore, master over them; while that perceptual understanding takes them for the real truth, and is led by them from one mistake to another. It does not get the length of being, aware that there are such simple essentialities operating within it and dominating its activity; it thinks it has always to do with quite solid material and content; just as sense-certainty is unaware that its essence is the empty abstraction of pure being. But in point of fact it is these essential elements in virtue of which perceptual understanding makes its way hither and thither through

every kind of material and content; they are its principle of coherence and control over its varied material; they alone are what constitutes for consciousness the essence of sensuous things, what determines their relations to consciousness; and they are that in the medium of which the process of perceiving, with the truth it contains, runs its course. The course of this process, a perpetual alternate determining of the truth and superseding of this determination, constitutes, properly speaking, the constant everyday life and activity of perceptual intelligence, of the consciousness that thinks it lives and moves in the truth. In that process it advances, without halt or stay, till the final result is reached, when these essential ultimate elements or determinations are all alike superseded; but in each particular moment it is merely conscious of one given characteristic as the truth, and then, again, of the opposite. It no doubt suspects their unessentiality; and, to save them from the impending danger, it takes to the sophistry of now asserting to be true what it had itself just affirmed to be not true. What the nature of these untrue entities really wants to force this understanding to do — viz. to bring together and thereby cancel and transcend the ideas about that "universality" and "singleness", about that "'essentiality" which is necessarily connected with an "unessentiality" and about an "unessential" that is yet "necessary" — understanding " strives to resist by leaning for support on the so qualifying terms "in-so-far", "a difference of aspect", or by making *itself* answerable for one idea in order to keep the other separate and preserve it as the true one. But the very nature of these abstractions brings them together as they are and of their own accord. "Sound common sense" is the prey of these abstractions; they carry understanding round in their whirling circle. When understanding tries to give them truth by at one time taking their untruth upon itself, while at another it calls their deceptiveness a mere appearance due to the uncertainty and unreliability of things, and separates the essential from an element

which is necessary to them, and yet is to be unessential, holding the former to be their truth as against the latter: — when understanding takes this line, it does not secure them *their* truth, but convicts *itself* of untruth.

III. FORCE AND THE UNDERSTANDING-THE WORLD OF APPEARANCE AND THE SUPERSENSIBLE WORLD

TRANSLATOR'S COMMENTS: THE term "force" holds primarily with reference to the realm of Nature, whether physical or vital: but it is also used, more or less analogically, in reference to other spheres, e.g. morality. It is the objective counterpart of the activity of "understanding"; it is objectively the same kind of relation of unity to differences which is subjectively realized when the mind understands. Force is a self-conditioned principle of unity; the differences are the "expressions of force", the unity evolves the differences out of itself. Understanding similarly is a self-conditioned process; it consists in reducing differences to some ultimate unity, which is capable of deriving or "explaining" those differences from itself. The "unconditioned universal" to which we are led by the analysis of perception takes shape, therefore, as "force". The question is, How are the elements of this unconditioned universal related, and how do they hold together? The answer is found in the highest achievement of the operation of understanding-the establishment of a "kingdom of laws", which in its entirety is the meaning of the world so far as understanding goes. But laws *per se* are looked on as an inner realm, which merely "appears" in the detailed particulars which those laws control, and in which those laws are made manifest. The differences, in fact, are "phenomena", the laws *per se* are behind the scenes: — the world as a whole thus becomes distinguished into a realm of phenomena and a realm of noumena. These two realms set a new problem to the mind, and must again be brought together in a completer way than understanding can do. This new state of consciousness is "self-consciousness".

In this section we have at once an analysis of empiricism and a Criticism of the Kantian solution of the problem of empiricism. It is shown that if phenomena are appearances of noumena, then the noumena do appear, and are, in fact, nothing except so far as they appear: otherwise the noumena, so far being "hidden", are worse than appearances, they are illusion. The phenomena are not merely appearances "to the mind", but appearances of something that does make itself manifest. If phenomena are thus not external to and still less independent of noumena, noumena are just as truly immanent in phenomena. Treated in any other way, noumena can at best be only another kind of phenomena; and this raises anew precisely the problem which the opposition of phenomena or noumena was intended to solve. Phenomena are related to noumena as the trees to the wood, not as a compound to its atoms. The solution of the difficulty is thus only to be found in the type of consciousness which contains both — and this, Hegel says, is self-consciousness.

Consciousness has found "seeing" and "hearing", etc., pass away in the dialectic process of sense-experience, and has, at the stage of perception, arrived at thoughts which, however, it brings together in the first instance in the unconditioned universal. This unconditioned element, again, if it were taken as inert essence bare and simple, would itself be nothing else than the one-sided extreme of self-existence (*Fürsichseyn*);for the non-essential would then stand over against it. But if thus related to the latter, it would be itself unessential, and consciousness would not have got disentangled from the deceptions of perception; whereas this universal has proved to be one which has passed out of such conditioned separate existence and returned into itself.

This unconditioned universal, which henceforward is the true object of consciousness, is still *object* of consciousness; consciousness has not yet

grasped its principle, or notion, *qua* notion. There is an essential distinction between the two which must be drawn. On the one hand, consciousness is aware that the object has passed from its relation to an other back into itself, and thereby become inherently and implicitly (*an sich*) notion; but, on the other hand, consciousness is not yet the notion explicitly or *for* itself, and consequently it does not know itself in that reflected object. We (who are analysing experience) found this object arise through the process of consciousness in such a way that consciousness is implicated and involved in the development of the object, and the reflection is the same on both sides, i.e. there is only one reflection. But because in this movement consciousness had as its content merely the objective entity, and not consciousness as such, the result has to be given an objective significance *for consciousness;* consciousness, however, still withdrawing from what has arisen, so that the latter in objective form is the essential reality to consciousness.

Understanding has, indeed, *eo ipso,* done away with its own untruth and the untruth in its object. What has thereby come to view is the notion of the truth as implicit inherent truth, which is not yet notion, or lacks a consciously explicit existence for itself (*Fürsichseyn*), and is something which understanding allows to have its way without knowing itself in it. It pursues its own nature by itself, so that consciousness has no share in its process of free realization, but merely looks on and apprehends that realization as a naked fact. It is, consequently, *our* business in the first instance to step into its place and *be* the notion, which works up into shape what is contained in the result. With this complete formation of the object, which is presented to consciousness as a bare existent fact (*ein Seyendes*), mere implicit awareness then first becomes to itself conceptual consciousness, conscious comprehension.

The result arrived at was the unconditioned universal, in the first instance in the negative and abstract sense that consciousness negated its one-sided notions and abstracted them: it surrendered them. This result, however, has inherently a positive significance; it has established the unity of existence-for-self, and existence-for-another; in other words, absolute opposites are immediately posited as one and the same reality. At first this seems to affect merely the formal relation of the moments to one another. But to be for-self and to be for-another constitutes the content itself as well, because the opposition, looked at truly, can have no other nature than what has come about in the result — viz. that the content, taken in perception for truth, belongs, in point of fact, solely to the form, and is dissipated into its unity. This content is at the same time universal; there can be no other content which by its peculiar constitution would refuse to return into this unconditioned universality. Such a content would be some specific way or other of being for-itself and taking up a relation to something else. But to be in general for-self and to stand in relation to something else constitutes the very nature and meaning of that whose truth lies in being unconditionally universal; and the result is through and through universal.

Since, however, this unconditioned universal is ail object for consciousness, the distinction of form and content makes its appearance within it: and, in the shape of content, the moments have the aspect in which they were first presented — that of being on one side a universal medium of many substantial elements, and, on the other, a unit reflected into self, where their substantial independence is overthrown and done away with. The former dissolves the independence of the thing, is the condition of passivity which consists in being something for something else; the latter is its individual subsistence, its being something on its own account (*für sich*). We have to see what shape these moments take in the unconditioned universal which is their essential nature. It is obvious at the

outset that by existing only in this universal they do not at all lie any longer apart from one another, but rather are in themselves essentially self-cancelling aspects, and what is established is only their transition into one another.

One moment, then, appears as universal medium, or as the subsistence of independent constituents, as the reality that has stepped aside. The independence of these constituent elements, however, is nothing else than this medium; i.e. this universal is simply and entirely the plurality of such diverse universals. That the universal is *per se* in undivided unity with this plurality means, however, that these elements are each where the other is; they mutually permeate one another — without touching one another, because, conversely, the manifold diversity is equally independent. Along with that, too, goes the fact that they are absolutely pervious and porous, or are cancelled and superseded. To be thus superseded, again, or the reduction of this diversity to bare and simple self-existence, is nothing else than the medium itself, and this is the independence of the different elements. In other words, the elements set up as independent pass directly over into their unity, and their unity directly into its explicit diversity, and the latter back once again into the reduction to unity. This process is what is called *Force*. One of its moments, where force takes the form of a dispersion of the independent elements each with a being of its own, is the *Expression* of Force; when, however, force takes the form of that wherein they disappear and vanish, it is *Force proper,* force withdrawn from expressing itself and driven back into itself. But in the first place force driven back into itself *must* express itself; and, secondly, in that expression it is still force existing within itself, as much as in thus being within itself it is expression.

When we thus keep both moments in this immediate unity, it is Understanding, to which the conception of force belongs, that is, properly speaking, the principle which carries the different moments *qua* different.

For *per se* they are not to be different; the distinction consequently exists only in thought. Stated otherwise, only the mere conception of force has been put forward in the above, not its realization. In point of fact, however, force is the unconditioned universal, which is in itself just what it is for something else, or which holds difference within itself — for difference is nothing else than existence-for-an-other. Hence for force to be what it truly is, it has to be completely set free from thought, and put forward as the substantial reality of these differences, that is, first the substance *qua* the entire force remaining essentially self-contained (*an und für sich*), and then its differences as substantial entities, or as moments subsisting each on its own account. Force as such, force as driven back within itself, is in this way by itself an excluding unit, for which the unfolding of the elements or differences is another thing subsisting separately; and thus there are set up two sides, distinct and independent. But force is also the whole, or it remains what, in its very conception, it is; that is to say, these differences remain mere forms, superficial vanishing "moments". The differences between force proper, withdrawn into itself, and force unfolded and expressed in independent constituent elements, would at the same time have no being at all if they had no subsistence; i.e., force would have no being if it did not really exist in these opposite ways. But to exist in this way as opposite aspects means nothing else than that both moments are themselves at the same time independent. It is this process we, have now to deal with — the process by which both moments get themselves fixed as independent and then cancel their independence again.

Looked at broadly, it is manifest that this process nothing else than the process of perceiving, where the aspects, both percipient and content perceived, are at once inseparably united as regards the process of grasping the truth, and yet, by that very fact, each aspect is at the same time reflected into itself, is something on its own account. In the present case these two

aspects are elements or moments of force; they subsist within one unity, just as much as this unity, which appears as the middle term for the distinct and independent extremes, always gets broken up into these very extremes, which only are through this taking place. Thus the process, which formerly took the shape of the self-negation of contradictory *conceptions*, here assumes *objective* form, and is a movement of force, the result of which is to bring out the “unconditioned universal”, as something which is not objective — which is the *inner* (unperceived) being of things.

Force, as thus determined, since it is taken *as* force, or as reflected into itself, is the one side of its notion and meaning,: but a substantiated extreme, and, moreover, the extreme established with the specific character of oneness. In virtue of this, the subsistence of the differentiated elements falls outside it, and is something other than it. Since of necessity *it* has, to *be* this subsistence, i.e., to *express,* externalize itself, its expression takes the form that the other approaches it and incites it. But, in point of fact, since it must necessarily express itself, it has within itself this other, which to begin with took up a position as something outside it. We must withdraw from the position which sets up force as a one, and its essence — self-expressions — an other approaching it from outside. Force is rather itself this universal medium for the subsistence of the moments as differentiated elements; or, in other words, it *has* expressed or externalized itself, and what was to be something outside it attracting or inciting it is really force itself. It thus exists now as the medium of the differentiated elements which are evolved. But all the same it is in its very nature one and single, and has essentially the form of being that in which these subsisting elements are superseded. This oneness is in consequence now something *other* than, external to, force, since force takes its place as the medium for the elements to exist in; and force therefore has this its essential being outside itself. Since, however, it must of necessity be this essential nature, which as yet it is not affirmed to

be, this other comes forward soliciting or inciting it to reflect into self, to turn this pseudo-external factor into an aspect of itself; in other words, this other cancels its external expression. In point of fact, however, it is force itself that is thus reflected into self, that is the sublation of the external expression. The oneness vanishes as it appeared, viz. as something external; force is that very other, is force thrust back into itself.

What took the character of an external other, and incited force at once to expression and to return into self, turns out directly to be itself force: for the other shows itself to be universal medium as well as one and single, and shows this in such a way that each of the forms assumed appears at the same time to be merely a vanishing moment. Consequently force, in that there is an other for it, and it is for an other, has as a whole not yet developed its complete meaning. There are two forces present at the same time; the notion of both is no doubt the same notion, but it has passed out of its unity into duality. Instead of the opposition continuing to be entirely and essentially a mere moment, it appears to have escaped from the control of the unity and to have become, owing to this diremption, two quite independent forces. We have now to see more precisely what sort of situation this independence. introduces.

To begin with, the second force stands towards the force incited in the character of inciting force, and, moreover, with respect to its content, plays the part of universal medium. But since that second force consists essentially in an alternation of these two moments and is itself force, it is likewise, in point of fact, universal medium only then when it is incited or solicited to being so; and in the same way, too, it is negative unity, or incites and leads to the retraction of force, only by being incited thereto. As a result, this distinction, which took place between one force regarded as inciting and the other as incited, turns also into one and the same reciprocal interchange of characteristics.

The interplay of the two forces in this way arises from and consists in the two being thus determined with opposite characteristics, in their being for one another in virtue of this determination and in the complete and exchange of their characteristics — a transition direct from one to the other, whereby alone these determinations, in which the forces seem to appear independently, have being. For example, the inciting force is set up as universal medium, and, on the other hand, the force incited as a force repressed. But the former is universal medium just by the very fact of the latter being repressed: that is to say, this latter is really what incites the former, and makes it the medium it claims to be. The former gets the character it has only through the other, and is an inciting force only so far as it is incited by the latter to be so. And it loses just as readily this character given to it, for this character passes, or rather has already passed, into the character of the other. The former, acting in an external way, takes the part of universal medium, but only by its having been incited by the other force to do so. This means, however, that the latter *gives* it that position, and is really *itself* essentially universal medium: it gives the inciting agency this character just because this other character is essentially its own, i.e. because it is really its own self.

To complete our insight into the principle of this process, we may notice, further, that the distinctions themselves reveal distinction in a twofold manner. They are, on the one hand, distinctions of content, since one extreme is force reflected into itself, while the other is a medium for the constituent elements involved: on the other hand, they appear as distinctions of form, since one incites and the other is incited, the former being active, the latter passive. As regards the distinction of content, they are in fact distinct, or distinct for *us* [who are analysing the process]; as regards distinction of form, however, they are independent, in their relation parting asunder of themselves, and standing opposed. In the perception of the

movement of force, consciousness becomes aware that the extremes, in both these aspects, are nothing *per se,* that rather these sides, in which their distinction of nature was meant to consist, are merely vanishing moments, an immediate transition of each into its opposite. For us, however [who are analysing the process], it was also true, as stated above, that *per se* the distinctions, *qua* distinctions of content and form, vanished: and on the side of form, the active, inciting, or independent factor was in its very nature the same as what, from the side of content, was presented as repressed force, force driven back into itself; the passive, incited, or related factor was, from the side of form, the same as what, from the side of content, took shape as universal medium for the many constituent elements.

From this we see that the notion of force becomes actual when resolved into two forces, and we see too how it, comes to be so. These two forces exist as independent entities: but their existence lies in a movement each towards each, of such a kind that in order to be, each has in reality to get its position purely through the other; that is to say, their being has purely the significance of disappearance. They are not like extremes that keep to themselves something positively fixed, and merely transmit an external property to one another through their common medium and by external contact: they are what they are solely in this medium and in their contact with each other. We have there immediately both force as it is independently, force repressed within itself, and also its expression, force inciting and force being incited. These moments are thus not allotted to two independent extremes, offering each other only an opposite pole: rather their true nature consists simply in each being solely through the other, and in each ceasing *eo ipso* to be what it thus is through the other; since it is the other. They have thus, in point of fact, no substances of their own which could support and maintain them. The notion of force rather maintains itself as the essence in its very actuality: force when actual exists wholly and only

in its expression; and this, at the same time, is nothing else than a process of cancelling itself. This actual force, when represented as detached from its expression and existing by itself, is force driven back into itself; but this feature is itself, in point of fact, as appears from the foregoing, merely a moment in the *expression* of force. The true nature of force thus remains merely the thought or idea of force; the moments in its realization, its substantial independence and its process, rush, without let or hindrance, together into one single undivided unity, a unity which is not force withdrawn into itself (for this is merely one of those moments), but is its notion *qua* notion. The realization of force is, then, at the same time dissipation or loss of reality; it has thereby become something quite different, viz. this universality, which understanding knows from the start or immediately to be its essential nature, and which shows itself, too, to be the essence of it in what is supposed to be its reality, in the actual substances.

So far as we look on the first universal as the notion of understanding, where force does not yet exist for itself, the second is now its essential reality, as it is revealed in and for itself. Or, conversely, if we look on the first universal as the immediate, which should be an actual object for consciousness, then this second has the characteristic of being the negative of sensuously objective force: it is force, in the form in which, in its true being, force exists merely as object for understanding. The first would be force withdrawn into itself, i.e., force as substance; the second, however, is the inner being of things *qua* inner, which is one and the same with the notion *qua* notion.

This true being of things has here the characteristic that it does not exist immediately for consciousness; rather, consciousness takes up a mediated relation to the inner; in the form of understanding it looks through the intervening play of forces into the real and true background of things. The middle term combining the two extremes, understanding and the inner of

things, is the explicitly evolved being of force, which is now and henceforth a vanishing process for understanding itself. Hence it is called Appearance (*Erscheinung*); for being which is *per se* straightway non-being we call a show, a semblance (Schein). It is, however, not merely a show, but appearance, a totality of seeming (*Schein*). This totality as totality or universal is what makes up the inner world, the play of forces in the sense of its reflection into itself. There consciousness has before itself in objective form the things of perception as they truly are, i.e. as moments turning, without halt or separate subsistence, directly into their opposite, the "one" changing immediately into the universal, the essential becoming at once something unessential, and vice versa. This play of forces is consequently the development of the negative; but its true nature is the positive element, viz. the universal, the implicit object, the object existing *per se.*

The being of this object for consciousness is mediated through the movement of appearance, by which the content of perception and the sensuous objective world as a whole, get merely negative significance. There consciousness is turned back upon itself as the truth; but, being consciousness, it again makes this truth into an inner being of the object, and distinguishes this reflection of things from its own reflection into self: just as the mediating process likewise is for it still an objective process. This inner nature is therefore for it an extreme placed over against it. But it is on that account the truth for it, because therein, as in something essentially real, it possesses at the same time the certainty of its own self, the moment of its own self-existence. But it is not yet conscious of this basis [its self-existence], for the independence, its being on its own account, which should have the inner world within it, would be nothing else than the negative process. This negative process, however, is for consciousness still objective vanishing appearance, and not yet its own proper self-existence

(*Fürsichseyn*). Hence the, inner is no doubt taken to be notion., but consciousness does yet know the nature of the notion.

Within this inner truth, this absolute universal which has got rid of the opposition between universal and particular, and become the object of understanding, is a supersensible world which henceforth opens up as the true world, lying beyond the sensuous world which is the world of appearance. Away remote from the changing vanishing present (*Diesseits*) lies the permanent beyond (*Jenseits*): an immanent inherent reality (*ein Ansich*), which is the first and therefore imperfect manifestation of *Reason,* i.e. it is merely the pure element where the truth finds its abode and its essential being.

Our object henceforward has thus the form of a syllogistic inference (*Schluss*), whose extremes are the inner being of things and understanding, and its middle term the sphere of appearance. The course of this inferential process, however, furnishes the further characterization of what understanding detects in the. inner world by the aid of the middle term; and gives rise to the experience understanding goes through regarding this relation of the terms when joined and united together.

The inner world is so far for consciousness a bare and simple beyond, because consciousness does not as yet find itself in it. It is empty, for it is the nothingness of appearance, and positively the naked universal. This type of inwardness suits those who say that the inner being of things cannot be known; but the reason for the position would have to be taken in some other sense. Certainly there is no knowledge to be had of this inner world, as we have it here; not, however, owing to reason being too short-sighted, or limited, or whatever you care to call it (on this point there is as yet nothing known at this stage; we have not gone deep enough for that yet), but on account simply of the nature of the case, because in the void there is

nothing known, or, putting it from the point of view of the other side, because its very characteristic lies in being *beyond* consciousness.

The result is, of course, the same if you place a blind man amid the wealth of the supersensible world (if it has a wealth, whether this be a content peculiarly its own, or whether consciousness itself be this content), and if you place one with sight in absolute darkness, or, if you like, in pure light, supposing the supersensible world to be this. The seeing man sees in that pure light as little as in absolute darkness, and just as much as the blind man in the ample wealth which lay before him. If there were nothing more to be done with the inner sphere and with our being bound up along with it by means of the world of appearance, then there would be nothing left but to stop at the phenomenal world, i.e. take something for truth about which we know that it is not true. Or in order that there may be something in this empty void — which, while it originally came about as a state devoid of *objective,* things, has, however, since it is emptiness pure and simple, to be taken to be also devoid of all *mental* relations and distinctions of consciousness *qua* consciousness — in order that in this complete vacuity, which is even called the holy of holies, the inner sanctuary, there may yet be *something*, we should be driven to fill it up with dreamings, *appearances*, produced by consciousness itself. It would have to be content with being treated so badly, for it would not deserve anything better, since even dreams are something better than its own barren emptiness.

The inner world, or the supersensible beyond, has, however, *arisen*: it comes to us out of the sphere of appearance, and the latter is its mediating agency: in other words, appearance is its essential nature and, in point of fact, its filling. The supersensible is the established truth of the sensible and perceptual. The truth of the sensible and the perceptual lies, however, in being appearance. The supersensible is then *appearance qua appearance*. We distort the proper meaning of this, if we take it to mean that the

supersensible is therefore the sensible world, or the world as it is for immediate sense-certainty, and perception. For, on the contrary, appearance is just not the world of sense-knowledge and perception as positively being, but this world as superseded or established in truth as an inner world. It is often said that the supersensible is not appearance; but by appearance is thereby meant not appearance, but rather the sensible world taken as itself real actuality.

Understanding, which is our object here, finds itself in this position, that, for it, the inner world has come about to begin with, only as the implicit inherent being, universal and still without a filling. The play of forces has simply and solely this negative significance of not being something *per se;* and its only positive significance is that of being the mediating agency, but outside understanding. The relation of understanding to the inner world through mediation is, however, its own process, by which the inner world will be found to receive fullness of content.

The play of forces is what understanding has directly to do with; but the real truth for it is the inner world bare and simple. The movement of force is consequently the truth only by being in like manner something simple. Regarding this play of forces, however, we saw that its peculiarity lay in this, that the force which is awakened into activity by another force is just on that account the inciting agency for this other force, which thereby itself only then becomes an inciting force. We have here in this way merely direct and immediate interchange or complete exchange of the characteristic which constitutes the sole content of what comes before us, viz. the fact of being either universal medium or negative unity. It ceases immediately on its entrance in determinate form to be what it was on entering: it awakens or incites, by its appearance in determinate shape, the other side, which thereby gives itself expression, i.e. the latter is now directly what the first was to be. Each of these two sides, the relation of inciting and the relation

of the opposed determinate content, is on its own account an absolute process of permutation and transposition. But these two relations are again themselves one and the same, and the formal distinction of being incited and of inciting to activity is the same as the distinction of content, i.e. the distinction between the incited factor as such, viz. the passive medium, on the one side, and the inciting factor, viz. the active medium, the negative unity, or the "one" on the other side. In this way there disappears all distinction of contrasted and opposed particular forces, which were meant to be present in this process; for they rested solely on the above distinctions. And, along with both those distinctions, the distinction between the forces collapses likewise into merely one. There is thus neither force nor inciting and being incited to action, nor the characteristic of being a stable medium and a unity reflected into self, there is neither a particular which is something on its own account, nor are there diverse opposites. What is found in this flux of thoroughgoing change is merely difference as universal difference, or difference into which the various opposites have been resolved. This difference as universal, consequently is what constitutes the ultimate simple element in that play of forces, and is the resultant truth of that process. It is the *Law* of Force.

The absolute flux of the world of appearance passes into bare and simple difference through its relation to the simplicity of the inner being, the simplicity apprehended by understanding. The inner being is in the first instance merely the implicit universal. This implicit simple universal, however, is essentially absolute universal difference as well; for it is the outcome of the change itself, or change is its very nature. But change, when planted in the inner reality as it [change] truly is, forthwith is taken up into that reality as equally absolute universal difference at peace with itself, and remaining at one with itself. In other words, negation is an essential moment of the universal; and negation or mediation in what is universal is

universal difference. This difference is expressed in the law, which is the stable presentment or picture of unstable appearance. The supersensible world is in this way a quiescent “kingdom of laws”, no doubt beyond the world of perception-for this exhibits the law only through incessant change — but likewise present in it, and its direct immovable copy or image.

This kingdom of laws is indeed the truth for understanding; and that truth finds its content in the distinction which lies in the law. At the same time, however, this kingdom of laws is only the preliminary truth and does not give all the fullness of the world of appearance. The law is present therein, but is not all the appearance present; under ever-varying circumstances the law has an ever-varying actual existence. Thereby appearance continues to keep one aspect which is not in the inner world; i.e. appearance is not yet in very truth established as *appearance*, as that whose independent being has been done away with. This defect in the law has to be brought out in the law itself. What seems defective in it is that while it no doubt has difference within it, it contains this in a merely universal indeterminate way. So far, however, as it is not *law* in general, but *a* law, it has determinateness within it; and as a result there are found an indeterminate plurality of laws. But this plurality is rather itself a defect; it contradicts the principle of understanding, for which, since it is consciousness of the simple inner being, truth is the inherently universal *unity*. It must, therefore, let the many laws coalesce into a single law, just as, e.g., the law by which a stone falls, and that by which the heavenly bodies move have been conceived as one law. When the laws thus coincide, however, they lose their specific character. The law becomes more and more abstract and superficial, and in consequence we find as a fact, not the unity of these various determinate laws, but a law which leaves out their specific character; just as the one law, which combines in itself the laws of falling terrestrial bodies, and of the movements of celestial bodies, does not,

in point of fact, express both kinds of laws. The unification of all laws in universal attraction expresses no further content than just the bare concept of the law itself, a concept which is therein set down as existing. Universal attraction says merely that everything has a constant distinction for anything else. Understanding pretends by that to have found a universal law which gives expression to universal reality as such; but, in point of fact, it has merely found the conception of law itself, although in such a way that it at the same time thereby declares all reality to be in its very nature conformed to law. The idea of universal attraction has, therefore, to this extent great importance, that it is directed against that unthinking way of representing reality, to which everything appears in the shape of accident and chance, and for which determinateness, specificity, takes the form of sensuous independence.

In contrast, then, with determinate laws stands universal attraction, or the bare conception of law. In so far as this pure conception is looked on as the essentially real, or as the true inner being, the determinateness characterizing the specific law itself belongs still to the sphere of appearance, or rather to sensible existence. But the pure conception of law transcends not merely the law, which, being itself a determinate law, stands contrasted with other determinate laws, but also transcends law as such. The determinateness, of which we spoke, is itself strictly a mere vanishing moment which can no longer come forward here as an essential entity (*Wesenheit*), for it is only the law which is the truth here: but the conception of law is turned against the law itself. That is to say, in the law distinction itself is immediately apprehended and taken up into the universal, thereby, however, making the moments, whose relation it expresses, subsist as mutually indifferent and inherently real entities. These parts of the distinction found in the law are, however, at the same time themselves. determinate aspects. The pure concept of law, as universal attraction, must,

to get its true significance, be so apprehended that in it, as the absolutely single and simple, the distinctions which are present in law as such, return again themselves into the inner being, qua bare and simple unity. This unity is the inner "necessity" of the law.

The law is thereby present in a twofold form. In one case it is there as law in which the differences are expressed as independent moments; in the other it is in the form of a simple withdrawal into itself, which again can be called Force, but in the sense not of repressed force [spoken of above], but force in general, or the concept of force, an abstraction which absorbs the distinctions involved in what attracts and is attracted. In this sense, e.g., simple electricity is force; the expression of difference falls, however, within the law; this difference is positive and negative electricity. In the case of the motion of falling bodies force is the simple element, gravity, which has the law that the magnitudes of the different factors in the motion, the time spent, and the space traversed, are to one another in the relation of root and square. Electricity itself is not difference *per se,* is not in its essential nature. a twofold entity consisting of positive and negative electricity; hence it is often said it *has* the law of being so and so in the way indicated, or again, that it *has* the*property* of expressing itself in this fashion. This property is doubtless the essential and peculiar property of this force, i.e. it belongs to it necessarily. But necessity is here an empty phrase; force *must*, just because it must, duplicate itself in this manner. Of course, if positive electricity is given, negative electricity is inherently necessary; for the positive element only is by being, related to a negative; in other words, the positive element in its very self involves difference from itself, just in the same way as the negative does. But that electricity as such should break itself up into parts in this way — this is not in itself a necessity. Electricity *qua* simple force is indifferent to its law — to be in the form of positive and negative; and if we call the former its notion and the latter its being, then its

notion is indifferent to its being; it merely has this as a property, which just means that this is not *per se* necessary to it. This indifference takes another form when it is said that to be positive and negative is involved in the definition of electricity, or that this is neither more nor less than its notion and its essence. Its being in that case would mean its existence in general. But in that definition the necessity of its existence is not contained; it exists either because we find it, i.e. its existence is not necessary at all, or else it exists through other forces, i.e. the necessity of its existence is an external necessity. But in that the determinateness of being through another is what the necessity consists in, we are back again to the plurality of determinate laws, which we have just left in order to consider law, as law. It is only with the latter that we can compare its notion as notion, or its necessity. This necessity, however, has in all these forms shown itself to be just an empty phrase.

There is still another way than that just indicated in which the indifference of law and force, or of notion and being, is found. In the law of motion, e.g., it is necessary for motion to be broken up into the elements time and space, or again, into distance and velocity. Since motion is merely the relation of these f actors, motion, the universal, has in this way certainly distinct parts in its own self. But now these parts, time and space, or distance and velocity, do not express in themselves this origination from a single unity. They are indifferent the one to the other. Space is thought of as able to be without. time, time without space, and distance at least without velocity — just as their magnitudes are indifferent the one to the other, since they are not related like positive and negative, and consequently do not refer to one another by their very nature. The necessity of partition into distinct factors, then, we certainly do have here; but not the necessity of the parts as such for one another. On that account, however, that first necessity too is itself a merely delusory false necessity. For motion is not itself

thought of as something simple or as bare essence, but as, from the first, divided into elements; time and space are in themselves its independent parts or its real elements: in other words, distance and velocity are modes of being, or ways of thinking, each of which can very well be without the other; and motion is consequently no more than their superficial relation, not their true nature. If it is represented as simple essence or as force, motion is no doubt gravity; but this does not contain these distinctions at all.

The distinction is, then, in both cases no distinction of an inherent or essential kind. Either the universal, force, is indifferent to the division into parts, which is found in the law, or else the distinctions, the parts of the law, are indifferent to one another. Understanding, however, does have the notion of this distinction *per se,* just by the fact that law is in part the inner being, the inherent nature, but is at the same time something distinguished within the notion. That this distinction is thereby *inner* distinction is shown by the fact that law is bare and simple force, or is the notion of that distinction, and thus is a distinction of the notion. But still this inner distinction falls to begin with only within understanding, and is not yet established in the fact itself. It is thus only its own necessity to which understanding gives expression — the distinction, that is to say, is one which it makes only so as at the same time to express that the distinction is not to be a distinction in the nature of the fact itself. This necessity, which is merely verbal, is thus a rehearsal of the moments which make up the cycle of necessity. They are no doubt distinct, but their distinction is at the same time explicitly stated to be not a distinction of the fact itself, and consequently is itself again straightway cancelled and transcended. This process is called *Explanation*. A law is expressed; from this its inherently universal element or ground is distinguished as force; but regarding this distinction, it is asserted that it is no distinction, rather that the ground has entirely the same constitution as the law. For example, the particular

occurrence of lightning is apprehended as universal, and this universal is expressed as the law of electricity; the explanation thereupon merges the law in force as the essence of the law. This force is, then, so constituted that, when it finds expression, opposite electrical discharges appear, and these again disappear into one another. In other words, force has exactly the same constitution as law; both are thus declared to be in no way distinct. The distinctions are pure universal expression or law and pure force; but both have the same content, the same constitutive character; thus the distinction between them *qua* distinction of content, i.e. of fact, is also again withdrawn.

In this tautological process understanding, as the above shows, holds fast to the changeless unity of its object, and the process takes effect solely within understanding itself, not in the object. It is an explanation that not only explains nothing, but is so plain that, while it makes as if it would say something different from what is already said, it really says nothing at all, but merely repeats the same thing over again. So far as the fact itself goes, this process gives rise to nothing new; the process is only of account as a process of understanding. In it, however, we now get acquainted with just what we missed in the case of the law — absolute change itself: for this process, when looked at more narrowly, is directly the opposite of itself. It sets up, that is. a distinction which is not only for us no distinction, but which it itself cancels as distinction. This is the same process of change which was formerly manifested as the play of forces. In the latter we found the distinction of inciting and incited force, or force expressing itself, and force withdrawn into itself; but these were distinctions which in reality were no distinctions, and therefore were also immediately cancelled again. We have here not merely the naked unity, so that no distinction could be set up at all; the process we have is rather this, that a distinction is certainly made, but because it is no distinction, it is again superseded.

Thus, then, with the process of explaining, we see the ebb and flow of change, which was formerly characteristic of the sphere of appearance, and lay outside the inner world, finding its way into the region of the supersensible itself. Our consciousness, however, has passed from the inner being as an object over to understanding on the other side, and finds the changing process there.

The change is in this way not yet a process of the fact itself, but rather presents itself before us as pure change, just by the content of the moments of change remaining the same. Since, however, the notion *qua* notion of understanding is the same as the inner nature of things, this change becomes for understanding the law of the inner world. Understanding thus learns that it is a law in the sphere of appearance for distinctions to come about which are no distinctions. In other words, it learns that what is self-same is self-repulsive, and, similarly, that the distinctions are only such as in reality are none and cancel one another, or that what is not self-same is self-attractive. Here we have a second law, whose content is the opposite of what formerly was called law, viz. the invariable and unchanging self-identical distinction; for this new law expresses rather the process of like becoming unlike, and unlike becoming like. The notion demands of the unreflective mind to bring both laws together, and become conscious of their opposition. Of course the second is also a law, an inner self-identical being; but it is rather a self-sameness of the unlike, a constancy of inconstancy. In the play of forces this law proved to be just this absolute transition and pure change; the selfsame, force, split into an opposition, that in the first instance appeared as a substantial independent distinction, which, however, in point of fact proved to be none. For it is the selfsame which repels itself from itself, and this element repelled is in consequence essentially self-attracted, for it is the same; the distinction made, since it is none, thus cancels itself again. The distinction is hence set forth as a distinction on the part of the fact itself, or

as an absolute (objective) distinction; and this distinction on the part of the fact is thus nothing but the selfsame, that which has repelled itself from itself, and consequently only set up an opposition which is none.

By means of this principle, the first supersensible world, the changeless kingdom of laws, the immediate ectype and copy of the world of perception, has turned round into its opposite. The law was in general, like its differences, self-identical; now, however, it is established that each side is, on the contrary, the opposite of itself. The self-identical repels itself from itself, and the self-discordant sets up to be selfsame. In truth only with a determination of this kind is distinction inner distinction, or immanent distinction, when the like is unlike itself, and the unlike like itself.

This second supersensible world is in this way the inverted world (*verkehrte Welt*), and, moreover, since one aspect is already present in the first supersensible world, the inverted form of this first. The inner being is, thereby, in its character of appearance completed. For the first supersensible world was only the immediate raising of the world of perception into the element of universality. It has its necessary counterpart in this world of perception, which still retains as its own the principle of change and alteration. The first kingdom of laws dispenses with this principle, but receives it in the form of an inverted world.

By the law of this inverted world, then, the selfsame in the first world is the unlike of itself, and the unlike in the first is equally unlike to itself, or it becomes like itself. Expressed in determinate moments, this will assume the form that what by the law of the first is sweet, is, in this inner, inverted reality, sour; what is there black is here white. What, by the law of the first, was north pole in the case of the magnet, is, in its other supersensible inner world (viz. in the earth), south pole; “while what was there south pole is here north pole. Similarly, what by the first law is in the case of electricity the oxygen pole becomes in its other supersensible reality hydrogen pole;

and conversely, what is there the pole of hydrogen becomes here the pole of oxygen. To take another sphere of experience: revenge on an enemy is, according to the primitive immediate law, the supreme satisfaction of injured individuality. This law, however — that of standing up against one who does not treat me as a substantial self, showing him that I am a substantial being, and even doing away with *him* as a reality — this law is transmuted by the principle of the other world into the very opposite, the reinstatement of myself as the true reality through the removal of the alien hostile being is turned into self-destruction. If now this inversion, which is brought out in the punishment of crime, is made into a law, it also is again only the law of a world which has an inverted supersensuous world standing in antithesis to itself, where that which is despised in the former comes to honour, and that which in the former is honoured meets with contempt. The punishment which, by the law of the former, disgraces a man and annihilates him, turns round in its inverted world into the pardoning grace which preserves his being and brings him to honour.

Looked at on the surface, this inverted world is the antithesis of the first in the sense that it has the latter outside itself, and repels that world from itself as an inverted reality; that the one is the sphere of appearance, while the other is the inherent being; that the one is the world as it is for an other, the other again the world as it is for itself. In this way, to use the previous examples, what tastes sweet is properly, or inwardly in the thing, sour; or what is north pole in the case of the actual magnet belonging to the sphere of appearance, would be, in the inner or essential being, south pole. What is shown to be oxygen pole in electricity as a phenomenon, would be hydrogen pole in the case of electricity not failing within the sphere of appearance. Or again, an act which in appearance is a crime would in its inner nature be capable of being really good — a bad act may have a good intention; punishment is only in appearance punishment; in itself or in

another world it might well be, for the criminal, a benefit. But such oppositions of inner and outer, appearance and supersensible, in the sense of two sorts of reality, are no longer to be found here. The differences repelled are not divided anew and assigned to two substances such as would support them and lend them a separate subsistence, the result of which would be that understanding would leave the inner region, and fall back again on its previous position. The one aspect or substance would be once more the world of perception, where the one of those two laws would carry on its existence, and in opposition to it an inner world, just such a sensible world as the first, but in the sphere of ideas; one that could not be indicated, seen, heard, and tasted as a sensible world, and yet would be thought of as such a sensible world. But in point of fact, if the one element set up is a perceived reality, and its inherent being, as its inverted form, is at the same time a sensuously represented element, then sour, which would be the inherent nature of the sweet thing, is a real thing just as much as the latter, viz., a sour thing; black, which would be the inherent nature of white, is the actual black; the north pole, which is the true reality of the south pole, is the north pole present in the same magnet; the oxygen pole, the inherent nature of the pole of hydrogen, is the given oxygen pole of the same voltaic pile. The actual crime, however. finds its inversion and its inherent nature *qua* possibility, in the intention as such, but not in a good intention; for the truth of intention is simply the deed itself. The crime, so far as its content goes, recoils upon itself, finds its inversion in actual punishment; this is the reconciliation of the law with the reality set up against it in crime. Finally, the actual punishment carries its inverted reality with it in such a way that it is a kind of realization of the law, whereby the activity, which the law exercises in the form of punishment, is cancelled in the process, a manner of realization through which the law, from being actively operative,

becomes again quiescent and authoritative, and the conflict of individuality with it, and of it with individuality, is extinguished.

From the idea, then, of inversion which constitutes the essential nature of one aspect of the supersensible world, we must dissociate the sensuous idea of keeping distinctions substantively fixed in a different element that sustains them; and this absolute notion of distinction must be set forth and apprehended purely as inner distinction, self-repulsion of the selfsame as selfsame, and likeness of the unlike as unlike. We have to think pure flux, opposition within opposition itself, or Contradiction. For in the distinction, which is an internal distinction, the opposite is not only one of two factors — if so, it would not be an opposite, but a bare existent — it is the opposite of an opposite, or the other is itself directly and immediately present within it. No doubt I put the opposite here and the other, of which it is the opposite, there; that is, I place the opposite on one side, taking it by itself without the other. Just on that account, however; since I have here the opposite all by itself, it is the opposite of its *own* self, that is, it has in point of fact the other immediately within itself. Thus the supersensible world, which is the inverted world, has at the same time reached out beyond the other world and has in itself that other; it is to itself conscious of being inverted (*für sich verkehrte*), i.e. it is the inverted form of itself; it is that world itself and its opposite in a single unity. Only thus is it distinction as internal distinction, or distinction *per se;* in other words, only thus is it in the form of *Infinity*.

By means of infinity we see law attaining the form of inherent necessity, and so realizing its complete nature; and all moments of the sphere of appearance are thereby taken up into the inner realm. That the simple and ultimate nature of law is infinity means, according to the foregoing analysis, (a) that it is a self-identical element, which, however, is inherently distinction; or that it is selfsameness which repels itself from itself, breaks asunder into two factors. What was called simple force duplicates itself, and

through its infinity is law. It means (b) that what is thus sundered, constituting as it does the parts which are thought of as in the law, puts itself forward as subsisting, as stable; and, if the parts are considered without the conception of internal distinction, then space and time, or distance and velocity, which appear as moments of gravity, are just as much indifferent and without necessary relation to one another as to gravity itself, or again as this bare gravity is indifferent to them, or as simple electricity is indifferent to positive and negative. But (c) by this conception of internal distinction, this unlike and indifferent factor, space and time, etc., becomes a distinction, which is no distinction, or merely a distinction of what is selfsame, and its essence is unity. They are reciprocally awakened into activity as positive and negative by each other, and their being lies rather in their putting themselves as not-being, and cancelling themselves in the common unity. Both the factors distinguished subsist; they are *per se,* and they are *per se* as opposites, that is are the opposites of themselves; they have their antithesis within them, and are merely *one* single unity.

This bare and simple infinity, or the absolute notion, may be called the ultimate nature of life, the soul of the world, the universal life-blood, which courses everywhere, and whose flow is neither disturbed nor checked by any obstructing distinction, but is itself every distinction that arises, as well as that into which all distinctions are dissolved; pulsating within itself, but ever motionless, shaken to its depths, but still at rest. It is self-identical, for the distinctions are tautological; they are distinctions that are none. This self-identical reality stands, therefore, in relation solely to itself. *To itself;* which means this is an other, to which the relation points; and relation to itself is, more strictly, breaking asunder; in other words, that very self-identity is internal distinction. These sundered factors have, hence, each a separate being of their own; each is an opposite-of an other; and thus with each the other is therein *ipso facto* expressly given; or it is not the opposite

of an *other*, but only the pure opposite; and thus each is, therefore, in itself the opposite of itself. Or, again, each is not an opposite at all, but exists purely for itself, a pure self-identical reality, with no distinction in it. This being so, we do not need to *ask,* still less to treat anxiety over such a question as philosophy — or even regard this as a question philosophy cannot answer— "how distinction or otherness is to come out of this pure essence, how these are to be really got out of it". For the process of disruption has already taken place; distinction has been excluded from the self-identical entity, and put on one side so far as it is concerned; what was to have been the self-identical is thus already one of the sundered elements, instead of being the absolute essential reality. That the self-identical breaks asunder means, therefore, just as truly that it supersedes itself as *already* sundered, that it cancels itself *qua* otherness. The unity which people usually have in mind when they say distinction cannot come out of unity, is, in point of fact, itself merely one moment of the process of disruption; it is the abstraction of simplicity, which stands *in contrast with* distinction. But in that it is abstraction, is merely one of the two opposed elements, the statement thus already implies that the unity is the process of breaking asunder; for if the unity is a negative element, an opposite, then it is put forward precisely as that which contains opposition within it. The different aspects of diremption and of becoming self-identical are therefore likewise merely this process of self-cancelling. For since the self-identical element, which should first divide itself asunder or pass into its opposite, is an abstraction, i.e. is *already itself* a sundered element, its diremption is *eo ipso* a cancelling of what it is, and thus the cancelling of its being sundered. The process of becoming self-identical is likewise a process of diremption; what becomes identical with itself thereby opposes itself to disruption, that is, itself thereby puts itself on one side; in other words, it becomes really something sundered.

Infinitude, this absolute unrest of pure self-movement, such that whatever is determined in any way, e.g., as being, is really the opposite of this determinateness — has from the start been no doubt the very soul of all that has gone before; but it is in the inner world that it has first come out explicitly and definitely. The world of appearance, or the play of forces, already shows its operation; but it is in the first instance as Explanation that it comes openly forward. And since it is at length an object for consciousness, and consciousness is aware of it as what it is, consciousness is in this way *Self-consciousness*. Understanding's function of explaining furnishes in the first instance merely the description of what self-consciousness is. Understanding cancels the distinctions present in Law, distinctions which have already become pure distinctions but are still indifferent, and puts them inside a single unity, Force. This identification, however, is at the same time and immediately a process of diremption; for understanding removes the distinctions and sets up the oneness of force only by the fact that it creates a new distinction of force and law, which at the same time, however, is no distinction. And moreover in that this distinction is at the same time no distinction, it proceeds further and cancels this distinction again, since it lets force have just the same constitution as law. This process or necessity is, however, in this form, still a necessity and a process of understanding, or the process as such is not the *object* of understanding; instead, understanding has as its objects in that process positive and negative electricity, distance, velocity, force of attraction, and a thousand other things — objects which make up the content of the moments of the process. It is just for that reason that there is so much satisfaction in explanation, because consciousness being there, if we may use such an expression, in direct communion with itself, enjoys itself only. No doubt it there seems to be occupied with something else, but in point of fact it is busied all the while merely with itself.

In the opposite law, as the inversion of the first law, or in internal distinction, infinitude doubtless becomes itself object of understanding. But once more understanding fails to do justice to infinity as such, since understanding assigns again to two worlds, or to two substantial elements, that which is distinction *per se* — the self-repulsion of the selfsame, and the self-attraction of unlike factors. To understanding the process, as it is found in experience, is here an event that happens, and the selfsame and the unlike are predicates, whose reality is an underlying substratum. What is for understanding an object in a covering veil of sense, now comes before us in its essential form as a pure notion. This apprehension of distinction as it truly is, the apprehension of infinitude as such, is something *for us* [observing the course of the process], or is implicit, immanent. The exposition of its notion belongs to science. Consciousness, however, in the way it immediately has this notion, again appears as a peculiar form or *new attitude* of consciousness, which does not recognize its own essential nature in what has gone before, but looks upon it as something quite different.

In that this notion of infinitude is its object, it is thus a consciousness of the distinction as one which at the same time is at once cancelled. Consciousness is for itself and on its own account, it is a distinguishing of what is undistinguished, it is Self-consciousness. I distinguish myself from myself; and therein I am immediately aware that this factor distinguished from me is not distinguished. I, the selfsame being, thrust myself away from myself; but this which is distinguished, which is set up as unlike me, is immediately on its being distinguished no distinction for me. Consciousness of an other, of an object in general, is indeed itself necessarily self-consciousness, reflectedness into self, consciousness of self in its otherness. The necessary advance from the previous attitudes of consciousness, which found their true content to be a thing, something other than themselves, brings to light this very fact that not merely is consciousness of a thing only

possible for a self-consciousness, but that this self-consciousness alone is the truth of those attitudes. But it is only for us (who trace this process] that this truth is actually present; it is not yet so for the consciousness immersed in the experience. Self-consciousness has in the first instance become a specific reality on its own account (*für sich*), has come into being for itself; it is not yet in the form of unity with consciousness in general.

We see that in the inner being of the sphere of appearance, understanding gets to know in truth nothing else but appearance itself, not, however, appearance in the shape of a play of forces, but that play of forces in its absolutely universal moments and in the process of those moments; in fact, understanding merely experiences itself. Raised above perception, consciousness reveals itself united and bound up with the supersensible world through the mediating agency of the realm of appearance, through which it gazes into this background that lies behind appearance. The two extremes, the one that of the pure inner region, the other that of the inner being gazing into this pure inner region, are now merged together; and as they have disappeared *qua* extremes, the middle term, the mediating agency, *qua* something other than these extremes, has also vanished. This curtain [of appearance], therefore, hanging before the inner world is withdrawn, and we have here the inner being [the ego] gazing into the inner realm — the vision of the undistinguished selfsame reality, which repels itself from itself, affirms itself as a divided and distinguished inner reality, but as one for which at the same time the two factors have immediately no distinction; what we have here is Self-consciousness. It is manifest that behind the so-called curtain, which is to hide the inner world, there is nothing to be seen unless we ourselves go behind there, as much in order that we may thereby see, as that there may be something behind there which can be seen. But it is clear at the same time that we cannot without more ado go straightway behind there. For this knowledge of what is the truth of

the idea of the realm of appearance and of its inner being, is itself only a result arrived at after a long and devious process,, in the course of which the modes of consciousness, “meaning”, “perception”, and “understanding” disappear. And it will be equally evident that to get acquainted with what consciousness knows when it is knowing itself, requires us to fetch a still wider compass, What follows will set this forth at length.

B. Self-Consciousness

IV. THE TRUTH WHICH CONSCIOUS CERTAINTY OF SELF REALIZES

Translator's comments: The analysis of experience up to this point has been occupied with the relation of consciousness to an object admittedly different in nature from the mind aware of it. This external opposition, however, breaks down under analysis, and we are left with the result that consciousness does and must find itself in unity with its object, a unity which implies identity of nature between consciousness and its object: consciousness becomes "certain of itself in its object". This is not merely a result, but the truest expression of the initial relation with which experience starts. It is, therefore, the ground of the possibility of any relation between the terms in question: "consciousness of self" is the basis of the consciousness of anything whatsoever. This is Hegel's re-interpretation of the Kantian analysis of experience.

But this result is, again, really the starting-point for a further analysis of experience, but of experience at a higher level of realization. Consciousness of self is to begin with a general attitude, a definite type of experience, which requires elucidation. It has its own conditions and forms of manifestation. Self-consciousness, being supreme, must realize itself in relation to nature, to other selves similar to the self, and to the Ultimate Being of the world. These are different kinds of content with which consciousness is to find its oneness, and they furnish different forms in which the same principle is manifested. The argument seeks to show that these forms are also different degrees of realization of self-consciousness. The outcome of the argument is that self-consciousness is truly realized only when it is universal self-consciousness, when consciousness is certain

of itself throughout all reality, and explicitly finds there only itself. This result takes the form, as we shall see, of what is called *Reason*.

The immediately succeeding section takes up the first stage of the development of self-consciousness — the consciousness of self in relation to nature. This takes the shape of Desire, Instinct, Impulse, etc., and involves the category of Life. This relationship, while undoubtedly implying the sense of self in the object and consciousness of unity with it, is the least satisfying and the least complete of all the modes of self-consciousness. It points the way, therefore, to the fuller sense of self obtained when the self is aware of itself in relation to another self.

The Truth which Conscious Certainty Of Self Realizes

IN the kinds of certainty hitherto considered, the truth for consciousness is something other than consciousness itself. The conception, however, of this truth vanishes in the course of our experience of it. What the object immediately was *in itself* — whether mere being in sense-certainty, a concrete thing in perception, or force in the case of understanding — it turns out, in truth, not to be this really; but instead, this inherent nature (*Ansich*) proves to be a way in which it is for an other. The abstract conception of the object gives way before the actual concrete object, or the first immediate idea is cancelled in the course of experience. Mere certainty vanished in favour of the truth. There has now arisen, however, what was not established in the case of these previous relationships, viz. a certainty which is on a par with its truth, for the certainty is to itself its own object, and consciousness is to itself the truth. Otherness, no doubt, is also found there; consciousness, that is, makes a distinction; but what is distinguished is of such a kind that consciousness, at the same time, holds there is no distinction made. If we call the movement of knowledge conception, and

knowledge, *qua* simple unity or Ego, the object, we see that not only for us [tracing the process], but likewise for knowledge itself, the object corresponds to the conception; or, if we put it in the other form and call conception what the object is in itself, while applying the term object to what the object is *qua* object or *for an other*, it is clear that being "in-itself" and being "for an other" are here the same. For the inherent being (*Ansich*) is consciousness; yet it is still just as much that for which an other (viz. what is "in-itself") is. And it is *for* consciousness that the inherent nature (*Ansich*) of the object, and its "being for an other" *are* one and the same. Ego is the content of the relation, and itself the process of relating. It is Ego itself which is opposed to an other and, at the same time, reaches out beyond this other, which other is all the same taken to be only itself.

With self-consciousness, then, we have now passed into the native land of truth, into that kingdom where it is at home. We have to see how the form or attitude of self-consciousness in the first instance appears. When we consider this new form and type of knowledge, the knowledge of self, in its relation to that which preceded, namely, the knowledge of an other, we find, indeed, that this latter has vanished, but that its moments have, at the same time, been preserved; and the loss consists in this, that those moments are here present as they are implicitly, as they are in themselves. The being which "meaning" dealt with, particularity and the universality of perception opposed to it, as also the empty, inner region of understanding-these are no longer present as substantial elements (*Wesen*), but as moments of self-consciousness, i.e. as abstractions or differences, which are, at the same time, of no account for consciousness itself, or are not differences at all, and are purely vanishing entities (*Wesen*).

What seems to have been lost, then, is only the principal moment, viz. the simple fact of having independent subsistence for consciousness. But, in reality, self-consciousness is reflexion out of the bare being that belongs to

the world of sense and perception, and is essentially the return out of otherness. As self-consciousness, it is movement. But when it distinguishes only its self as such from itself, distinction is straightway taken to be superseded in the sense of involving otherness. The distinction is not, and self-consciousness is only motionless tautology, Ego is Ego, I am I. When for self-consciousness the distinction does not also have the shape of *being*, it is *not* self-consciousness. For self-consciousness, then, otherness is a fact, it does exist as a distinct moment; but the unity of itself with this difference is also a fact for self-consciousness, and is a second distinct moment. With that first moment, self-consciousness occupies the position of consciousness, and the whole expanse of the world of sense is conserved as its object, but at the same time only as related to the second moment, the unity of self-consciousness with itself. And, consequently, the sensible world is regarded by self-consciousness as having a subsistence which is, however, only appearance, or forms a distinction from self-consciousness that *per se* has no being. This opposition of its appearance and its truth finds its real essence, however, only in the truth — in the unity of self-consciousness with itself. This unity must become essential to self-consciousness, i.e. self-consciousness is the state of *Desire* in general. Consciousness has, *qua* self-consciousness, henceforth a twofold object — the one immediate, the object of sense-certainty and of perception, which, however, is here found to be marked by the character of negation; the second, viz. itself, which is the true essence, and is found in the first instance only in the opposition of the first object to it. Self-consciousness presents itself here as the process in which this opposition is removed, and oneness or identity with itself established.

For us or implicitly, the object, which is the negative element for self-consciousness, has on its side returned into itself, just as on the other side-consciousness has done. Through this reflexion into self, the object has

become *Life*. What self-consciousness distinguishes as having a being distinct from itself, has in it too, so far as it is affirmed to *be*, not merely the aspect of sense-certainty and perception; it is a being reflected into itself, and the object of immediate desire is something living. For the inherent reality (*Ansich*), the general result of the relation of the understanding to the inner nature of things, is the distinguishing of what cannot be distinguished, or is the unity of what is distinguished. This unity, however, is, as we saw, just as much its recoil from itself; and this conception breaks asunder into the opposition of self-consciousness and life: the former is the unity *for which* the absolute unity of differences exists, the latter, however, *is* only this unity itself, so that the unity is not at the same time *for itself.* Thus, according to the independence possessed by consciousness, is the independence which its object in itself possesses. Self-consciousness, which is absolutely *for itself,* and characterizes its object directly as negative, or is primarily desire, will really, therefore, find through experience this object's independence.

The determination of the principle of life as obtained from the conception or general result with which we enter this new sphere, is sufficient to characterize it, without its nature being evolved further out of that notion. Its circuit is completed in the following moments. The essential element (*Wesen*) is infinitude as the supersession of all distinctions, the pure rotation on its own axis, itself at rest while being absolutely restless infinitude, the very self-dependence in which the differences brought out in the process are all dissolved, the simple reality of time, which in this self-identity has the solid form and shape of space. The differences, however, all the same hold as differences in this simple universal medium; for this universal flux exercises its negative activity merely in that it is the sublation of them; but it could not transcend them unless they had a subsistence of their own. Precisely this flux is itself, as self-identical independence, their

subsistence or their substance, in which they accordingly are distinct members, parts which have being in their own right. Being no longer has the significance of mere abstract being, nor has their naked essence the meaning of abstract universality: their being now is just that simple fluent substance of the pure movement within itself. The difference, however, of these members *inter se* consists, in general, in no other characteristic than that of the moments of infinitude, or of the mere movement itself.

The independent members exist for themselves. To be thus for themselves, however, is really as much their reflexion directly into the unity, as this unity is the breaking asunder into independent forms. The unity is sundered because it is absolutely negative or infinite unity; and because it is subsistence, difference likewise has independence only in *it*. This independence of the form appears as a determinate entity, as what is for another, for the form is something disunited; and the cancelling of diremption takes effect to that extent through another. But this sublation lies just as much in the actual form itself. For just that flux is the substance of the independent forms. This substance, however, is infinite, and hence the form itself in its very subsistence involves diremption, or sublation of its existence for itself.

If we distinguish more exactly the moments contained here, we see that we have as first moment the subsistence of the independent forms, or the suppression of what distinction inherently involves, viz. that the forms have no being *per se,* and no subsistence. The second moment, however, is the subjection of that subsistence to the infinitude of distinction. In the first moment there is the subsisting, persisting mode or form; by its being in its own right, or by its being in its determinate shape an infinite substance, it comes forward in opposition to the universal substance, disowns this fluent continuity with that substance, and insists that it is not dissolved in this universal element, but rather on the contrary preserves itself by and through

its separation from this its inorganic nature, and by the fact that it consumes this inorganic nature. Life in the universal fluid medium, quietly, silently shaping and moulding and distributing the forms in all their manifold detail, becomes by that very activity the movement of those forms, or passes into life *qua Process*. The mere universal flux is here the inherent being; the outer being, the "other", is the distinction of the forms assumed. But this flux, this fluent condition, becomes itself the other in virtue of this very distinction; because now it exists "for" or m relation to that distinction, which is self-conditioned and self-contained (*an und für sich*), and consequently is the endless, infinite movement by which that stable medium is consumed — is life as living.

This inversion of character, however, is on that account again invertedness in itself as such. What is consumed is the essential reality: the Individuality, which preserves itself at the expense of the universal and gives itself the feeling of its unity with itself, precisely thereby cancels its contrast with the other, by means of which it exists for itself. The unity with self, which it gives itself, is just the fluent continuity of differences, or universal dissolution. But, conversely, the cancelling of individual subsistence at the same time produces the subsistence. For since the essence of the individual form-universal life-and the self-existent entity *per se* are simple substance, the essence, by putting the other within itself, cancels this its own simplicity or its essence, i.e. it sunders that simplicity; and this disruption of fluent undifferentiated continuity is just the setting up, the affirmation, of individuality. The simple substance of life, therefore, is the diremption of itself into shapes and forms, and at the same time the dissolution of these substantial differences; and the resolution of this diremption is just as much a process of diremption, of articulating. Thus both the sides of the entire movement which were before distinguished, viz., the setting *up of individual forms* lying apart and undisturbed in the

universal medium of independent existence, and the *process of life* — collapse into one another. The latter is just as much a formation of independent individual shapes, as it is a way of cancelling a shape assumed; and the former, the setting up of individual forms, is as much a cancelling as an articulation of them. The fluent, continuous element is itself only the abstraction of the essential reality, or it is actual only as a definite shape or form; and that it articulates itself is once more a breaking up of the articulated form, or a dissolution of it. The *entire* circuit of this activity constitutes Life. It is neither what is expressed to begin with, the immediate continuity and concrete solidity of its essential nature; nor the stable, subsisting form, the discrete individual which exists on its own account; nor the bare process of this form; nor again is it the simple combination of all these moments. It is none of these; it is the *whole* which develops itself, resolves its own development, and in this movement simply preserves itself.

Since we started from the first immediate unity, and returned through the moments of form-determination, and of process, to the unity of both these moments, and thus again back to the first simple substance, we see that this *reflected* unity is other than the first. As opposed to that immediate unity, the unity expressed as a mode of being, this second is the universal unity, which holds all these moments sublated within itself. It is the simple genus, which in the movement of life itself does not exist in this simplicity for itself; but in this result points life towards what is other than itself, namely, towards Consciousness for which life exists as this unity or as genus.

This other life, however, for which the genus as such exists and which is genus for itself, namely, self-con-sciousness, exists in the first instance only in the form of this simple, essential reality, and has for object itself *qua* pure Ego. In the course of its experience, which we are now to consider, this abstract object will grow in richness, and will be unfolded in the way we have seen in the case of life.

The simple ego is this genus, or the bare universal, for which the differences are insubstantial, only by its being the negative essence of the moments which have assumed a definite and independent form. And self-consciousness is thus only assured of itself through sublating this other, which is presented to self-consciousness as an independent life; self-consciousness is *Desire*. Convinced of the nothingness of this other, it definitely affirms this nothingness to be for itself the truth of this other, negates the independent object, and thereby acquires the certainty of its own self, as *true* certainty, a certainty which it has become aware of in objective form.

In this state of satisfaction, however, it has experience of the independence of its object. Desire and the certainty of its self obtained in the gratification of desire, are conditioned by the object; for the certainty exists through cancelling this other; in order that this cancelling may be effected, there must be this other. Self-consciousness is thus unable by its negative relation to the object to abolish it; because of that relation it rather produces it again, as well as the desire. The object desired is, in fact, something other than self-consciousness, the essence of desire; and through this experience this truth has become realized. At the same time, however, self-consciousness is likewise absolutely for itself, exists on its own account; and it is so only by sublation of the object; and it must come to feel its satisfaction, for it is the truth. On account of the independence of the object, therefore, it can only attain satisfaction when this object itself effectually brings about negation within itself The object must *per se* effect this negation of itself, for it is inherently (*an sich*) something negative, and must be for the other what it is. Since the object is in its very self negation, and in being so is at the same time independent, it is Consciousness. In the case of life, which is the object of desire, the negation *eithe*r lies in an other, namely, in desire, *or* takes the form of determinateness standing in

opposition to an other external individuum indifferent to it, *or* appears as its inorganic general nature. The above general independent nature, however, in the case of which negation takes the form of *absolute* negation, is the genus as such or as self-consciousness. Self-consciousness attains its satisfaction only in another self-consciousness.

It is in these three moments that the notion of self-consciousness first gets completed: (*a*) pure undifferentiated ego is its first immediate object. (*b*) This immediacy is itself, however, thoroughgoing mediation; it has its being only by cancelling the independent object, in other words it is Desire. The satisfaction of desire is indeed the reflexion of self-consciousness into itself, is the certainty which has passed into objective truth. But (*c*) the truth of this certainty is really twofold reflexion, the reduplication of self-consciousness. Consciousness has an object which implicates its own otherness or affirms distinction as a void distinction, and therein is independent. The individual form distinguished, which is only a living form, certainly cancels its independence also in the process of life itself; but it ceases along with its distinctive difference to be what it is. The object of self-consciousness, however, is still independent in this negativity of itself; and thus it is for itself genus, universal flux or continuity in the very distinctiveness of its own separate existence; it is a living self-consciousness.

A self-consciousness has before it a self-consciousness. Only so and only then *is* it self-consciousness in actual fact; for here first of all it comes to have the unity of itself in its otherness. Ego which is the object of its notion, is in point of fact not "*object*". The object of desire, however, is only independent, for it is the universal, ineradicable substance, the fluent self-identical essential reality. When a self-consciousness is the object, the object is just as much ego as object.

With this we already have before us the notion of *Mind* or *Spirit*. What consciousness has further to become aware of, is the experience of what mind is — this absolute substance, which is the unity of the different self-related and self-existent self-consciousnesses in the perfect freedom and independence of their opposition as component elements of that substance: Ego that is “we”, a plurality of Egos, and “we” that is a single Ego. Consciousness first finds in self-consciousness — the notion of mind — its turning-point, where it leaves the parti-coloured show of the sensuous immediate, passes from the dark void of the transcendent and remote super-sensuous, and steps into the spiritual daylight of the present.

A

Independence and Dependence of Self-Consciousness Lordship and Bondage

Translator’s comments: The selves conscious of self in another self are, of course, distinct and separate from each other. The difference is, in the first instance, a question of degree of self-assertion and self-maintenance: one is stronger, higher, more independent than another, and capable of asserting this at the expense of the other. Still, even this distinction of primary and secondary rests ultimately on their identity of constitution; and the course of the analysis here gradually brings out this essential identity as the true fact. The equality of the selves is the truth, or completer realization, of self in another self; the affinity is higher and more ultimate than the disparity. Still, the struggle and conflict of selves must be gone through in order to bring out this result. Hence the present section.

The background of Hegel’s thought is the remarkable human phenomenon of the subordination of one self to another which we have in all forms of servitude — whether slavery, serfdom, or voluntary service.

Servitude is not, only a phase of human history, it is in principle a condition of the development and maintenance of the consciousness of self as a fact of experience.

Lordship and Bondage

SELF-CONSCIOUSNESS exists in itself and for itself, in that, and by the fact that it exists for another self-consciousness; that is to say, it *is* only by being acknowledged or “recognized”. The conception of this its unity in its duplication, of infinitude realizing itself in self-consciousness, has many sides to it and encloses within it elements of varied significance. Thus its moments must on the one hand be strictly kept apart in detailed distinctiveness, and, on the other, in this distinction must, at the same time, also be taken as not distinguished, or must always be accepted and understood in their opposite sense. This double meaning of what is distinguished lies in the nature of self-consciousness:-of its being infinite, or directly the opposite of the determinateness in which it is fixed. The detailed exposition of the notion of this spiritual unity in its duplication will bring before us the process of Recognition.

Self-consciousness has before it another self-consciousness; it has come outside itself. This has a double significance. First it has lost its own self, since it finds itself as an *other* being; secondly, it has thereby sublated that other, for it does not regard the other as essentially real, but sees its own self in the other.

It must cancel this its other. To do so is the sublation of that first double meaning, and is therefore a second double meaning. First, it must set itself to sublate the other independent being, in order thereby to become certain of itself as true being, secondly, it thereupon proceeds to sublate its own self, for this other is itself.

This sublation in a double sense of its otherness in a double sense is at the same time a return in a double sense into its self. For, firstly, through sublation, it gets back itself, because it becomes one with itself again through the cancelling of *its* otherness; but secondly, it likewise gives otherness back again to the other self-consciousness, for it was aware of being in the other, it cancels this its own being in the other and thus lets the other again go free.

This process of self-consciousness in relation to another self-consciousness has in this manner been represented as the action of one alone. But this action on the part of the one has itself the double significance of being at once its own action and the action of that other as well. For the other is likewise independent, shut up within itself, and there is nothing in it which is not there through itself. The first does not have the object before it only in the passive form characteristic primarily of the object of desire, but as an object existing independently for itself, over which therefore it has no power to do anything for its own behalf, if that object does not *per se* do what the first does to it. The process then is absolutely the double process of both self-consciousnesses. Each sees the other do the same as itself; each itself does what it demands on the part of the other, and for that reason does what it does, only so far as the other does the same. Action from one side only would be useless, because what is to happen can only be brought about by means of both.

The action has then a *double entente* not only in the sense that it is an act done to itself as well as to the other, but also in the sense that the act *simpliciter is* the act of the one as well as of the other regardless of their distinction.

In this movement we see the process repeated which came before us as the play of forces; in the present case, however, it is found in consciousness. What in the former had effect only for us [contemplating experience], holds

here for the terms themselves. The middle term is self-consciousness which breaks itself up into the extremes; and each extreme is this interchange of its own determinateness, and complete transition into the opposite. While *qua* consciousness, it no doubt comes outside itself, still, in being outside itself, it is at the same time restrained within itself, it exists for itself, and its self-externalization is for consciousness. *Consciousness* finds that it immediately is and is not another consciousness, as also that this other is for itself only when it cancels itself as existing for itself, and has self-existence only in the self-existence of the other. Each is the mediating term to the other, through which each mediates and unites itself with itself; and each is to itself and to the other an immediate self existing reality, which, at the same time, exists thus for itself only through this mediation. They recognize themselves as mutually recognizing one another.

This pure conception of recognition, of duplication of self-consciousness within its unity, we must now consider in the way its process appears for self-consciousness. It will, in the first place, present the aspect of the disparity of the two, or the break-up of the middle term into the extremes, which, *qua* extremes, are opposed to one another, and of which one is merely recognized, while the other only recognizes.

Self-consciousness is primarily simple existence for self, self-identity by exclusion of every other from itself. It takes its essential nature and absolute object to be Ego; and in this immediacy, in this bare fact of its self-existence, it is individual. That which for it is other stands as unessential object, as object with the impress and character of negation. But the other is also a self-consciousness; an individual makes its appearance in antithesis to an individual. Appearing thus in their immediacy, they are for each other in the manner of ordinary objects. They are independent individual forms, modes of Consciousness that have not risen above the bare level of life (for the existent object here has been determined as life). They are, moreover,

forms of consciousness which have not yet accomplished for one another the process of absolute abstraction, of uprooting all immediate existence, and of being merely the bare, negative fact of self-identical consciousness; or, in other words, have not yet revealed themselves to each other as existing purely for themselves, i.e., as self-consciousness. Each is indeed certain of its own self, but not of the other, and hence its own certainty of itself is still without truth. For its truth would be merely that its own individual existence for itself would be shown to it to be an independent object, or, which is the same thing, that the object would be exhibited as this pure certainty of itself. By the notion of recognition, however, this is not possible, except in the form that as the other is for it, so it is for the other; each in its self through its own action and again through the action of the other achieves this pure abstraction of existence for self.

The presentation of itself, however, as pure abstraction of self-consciousness consists in showing itself as a pure negation of its objective form, or in showing that it is fettered to no determinate existence, that it is not bound at all by the particularity everywhere characteristic of existence as such, and is *not* tied up with life. The process of bringing all this out involves a twofold action — action on the part of the other and action on the part of itself. In so far as it is the other's action, each aims at the destruction and death of the other. But in this there is implicated also the second kind of action, self-activity; for the former implies that it risks its own life. The relation of both self-consciousnesses is in this way so constituted that they prove themselves and each other through a life-and-death struggle. They must enter into this struggle, for they must bring their certainty of themselves, the certainty of being for themselves, to the level of objective truth, and make this a fact both in the case of the other and in their own case as well. And it is solely by risking life that freedom is obtained; only thus is it tried and proved that the essential nature of self-

consciousness is not bare existence, is not the merely immediate form in which it at first makes its appearance, is not its mere absorption in the expanse of life. Rather it is thereby guaranteed that there is nothing present but what might be taken as a vanishing moment — that self-consciousness is merely pure self-existence, being-for-self. The individual, who has not staked his life, may, no doubt, be recognized as a Person; but he has not attained the truth of this recognition as an independent self-consciousness. In the same way each must aim at the death of the other, as it risks its own life thereby; for that other is to it of no more worth than itself the other's reality is presented to the former as an external other, as outside itself; it must cancel that externality. The other is a purely existent consciousness and entangled in manifold ways; it must view its otherness as pure existence for itself or as absolute negation.

This trial by death, however, cancels both the truth which was to result from it, and therewith the certainty of self altogether. For just as life is the natural "position" consciousness, independence without absolute negativity, so death is the natural "negation" of consciousness, negation without independence, which thus remains without the requisite significance of actual recognition. Through death, doubtless, there has arisen the certainty that both did stake their life, and held it lightly both in their own case and in the case of the other; but that is not for those who underwent this struggle. They cancel their consciousness which had its place in this alien element of natural existence; in other words, they cancel themselves and are sublated as terms or extremes seeking to have existence on their own account. But along with this there vanishes from the play of change the essential moment, viz. that of breaking up into extremes with opposite characteristics; and the middle term collapses into a lifeless unity which is broken up into lifeless extremes, merely existent and not opposed. And the two do not mutually give and receive one another back from each other

through consciousness; they let one another go quite indifferently, like things. Their act is abstract negation, not the negation characteristic of consciousness, which cancels in such a way that it preserves and maintains what is sublated, and thereby survives its being sublated.

In this experience self-consciousness becomes aware that *life* is as essential to it as pure self-consciousness. In immediate self-consciousness the simple ego is absolute object, which, however, is for us or in itself absolute mediation, and has as its essential moment substantial and solid independence. The dissolution of that simple unity is the result of the first experience; through this there is posited a pure self-consciousness, and a consciousness which is not purely for itself, but for another, i.e. as an existent consciousness, consciousness in the form and shape of thinghood. Both moments are essential, since, in the first instance, they are unlike and opposed, and their reflexion into unity has not yet come to light, they stand as two opposed forms or modes of consciousness. The one is independent, and its essential nature is to be for itself; the other is dependent, and its essence is life or existence for another. The former is the Master, or Lord, the latter the Bondsman.

The master is the consciousness that exists *for itself;* but no longer merely the general notion of existence for self. Rather, it is a consciousness existing on its own account which is mediated with itself through an other consciousness, i.e. through an other whose very nature implies that it is bound up with an independent being or with thinghood in general. The master brings himself into relation to both these moments, to a thing as such, the object of desire, and to the consciousness whose essential character is thinghood. And since the master, is (*a*) *qua* notion of self-consciousness, an immediate relation of self-existence, but (*b*) is now moreover at the same time mediation, or a being-for-self which is for itself only through an other — he [the master] stands in relation (*a*) immediately

to both (*b*) mediately to each through the other. The master relates himself to the bondsman mediately through independent existence, for that is precisely what keeps the bondsman in thrall; it is his chain, from which he could not in the struggle get away, and for that reason lie proved himself to be dependent, to have his independence in the shape of thinghood. The master, however, is the power controlling this state of existence, for he has shown in the struggle that lie holds it to be merely something negative. Since he is the power dominating existence, while this existence again is the power controlling the other [the bondsman], the master holds, *par consequence*, this other in subordination. In the same way the master relates himself to the thing mediately through the bondsman. The bondsman being a self-consciousness in the broad sense, also takes up a negative attitude to things and cancels them; but the thing is, at the same time, independent for him and, in consequence, he cannot, with all his negating, get so far as to annihilate it outright and be done with it; that is to say, lie merely works on it. To the master, on the other hand, by means of this mediating process, belongs the immediate relation, in the sense of the pure negation of it, in other words he gets the enjoyment. What mere desire did not attain, he now succeeds in attaining, viz. to have done with the thing, and find satisfaction in enjoyment. Desire alone did not get the length of this, because of the independence of the thing. The master, however, who has interposed the bondsman between it and himself, thereby relates himself merely to tile dependence of the thing, and enjoys it without qualification and without reserve. The aspect of its independence he leaves to the bondsman, who labours upon it.

In these two moments, the master gets his recognition through an other consciousness, for in them the latter affirms itself as unessential, both by working upon the thing, and, on the other hand, by the fact of being dependent on a determinate existence; in neither case can this other get the

mastery over existence, and succeed in absolutely negating it. We have thus here this moment of recognition, viz. that the other consciousness cancels itself as self-existent, and, *ipso facto,* itself does what the first does to it. In the same way we have the other moment, that this action on the part of the second is the action proper of the first; for what is done by the bondsman is properly an action on the part of the master. The latter exists only for himself, that is his essential nature; he is the negative power without qualification, a power to which the thing is naught. And he is thus the absolutely essential act in this situation, while the bondsman is not so, he is an unessential activity. But for recognition proper there is needed the moment that what the master does to the other he should also do to himself, and what the bondsman does to himself, he should do to the other also. On that account a form of recognition has arisen that is one sided and unequal.

In all this, the unessential consciousness is, for the master, the object which embodies the truth of his certainty of himself. But it is evident that this object does not correspond to its notion; for, just where the master has effectively achieved lordship, he really finds that something has come about quite different from an independent consciousness. It is not an independent, but rather a dependent consciousness that he has achieved. He is thus not assured of self-existence as his truth; he finds that his truth is rather the unessential consciousness, and the fortuitous unessential action of that consciousness.

The truth of the independent consciousness is accordingly the consciousness of the bondsman. This doubtless appears in the first instance outside itself, and not as the truth of self-consciousness. But just as lordship showed its essential nature to be the reverse of what it wants to be, so, too, bondage will, when completed, pass into the opposite of what it immediately is: being a consciousness repressed within itself, it will enter into itself, and change round into real and true independence.

We have seen what bondage is only in relation to lordship. But it is a self-consciousness, and we have now to consider what it is, in this regard, in and for itself. In the first instance, the master is taken to be the essential reality for the state of bondage; hence, for it, the truth is the independent consciousness existing for itself, although this truth is not taken yet as inherent in bondage itself. Still, it does in fact contain within itself this truth of pure negativity and self-existence, because it has experienced this reality within it. For this consciousness was not in peril and fear for this element or that, nor for this or that moment of time, it was afraid f or its entire being; it felt the fear of death, the sovereign master. It has been in that experience melted to its inmost soul, has trembled throughout its every fibre, and all that was fixed and steadfast has quaked within it. This complete perturbation of its entire substance, this absolute dissolution of all its stability into fluent continuity, is, however, the simple, ultimate nature of self-consciousness, absolute negativity, pure self-referrent existence, which consequently is involved in this type of consciousness. This moment of pure self-existence is moreover a fact for it; for in the master it finds this as its object. Further, this bondsman's consciousness is not only this total dissolution in a general way; in serving and toiling the bondsman actually carries this out. By serving he cancels in every particular aspect his dependence on and attachment to natural existence, and by his work removes this existence away.

The feeling of absolute power, however, realized both in general and in the particular form of service, is only dissolution implicitly; and albeit the fear of the lord is the beginning of wisdom, consciousness is not therein aware of being self-existent. Through work and labour, however, this consciousness of the bondsman comes to itself. In the moment which corresponds to desire in the case of the master's consciousness, the aspect of the non-essential relation to the thing seemed to fall to the lot of the

servant, since the thing there retained its independence. Desire has reserved to itself the pure negating of the object and thereby unalloyed feeling of self. This satisfaction, however, just for that reason is itself only a state of evanescence, for it lacks objectivity or subsistence. Labour, on the other hand, is desire restrained and checked, evanescence delayed and postponed; in other words, labour shapes and fashions the thing. The negative relation to the object passes into the form of the object, into something that is permanent and remains; because it is just for the labourer that the object has independence. This negative mediating agency, this activity giving shape and form, is at the same time the individual existence, the pure self-existence of that consciousness, which now in the work it does is externalized and passes into the condition of permanence. The consciousness that toils and serves accordingly attains by this means the direct apprehension of that independent being as its self.

But again, shaping or forming the object has not only the positive significance that the bondsman becomes thereby aware of himself as factually and objectively self-existent; this type of consciousness has also a negative import, in contrast with its moment, the element of fear. For in shaping the thing it only becomes aware of its own proper negativity, existence on its own account, as an object, through the fact that it cancels the actual form confronting it. But this objective negative element is precisely alien, external reality, before which it trembled. Now, however, it destroys this extraneous alien negative, affirms and sets itself up as a negative in the element of permanence, and thereby becomes for itself a self-existent being. In the master, the bondsman feels self-existence to be something external, an objective fact; in fear self-existence is present within himself; in fashioning the thing, self-existence comes to be felt explicitly as his own proper being, and he attains the consciousness that he himself exists in its own right and on its own account (*an und für sich*). By the fact

that the form is objectified, it does not become something other than the consciousness moulding the thing through work; for just that form is his pure self existence, which therein becomes truly realized. Thus precisely in labour where there seemed to be merely some outsider's mind and ideas involved, the bondsman becomes aware, through this re-discovery of himself by himself, of having and being a "mind of his own".

For this reflexion of self into self the two moments, fear and service in general, as also that of formative activity, are necessary: and at the same time both must exist in a universal manner. Without the discipline of service and obedience, fear remains formal and does not spread over the whole known reality of existence. Without the formative activity shaping the thing, fear remains inward and mute, and consciousness does not become objective for itself. Should consciousness shape and form the thing without the initial state of absolute fear, then it has a merely vain and futile "mind of its own"; for its form or negativity is not negativity *per se*, and hence its formative activity cannot furnish the consciousness of itself as essentially real. If it has endured not absolute fear, but merely some slight anxiety, the negative reality has remained external to it, its substance has not been through and through infected thereby. Since the entire content of its natural consciousness has not tottered and shaken, it is still inherently a determinate mode of being; having a "mind of its own" (*der eigene Sinn*) is simply stubbornness (*Eigensinn*), a type of freedom which does not get beyond the attitude of bondage. As little as the pure form can become its essential nature, so little is that form, considered as extending over particulars, a universal formative activity, an absolute notion; it is rather a piece of cleverness which has mastery within a certain range, but not over the universal power nor over the entire objective reality.

B

Freedom of Self-Consciousness Stoicism: Scepticism: The Unhappy Consciousness

Translator's comments: The previous section has established the self as ultimately a free self. But even this is abstract at first, and hence the attempt to maintain it must pass through different stages. These attempts have taken historical expression in European civilization, but these are merely instances of an experience that is strictly found in all mankind. Hegel, however, selects the forms assumed in European history, and has these in mind throughout the succeeding analysis. The terms Stoicism and Scepticism refer primarily to the forms which these assumed in Greece and Rome. The last stage of independent and free self-hood he names *faute de mieux*, the "unhappy consciousness". The background of historical material for this type of mind is found in the religious life of the Middle Ages and the mental attitude assumed under the dominion of the Roman Catholic Church and the Feudal Hierarchy. The social and political dissolution of the Roman Empire has its counterpart in the mental chaos and dissolution of Scepticism; the craving of free mind for absolute stability and constancy amid change and uncertainty found expression in an organized attempt on the part of the Church to establish permanent connection between man's mental insecurity and an Immutable Reality. The two poles of the antithesis were far removed from each other, and the method or methods adopted to bring about the union reflect the profound contrast of the opposing elements. It is the inner process of free mind in this realm of abstract subjective piety which Hegel analyses in the part termed the "unhappy consciousness"— "unhappy" because craving complete consciousness of self and never at this stage attaining it.

The end of this movement, and therefore the disappearance of all the onesidedness of abstract individual freedom of self, is found when, through the above struggle, there dawns on the self the consciousness of its

complete and explicit unity with reality in every shape and form. This is the beginning of the absolute sovereignty of the Mind — Consciousness of Reason as supreme. The change to this new condition found historical expression in the Reformation and the Renaissance.

Independent self-consciousness partly finds its essential reality in the bare abstraction of Ego. On the other hand, when this abstract ego develops further and forms distinctions of its own, this differentiation does not become an objective inherently real content for that self-consciousness. Hence this self consciousness does not become an ego which truly differentiates itself in its abstract simplicity, or one which remains identical with itself in this absolute differentiation. The repressed and subordinate type of consciousness, on the other hand, becomes, in the formative activity of work, an object to itself, in the sense that the form, given to the thing when shaped and moulded, is his object; he sees in the master, at the same time, self-existence as a real mode of consciousness. But the subservient consciousness as such finds these two moments fall apart — the moment of itself as an independent object, and the moment of this object as a mode of consciousness, and so its own proper reality. Since, however, the form and the self-existence are for us, or objectively in themselves, one and the same, and since in the notion of independent consciousness the inherent reality is consciousness, the phase of inherent existence (*Ansichsein*) or thinghood, which received its shape and form through labour, is no other substance than consciousness. In this way we have a new attitude or mode of consciousness brought about: a type of consciousness which takes on the form of infinitude, or one whose essence consists in unimpeded movement of consciousness. It is one which *thinks* or is free self-consciousness. For thinking does not mean being an abstract ego, but an ego which has at the same time the significance of inherently existing in itself; it means being

object to itself or relating itself to objective reality in such a way that this connotes the self-existence of that consciousness for which it is an object. The object does not for thinking proceed by way of presentations or figures, but of notions, conceptions, i.e. of a differentiated reality or essence, which, being an immediate content of consciousness, is nothing distinct from it. What is presented, shaped and constructed, and existent as such, has the form of being something other than consciousness. A notion, however, is at the same time an existent, and this distinction, so far as it falls in consciousness itself, is its determinate content. But in that this content is, at the same time, a conceptually constituted, a comprehended (*begriffener*) content, consciousness remains immediately aware within itself of its unity with this determinate existent so distinguished; not as in the case of a presentation, where consciousness from the first has to take special note that this is its idea; on the contrary, the notion is for me *eo ipso* and at once *my* notion. In thinking I am free, because I am not in an other, but remain simply and solely in touch with myself; and the object which for me is my essential reality, is in undivided unity my self-existence; and my procedure in dealing with notions is a process within myself.

It is essential, however, in this determination of the above attitude of self-consciousness to keep hold of the fact that this attitude is thinking consciousness in general, that its object is immediate unity of the self's implicit, inherent existence, and of its existence explicitly for self. The self-same consciousness which repels itself from itself, becomes aware of being an element existing in itself. But to itself it is this element to begin with only as universal reality in general, and not as this essential reality appears when developed in all the manifold details it contains, when the process of its being brings out all its fullness of content.

This freedom of self-consciousness, as is well known, has been called *Stoicism*, in so far as it has appeared as a phenomenon conscious of itself in

the course of the history of man's spirit. Its principle is that consciousness is essentially that which thinks, is a thinking reality, and that anything is really essential for consciousness, or is true and good, only when consciousness in dealing with it adopts the attitude of a thinking being.

The manifold, self-differentiating expanse of life, with all its individualization and complication, is the object upon which desire and labour operate. This varied activity has now contracted itself into the simple distinction which is found in the pure process of thought. What has still essential reality is not a distinction in the sense of a determinate thing, or in the shape of a consciousness of a determinate kind of natural existence, in the shape of a feeling, or again in the form of desire and its specific purpose, whether that purpose be set up by the consciousness desiring or by an extraneous consciousness. What has still essential significance here is solely that distinction which is a thought-constituted distinction, or which, when made, is not distinguished from me. This consciousness in consequence takes a negative attitude towards the relation of lordship and bondage. Its action, in the case of the master, results in his not simply having his truth in and through the bondsman; and, in that of the bondsman, in not finding his truth in the will of his master and in service. The essence of this consciousness is to be free, on the throne as well as in fetters, throughout all the dependence that attaches to its individual existence, and to maintain that stolid lifeless unconcern which persistently withdraws from the movement of existence, from effective activity as well as from passive endurance, into the simple essentiality of thought. Stubbornness is that freedom which makes itself secure in a solid singleness, and keeps *within* the sphere of bondage. Stoicism, on the other hand, is the freedom which ever comes directly out of that spheres and returns back into the pure universality of thought. It is a freedom which can come on the scene as a general form of the world's spirit only in a time of universal fear and

bondage, a time, too, when mental cultivation is universal, and has elevated culture to the level of thought.

Now while this self-consciousness finds its essential reality to be neither something other than itself, nor the pure abstraction of ego, but ego which has within it otherness-otherness in the sense of a thought-constituted distinction-so that this ego in its otherness is turned back directly into itself; yet this essential nature is, at the same time, only an abstract reality. The freedom of self-consciousness is indifferent towards natural existence, and has, therefore, let this latter go and remain free. The reflexion is thus duplicated. Freedom of thought takes only pure thought as its truth, and this lacks the concrete filling of life. It is, therefore, merely the notion of freedom, not living freedom itself; for it is, to begin with, only thinking in general that is its essence, the form as such, which has turned away from the independence of things and gone back into itself. Since, however, individuality when acting should: show itself to be alive, or when thinking should grasp the living world as a system of thought, there ought to lie in thought itself a content to supply the sphere of the ego, in the former case with what is good, and, in the latter, true, in order that there should throughout be no other ingredient in what consciousness has to deal with, except the notion which is the real essence. But here, by the way in which the notion as an abstraction cuts itself off from the multiplicity of things, the notion has *no content in itself*; the content is a datum, is given. Consciousness, no doubt, abolishes the content as an external, a foreign existent, by the fact that it thinks it, but the notion is a determinate notion, and this *determinateness* of the notion is the alien element the notion contains within it. Stoicism, therefore, got embarrassed, when, as the expression went, it was asked for the criterion of truth in general, i.e properly speaking, for a *content* of thought itself. To the question, what is good and true, it responded by giving again the abstract, contentless

thought; the true and good are to consist in reasonableness. But this self-identity of thought is simply once more pure form, in which nothing is determinate. The general terms true and good, wisdom and virtue, with which Stoicism has to stop short, are, therefore, in a general way, doubtless elevating; but seeing that they cannot actually and in fact reach any expanse of content, they soon begin to get wearisome.

This thinking consciousness, in the way in which it is thus constituted, as abstract freedom, is therefore only incomplete negation of otherness. Withdrawn from existence solely into itself, it has not there fully vindicated itself as the absolute negation of this existence. The content is held indeed to be only thought, but is thereby also taken to be determinate thought, and at the same time determinateness as such.

Scepticism is the realisation of that of which Stoicism is merely the notion, and is the actual experience of what freedom of thought is; it is in itself and essentially the negative, and must so exhibit itself. With the reflexion of self-consciousness into the simple, pure thought of itself, independent existence or permanent determinateness has, in contrast to that reflexion, dropped as a matter of fact out of the infinitude of thought. In Scepticism, the entire unessentiality and unsubstantiality of this "other" becomes a reality for consciousness. Thought becomes thinking which wholly annihilates the being of the world with its manifold determinateness, and the negativity of free self-consciousness becomes aware of attaining, in these manifold forms which life assumes, real negativity.

It is clear from the foregoing that, just as Stoicism answers to the *notion* of independent consciousness, which appeared as a relation of lordship and bondage, Scepticism, on its side, corresponds to its realization, to the negative attitude towards otherness, to desire and labour. But if desire and work could not carry out for self-consciousness the process of negation, this polemical attitude towards the manifold substantiality of things will, on the

other hand, be successful, because it turns against them as a free self-consciousness, and one complete within itself beforehand; or, expressed more definitely, because it has inherent in itself thought or the principle of infinitude where the independent elements in their distinction from one another are held to be merely vanishing quantities. The differences, which, in the pure thinking of self are only the *abstraction* of differences, become here the whole of the differences; and every differentiated existent becomes a difference of self-consciousness.

With this we get determined the action of Scepticism in general, as also its mode and nature. It shows the dialectic movement, which is sense-certainty, perception, and understanding. It shows, too, the unessentiality of that which holds good in the relation of master and servant, and which for abstract thought itself passes as determinate. That relation involves, at the same time, a determinate situation, in which there are found even moral laws, as commands of the sovereign lord. The determinations in abstract thought, however, are scientific notions, into which formal contentless thought expands itself, attaching the notion, as a matter of fact in merely an external fashion, to the existence independent of it, and holding as valid only determinate notions, albeit they are still pure abstractions.

Dialectic as a negative process, taken immediately as it stands, appears to consciousness, in the first instance, as something at the mercy of which it is, and which does not exist through consciousness itself. In Scepticism, on the other hand, this negative process is a moment of self-consciousness, which does not simply find its truth and its reality vanish, without self-consciousness knowing how, but rather which, in the certainty of its own freedom, itself makes this other, so claiming to be real, vanish. Self-consciousness here not only makes the objective as such to disappear before the negations of Scepticism but also its own function in relation to the object, where the object is held to be objective and made good — i.e. its

function of perceiving as also its process of securing what is in danger of being lost, viz. sophistry and *its* self-constituted and self-established truth. By means of this self-conscious negation, self-consciousness procures for itself the certainty of its own freedom, brings about the experience of that freedom, and thereby raises it into the truth. What vanishes is what is determinate, the difference which, no matter what its nature or whence it comes, sets up to be fixed and unchangeable. The difference has nothing permanent in it, and must vanish before thought because to be differentiated just means not to have being in itself, but to have its essential nature solely in an other. Thinking, however, is the insight into this character of what is differentiated; it is the negative function in its simple, ultimate form.

Sceptical self-consciousness thus discovers, in the flux and alternation of all that would stand secure in its presence, its own freedom, as given by and received from its own self. It is aware of being this of self-thinking thought, the unalterable and genuine certainty of its self. This certainty does not arise as a result out of something extraneous and foreign which stowed away inside itself its whole complex development; a result which would thus leave behind the process by which it came to be. Rather consciousness itself is thoroughgoing dialectical restlessness, this mêlée of presentations derived from sense and thought, whose differences collapse into oneness, and whose identity is similarly again resolved and dissolved — for this identity is itself determinateness as contrasted with non-identity. This consciousness, however, as a matter of fact, instead of being a self-same consciousness, is here neither more nor less than an absolutely fortuitous embroglio, the giddy whirl of a perpetually self-creating disorder. This is what it takes itself to be; for itself maintains and produces this self-impelling confusion. Hence it even confesses the fact; it owns to being, an entirely fortuitous *individual* consciousness — a consciousness which is empirical, which is directed upon what admittedly has no reality for it,

which obeys what, in its regard, has no essential being, which realizes and does what it knows to have no truth. But while it passes in this manner for an individual, isolated. contingent, in fact animal life, and a lost self-consciousness, it also, on the contrary, again turns itself into universal self-sameness; for it is the negativity of all singleness and all difference. From this self-identity, or rather within its very self, it falls back once more into that contingency and confusion, for this very self-directed process of negation has to do solely with what is single and individual, and is occupied with what is fortuitous. This form of consciousness is, therefore, the aimless fickleness and instability of going to and fro, hither and thither, from one extreme of self-same self-consciousness, to the other contingent, confused and confusing consciousness. It does not itself bring these two thoughts of itself together. It finds its freedom, at one time, in the form of elevation above all the whirling complexity and all the contingency of mere existence, and again, at another time, likewise confesses to falling back upon what is unessential, and to being taken up with that. It lets the unessential content in its thought vanish; but in that very act it is the consciousness of something unessential. It announces absolute disappearance but the announcement *is*, and this consciousness is the evanescence expressly announced. It announces the nullity of seeing, hearing, and so on, yet *itself* sees and hears. It proclaims the nothingness of essential ethical principles, and makes those very truths the sinews of its own conduct. Its deeds and its words belie each other continually; and itself, too, has the doubled contradictory consciousness of immutability and sameness, and of utter contingency and non-identity with itself. But it keeps asunder the poles of this contradiction within itself; and bears itself towards the contradiction as it does in its purely negative process in general. If sameness is shown to it, it points out unlikeness, non-identity; and when the latter, which it has expressly mentioned the moment before, is held up to it,

it passes on to indicate sameness and identity. Its talk, in fact, is like a squabble among self-willed children, one of whom says A when the other says B, and again B, when the other says A, and who, through being in contradiction with themselves, procure the joy of remaining in contradiction with one another.

In Scepticism consciousness gets, in truth, to know itself as a consciousness containing contradiction within itself. From the experience of this proceeds a new attitude which brings together the two thoughts which Scepticism holds apart. The want of intelligence which Scepticism manifests regarding itself is bound to vanish, because it is in fact one consciousness which possesses these two modes within it. This new attitude consequently is one which is aware of being the double consciousness of itself as self-liberating, unalterable, self-identical, and as utterly self-confounding, self-perverting; and this new attitude is the consciousness of this contradiction within itself.

In Stoicism, self-consciousness is the bare and simple freedom of itself. In Scepticism, it realizes itself, negates the other side of determinate existence, but, in so doing, really doubles itself, and is itself now a duality. In this way the duplication, which previously was divided between two individuals, the lord and the bondsman, is concentrated into one. Thus we have here that dualizing of self-consciousness within itself, which lies essentially in the notion of mind; but the unity of the two elements is not yet present. Hence the *Unhappy Consciousness* the Alienated Soul which is the consciousness of self as a divided nature, a doubled and merely contradictory being.

This unhappy consciousness, divided and at variance within itself, must, because this contradiction of its essential nature is felt to be a single consciousness, always have in the one consciousness the other also; and thus must be straightway driven out of each in turn, when it thinks it has

therein attained to the victory and rest of unity. Its true return into itself, or reconciliation with itself, will, however, display the notion of mind endowed with a life and existence of its own, because it implicitly involves the fact that, while being an undivided consciousness, it is a double-consciousness. It is itself the gazing of one self-consciousness into another, and itself is both, and the unity of both is also its own essence; but objectively and consciously it is not yet this essence itself — is not yet the unity of both.

Since, in the first instance, it is the immediate, the implicit unity of both, while for it they are not one and the same, but opposed, it takes one, namely, the simple unalterable, as essential, the other, the manifold and changeable as the unessential. For it, both are realities foreign to each other. Itself, because consciousness of this contradiction, assumes the aspect of changeable consciousness and is to itself the unessential; but as consciousness of unchangeableness, of the ultimate essence, it must, at the same time, proceed to free itself from the unessential, i.e. to liberate itself from itself. For though in its own view it is indeed only the changeable, and the unchangeable is foreign and extraneous to it, yet itself is simple, and therefore unchangeable consciousness, of which consequently it is conscious as its essence, but still in such wise that itself is again in its own regard not this essence. The position, which it assigns to both, cannot, therefore, be an indifference of one to the other, i.e. cannot be an indifference of itself towards the unchangeable. Rather it is immediately both itself; and the relation of both assumes for it the form of a relation of essence to the non-essential, so that this latter has to be cancelled; but since both are to it equally essential and are contradictory, it is only the conflicting contradictory process in which opposite does not come to rest in its own opposite, but produces itself therein afresh merely as an opposite.

Here then, there is a struggle against an enemy, victory over whom really means being worsted, where to have attained one result is really to lose it in the opposite. Consciousness of life, of its existence and action, is merely pain and sorrow over this existence and activity; for therein consciousness finds only consciousness of its opposite as its essence — and of its own nothingness. Elevating itself beyond this, it passes to the unchangeable. But this elevation is itself this same consciousness. It is, therefore, immediately consciousness of the opposite, viz. of itself as single, individual, particular. The unchangeable, which comes to consciousness, is in that very fact at the same time affected by particularity, and is only present with this latter. Instead of particularity having been abolished in the consciousness of immutability, it only continues to appear there still.

In this process, however, consciousness experiences just this appearance of particularity in the unchangeable, and of the unchangeable in particularity. Consciousness becomes aware of particularity in general in the immutable essence, and at the same time it there finds its own particularity. For the truth of this process is precisely that the double consciousness is one and single. This unity becomes a fact to it, but in the first instance the unity is one in which the diversity of both factors is still the dominant feature. Owing to this, consciousness has before it the threefold way in which particularity is connected with unchangeableness. In one form it comes before itself as opposed to the unchangeable essence, and is thrown back to the beginning of that struggle, which is, from first to last, the principle constituting the entire situation. At another time it finds the unchangeable appearing in the form of particularity; so that the latter is an embodiment of unchangeableness, into which, in consequence, the entire form of existence passes. In the third case, it discovers *itself* to be this particular fact in the unchangeable. The first unchangeable is taken to be merely the alien, external Being, which passes sentence on particular existence; since the

second unchangeable is a form or mode of particularity like itself, it, i.e. the consciousness, becomes in the third place spirit (*Geist*), has the joy of finding itself therein, and becomes aware within itself that its particularity has been reconciled with the universals.

What is set forth here as a mode and relation of the unchangeable, came to light as the experience through which self-consciousness passes in its unhappy state of diremption. This experience is now doubtless not its own onesided process; for it is itself unchangeable consciousness; and this latter consequently, is a particular consciousness as well; and the process is as much a process of that unchangeable consciousness, which makes its appearance there as certainly as the other. For that movement is carried on in these moments: an unchangeable now opposed to the particular in general, then, being itself particular, opposed to the other particular, and finally at one with it. But this consideration, so far as it is our affair, is here out of place, for thus far we have only had to do with unchangeableness as unchangeableness of *consciousness*, which, for that reason, is not true immutability, but is still affected with an opposite; we have not had before us the unchangeable *per se* and by itself; we do not, therefore, know how this latter will conduct itself. What has here so far come to light is merely this that to consciousness, which is our object here, the determinations above indicated appear in the unchangeable.

For this reason, then, the unchangeable consciousness also preserves, in its very form and bearing, the character and fundamental features of diremption and separate self-existence, as against the particular consciousness. For the latter it is thus altogether a contingency, a mere chance event, that the unchangeable receives the form of particularity; just as the particular consciousness merely happens to find itself opposed to the unchangeable, and therefore has this relation *per naturam*. Finally that it *finds itself* in the unchangeable appears to the particular consciousness to be

brought about partly, no doubt, by itself, or to take place for the reason that itself is particular; but this union, both as regards its origin as well as in its being, appears partly also due to the unchangeable; and the opposition remains within. this unity itself. In point of fact, through the unchangeable assuming a definite form, the "beyond", as a moment, has not only remained, but really is more securely established. For if the remote "beyond" seems indeed brought closer to the individual by this particular form of realization, on the other hand, it is henceforward fixedly opposed to the individual, a sensuous, impervious unit, with all the hard resistance of what is actual. The hope of becoming one therewith must remain a hope, i.e. without fulfilment, without present fruition; for between the hope and fulfilment there stands precisely the absolute contingency, or immovable indifference, which is involved in the very assumption of determinate shape and form, the basis and foundation of the hope. By the nature of this existent unit, through the particular reality it has assumed and adopted, it comes about of necessity that it becomes a thing of the past, something that has been somewhere far away, and absolutely remote it remains.

If, at the beginning, the bare notion of the sundered consciousness involved the characteristic of seeking to cancel it, *qua* particular consciousness, and become the unchangeable consciousness, the direction its effort henceforth takes is rather that of cancelling its relation to the pure unchangeable, without shape or embodied form, and of adopting only the relation to the unchangeable which has form and shape. For the oneness of the particular consciousness with the unchangeable is henceforth its object and the essential reality for it, just as in the mere notion of it the essential object was merely the formless abstract unchangeable: and the relation found in this absolute disruption, characteristic of its notion, is now what it has to turn away from. The external relation, however, primarily adopted to the formed and embodied unchangeable, as being an alien extraneous

reality, must be transmuted and raised to that of complete and thoroughgoing fusion and identification.

The process through which the unessential consciousness strives to attain this oneness, is itself a triple process, in accordance with the threefold character of the relation which this consciousness takes up to its transcendent and remote reality embodied in specific form. In one it is a pure consciousness; at another time a particular individual who takes up towards actuality the attitude characteristic of desire and labour; and in the third place it is a consciousness of its self-existence, its existence for itself. We have now to see how these three modes of its being are found and are constituted in that general relation'

In the first place, then, regarded as pure consciousness, the unchangeable embodied in definite historical form seems, since it is an object for pure consciousness, to be established as it is in its self-subsistent reality. But this, its reality in and for itself, has not yet come to light, as we already remarked. Were it to be in consciousness as it is in itself and for itself, this would certainly have to come about not from the side of consciousness, but from the unchangeable. But, this being so, its presence here is brought about through consciousness only in a one-sided way to begin with, and just for that reason is not found in a perfect and genuine form, but constantly weighted and encumbered with imperfection, with an opposite.

But although the "unhappy consciousness" does not possess this actual presence, it has, at the same time, transcended pure thought, so far as this is the abstract thought of Stoicism, which turns away from particulars altogether, and again the merely restless thought of Scepticism — so far, in fact, as this is merely particularity in the sense of aimless contradiction and the restless process of contradictory thought. It has gone beyond both of these; it brings and keeps together pure thought and particular existence, but has not yet risen to that level of thinking where the particularity of

consciousness is harmoniously reconciled with pure though itself. It rather stands midway, at the point where abstract thought comes in contact with the particularity of consciousness *qua* particularity. Itself *is* this act of contact; it is the union of pure thought and individuality; and this thinking individuality or pure thought also exists as object for it, and the unchangeable is essentially itself an individual existence. But that this its object, the unchangeable, which assumes essentially the form of particularity, is *its own self*, the self which is particularity of consciousness-this is *not* established *for it*.

In this first condition, consequently, in which we treat it as pure consciousness, it takes up towards its object an attitude which is not that of thought; but rather (since it is indeed in itself pure thinking particularity and its object is just this pure thought, but pure thought is not their relation to one another as such), it, so to say, merely gives itself up to thought, devotes itself to thinking (*geht an das Denken hin*), and is the state of Devotion (*Andacht*). Its thinking as such is no more than the discordant clang of ringing bells, or a cloud of warm incense, a kind of thinking in terms of music, that does not get the length of notions, which would be the sole, immanent, objective mode of thought. This boundless pure inward feeling comes to have indeed its object; but this object does not make its appearance in conceptual form, and therefore comes on the scene as something external and foreign. Hence we have here the inward movement of pure emotion (*Gemüth*) which feels itself, but feels itself in the bitterness of soul-diremption. It is the movement of an infinite Yearning, which is assured that its nature is a pure emotion of this kind, a pure thought which thinks itself as particularity-a yearning that is certain of being known and recognized by this object, for the very reason that this object thinks itself as particularity. At the same time, however, this nature is the unattainable “beyond” which, in being seized, escapes or rather has already escaped. The

“beyond” has already escaped. for it is in part the unchangeable, thinking itself as particularity, and consciousness, therefore, attains itself therein immediately — attains itself, but as something opposed to the unchangeable; instead of grasping, the real nature consciousness merely *feels*, and has fallen back upon itself. Since, in thus attaining itself, consciousness cannot keep itself at a distance as this opposite, it has merely laid hold of what is un. essential instead of having seized true reality. Thus, just as. on one side, when striving to find itself in the essentially real, it only lays hold of its own divided state of existence, so, too, on the other side, it cannot grasp that other [the essence] as particular or as concrete. That “other” cannot be found where it is sought; for it is meant to be just a “beyond”, that which can *not* be found. When looked for as a particular it is not universal, a thought-constituted particularity, not notion, but particular in the sense of an object, or a concrete actual, an object of immediate sense-consciousness, of sense certainty; and just for that reason it is only one which has disappeared. Consciousness, therefore, can only come upon the *grave* of its life. But because this is itself an actuality, and since it is contrary to the nature of actuality to afford a lasting possession, the presence even of that tomb is merely the source of trouble, toil, and struggle, a fight which must be lost. But since consciousness has found out by experience that the grave of its actual unchangeable Being has no concrete actuality, that the vanished particularity *qua* vanished is not true particularity, it will give up looking for the unchangeable particular existence as something actual, or will cease trying to hold on to what has thus vanished. Only so is it capable of finding particularity in a true form, a form that is universal.

In the first instance, however, the withdrawal of the emotional life into itself is to be taken in such a way that this life of feeling, in its own regard, *has* actuality *qua* particular existence. It is pure emotion which, for us or

per se, has found *itself* and satiated itself, for although it is, no doubt, aware in feeling that the ultimate reality is cut off from it, yet in itself this feeling is *self-feeling;* it has felt the object of its own pure feeling, and this object is its own self. It thus comes forward here as self-feeling, or as something actual on its own account. In this return into self, we find appearing its second attitude, the condition of desire and labour, which ensures for consciousness the inner certainty of its own self (which, as we saw, it has obtained) by the process of cancelling and enjoying the alien external reality, existence in the form of independent things. The unhappy consciousness, however, finds itself merely desiring and toiling; it is not consciously and directly aware that so to find itself rests upon the inner certainty of its self, and that its feeling of real being is this self-feeling. Since it does not in its own view have that certainty, its inner life really remains still a shattered certainty of itself; that confirmation of its own existence which it would receive through work and enjoyment, is, therefore, just as tottering and insecure; in other words, it must consciously nullify this certification of its own being, so as to find therein confirmation indeed, but confirmation only of what it is *for itself,* viz. of its disunion.

The actual reality, on which desire and work are directed, is, from the point of view of this consciousness, no longer something in itself null and void, something merely to be destroyed and consumed; but rather something like that consciousness itself, a reality broken in sunder, which is only in one respect essentially null, but in another sense also a consecrated world. This reality is a form and embodiment of the unchangeable, for the latter has in itself preserved particularity; and because, *qua* unchangeable, it is a universal, its particularity as a whole has the significance of all actuality.

If consciousness were, for itself, an independent consciousness, and reality were taken to be in and for itself of no account, then consciousness

would attain, in work and enjoyment, the feeling of its own independence, by the fact that its consciousness would be that which cancels reality. But since this reality is taken to be the form and shape of the unchangeable, consciousness is unable of itself to cancel that reality. On the contrary, seeing that, consciousness manages to nullify reality and to obtain enjoyment, this must come about through the unchangeable itself when it disposes of its own form and shape and delivers this up for consciousness to enjoy.

Consciousness, on its part, appears here likewise as actual, though, at the same time, as internally shattered; and this diremption shows itself in the course of toil and enjoyment, to break up into a relation to reality, or existence for itself, and into an existence in itself. That relation to actuality is the process of alteration, or acting, the existence for itself, which belongs to the particular consciousness as such. But therein it is also in itself; this aspect belongs to the unchangeable "beyond". This aspect consists in faculties and powers: an external gift, which the unchangeable here hands over for the consciousness to make use of.

In its action, accordingly, consciousness, in the first instance, has its being in the relation of two extremes. On one side it takes its stand as the active present (*Diesseits*),and opposed to it stands passive reality: both in relation to each other, but also both withdrawn into the unchangeable, and firmly established in themselves. From both sides, therefore, there is detached merely a superficial element to constitute their opposition; they are only opposed at the surface, and the play of opposition, the one to the other, takes place there.

The extreme of passive reality is sublated by the active extreme. Actuality can, however, on its own side, be sublated only because its own changeless essence sublates it, repels itself from itself, and hands over to the mercy of the active extreme what is thus repelled. Active force appears as

the power wherein actual reality is dissolved. For that reason, however, this consciousness, to which the inherent reality, or ultimate essence. is an "other", regards this power (which is the way it appears when active), as "the beyond", that which lies remote from its self. Instead, therefore, of returning out of its activity into itself, and instead of having confirmed itself as a fact for its self, consciousness reflects back this process of action into the other extreme, which is thereby represented as purely universal, as absolute might, from which the movement in every direction started, and which is the essential life of the self-disintegrating extremes, as they at first appeared, and of the process of change as well.

In that the unchangeable consciousness contemns, its specific shape and form, and abandons it entirely, while, on the other hand, the individual consciousness "gives thanks", i.e. denies itself the satisfaction of being conscious of its independence, and refers the essential substance of its action to the "beyond" and not to itself: by these two moments, in which both parts give themselves up the one to the other, there certainly arises in consciousness a sense of *its own* unity with the unchangeable. But, at the same time, this unity is affected with division, is again broken within itself and out of this unity there once more comes the opposition of universal and particular. For consciousness, no doubt, in appearance renounces the satisfaction of its self feeling, but it gets the actual satisfaction of that feeling, for it *has* been desire, work, and enjoyment; *qua* consciousness it has willed, has acted, has enjoyed. Its thanks similarly, in which it recognizes the other extreme as its true reality, and cancels itself, is itself its own act, which counterbalances the action of the other extreme, and meets with a like act the benefit handed over. If the former yields to consciousness merely its superficial content, yet consciousness still expresses thanks; and since it gives up its own action, i.e. its very essence, it, properly speaking, does more thereby than the other, which only renounces an outer surface.

The entire process, therefore, is reflected into the extreme of particularity, not merely in actual desire, labour, and enjoyment, but even in the expression of thanks, where the reverse seems to take place. Consciousness feels itself therein as this particular individual, and does not let itself be deceived by the semblance of its renunciation; for the real truth of that procedure is that it has not given itself up. What has come about is merely the double reflection into both extremes; and the result is to repeat the cleavage into the opposed consciousness of the unchangeable and the consciousness of a contrasted opposite in the shape of willing, performing, enjoying, and of self-renunciation itself, or, in general, of self-existent particularity.

With this has come to light the third stage in the movement of this consciousness, a situation which follows from the second and one which in truth has, by its will and by its performance, proved itself independent. In the first situation we had only a "notion" of actual consciousness, the inward emotion, which is not yet real in action and enjoyment. The second is this actualization, as an external express action and enjoyment. With the return out of this stage, however, it is that which has got to know itself as a real and effective consciousness, or that whose truth consists in being in and for itself. But herein the enemy is discovered in its special and most peculiar form. In the battle of emotion this individual consciousness has the sense of being merely a tune, an abstract moment. In work and enjoyment. which are the realization of this unsubstantial existence, it can readily forget itself, and the consciousness of its own proper life found in this realization is overborne by grateful recognition, But this overthrow of its proper distinctiveness is in truth a return of consciousness into itself, and moreover into itself as the general reality.

This third attitude, wherein this genuine reality is one term, consists in so relating this reality to absolute universal Being, as to show it to be mere

nothingness. The course of this relation we have still to consider.

To begin with, as regards the contrasted relation of consciousness, in which its reality is taken to be immediately naught, its actual performance thus becomes a doing of nothing at all; its enjoyment becomes a feeling of its own unhappiness. In consequence, activity and enjoyment lose all universal content and significance; for in that case they would have a substantiality of their own: and both withdraw into the state of particularity, to which consciousness is directed in order to cancel them. Consciousness discovers itself as this concrete particular in the functions of animal life. These latter, instead of being performed unconsciously and naturally as something which, *per se,* is of no significance, and can acquire no importance and essential value for spirit,-these latter, since it is in them that the enemy is seen in his proper and peculiar shape, are rather an object of strenuous concern and serious occupation, and become precisely the most important consideration. Since, however this enemy creates itself in its very defeat, consciousness, by giving the enemy a fixedness of being and of meaning, instead of getting rid of him, really never gets away from him and finds itself constantly defiled. And since, at the same time, this object of its exertions, instead of being something essential, is the very meanest, instead of being a universal, is the merest particular — we have here before us merely a personality confined within its narrow self and its petty activity, a personality brooding over itself, as unfortunate as it is pitiably destitute.

But all the same both of these, both the feeling of its misfortune and the poverty of its own action, are points of connection to which to attach the consciousness of its unity with the unchangeable. For the attempted immediate destruction of its actual existence is affected through the thought of the unchangeable and takes place in this relation to the unchangeable. The mediate relation constitutes the essence of the negative process, in which this consciousness directs itself against its particularity of being,

which, however, *qua* relation, is at the same time in itself positive, and will bring this its unity to light as an objective fact for this consciousness itself.

This mediate relation is consequently a connected inferential process (*Schluss*), in which particularity, establishing itself at first in opposition to the inherent essence, is bound together and united with this other term only through a third term. Through this middle term the one extreme, unchangeable consciousness, has a being for the unessential consciousness, in which, at the same time, is also involved that the latter likewise has a being for the former, solely through that middle term; and this middle term is thus one which presents both extremes to one another, and acts as the minister of each in turn in dealing with the other. This medium is itself a conscious being, for it is an action mediating consciousness as such; the content of this action is the destruction and annihilation, which consciousness has in view in dealing with its particularity.

In the middle term, then, this consciousness gets freed from action and enjoyment, in the sense of its own action and enjoyment. It puts away from itself, *qua* self-existent extreme, the substance of its will, and throws on to the mediating term, or the ministering agency, its own proper freedom of decision, and herewith the guilt of its own act. This mediator, being in direct communication with the unchangeable Being, renders service by advising what is just and right. The act, since this follows upon obedience to a deliverance enunciated by another, ceases, as regards the performance or the willing of the act, to be the agent's own proper deed. There is still left, however, to the subordinate consciousness, its objective aspect, namely, the fruit of its labour, and enjoyment. These, therefore, it casts away as well, and just as it disclaimed its own will, so it contemns such reality as it received in work and in enjoyment. It renounces these, partly as being the accomplished truth of its self-conscious independence, when it seeks to do something quite foreign to itself, thinking and speaking what, for it, has no

sense or meaning; partly, too, as being external property — when it demits somewhat of the possession acquired through its toil. It also gives up the enjoyment it had — when with its fastings and its mortifications it once more absolutely denies itself that enjoyment.

Through these moments — the negative abandonment first of its own right and power of decision, then of its property and enjoyment, and finally the positive moment of carrying on what it does not understand-it deprives itself, completely and in truth, of the consciousness of inner and outer freedom, or reality in the sense of its own existence for itself. It has the certainty of having in truth stripped itself of its Ego, and of having turned its immediate self-consciousness into a "thing", into an objective external existence.

It could ensure its self-renunciation and self-abandonment solely by this real and vital sacrifice [of its self]. For only thereby is the deception got rid of, which lies in inner acknowledgment of gratitude through heart, sentiment, and tongue — an acknowledgment which indeed disclaims all power of independent self-existence, and ascribes this power to a gift from above, but in this very disclaimer retains for itself its own proper and peculiar life, outwardly in the possession it does not resign, inwardly in the consciousness of the decision which itself has resolved upon and in the consciousness of its own self-constituted content, which it has not exchanged for a content coming from without and filling it with meaningless ideas and phrases.

But in the sacrifice actually accomplished. while consciousness has cancelled the action as its own act, it has also implicitly demitted and put off its unhappy condition. Yet that this demission *has* implicitly taken place, is effected by the other term of the logical process (*Schluss*)here involved, the term which is the inherent and ultimate reality, That sacrifice of the subordinate term, however, was at the same time not a onesided action; it

involves the action of the other. For giving up one's own will is only in one aspect negative; in principle, or in itself, it is at the same time positive, positing and affirming the will as an other,. and, specifically, affirming the will as *not* a particular but universal. This consciousness takes this positive significance of the negatively affirmed particular will to be the will of the other extreme, the will, which, because it is simply an "other" for consciousness, assumes the form of advice, or counsel, not through itself, but through the third term, the mediator. Hence its will certainly becomes, for consciousness, universal will, inherent and essential will, but is not itself in its own view this inherent reality. The giving up of its own will as particular is not taken by it to be in principle the positive element of universal will. Similarly its surrender of possession and enjoyment has merely the same negative significance, and the universal which it thereby comes to find is, in its view, not its own doing proper. This unity of objectivity and independent self-existence which lies in the notion of action, and which therefore comes for consciousness to be the essential reality and object — as this is not taken by consciousness to be the principle of its action, neither does it become an object for consciousness directly and through itself. Rather, it makes the mediating minister express this still halting certainty, that its unhappy state is only *implicitly* the reverse, i.e. is only *implicitly* action bringing self-satisfaction in its act or blessed enjoyment; that its pitiable action too is only *implicitly* the reverse, namely, absolute action; that in principle action is only really action when it is the action of some particular individual. But for its self, action and *its own* concrete action remain something miserable and insignificant, its enjoyment pain, and the sublation of these, positively considered, remains a mere "beyond". But in this object, where it finds its own action and existence, *qua* this particular consciousness, to be inherently existence and action as

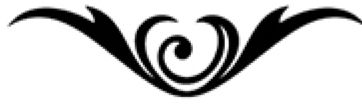
such, there has arisen the idea of Reason, of the certainty that consciousness is, in its particularity, inherently and essentially absolute, or is all reality.

C. Free Concrete Mind

Aa

Reason

Translator's comments: Reason is the first stage in the analysis of concrete self-conscious of itself in its object and conscious of the object as universal. Reason is not a mere "function" of mind, but a stage of mind. It therefore possesses its own peculiar content and operates in a process peculiar to itself. Its aim is to become completely conscious of its own nature; and to acquire this it must develop itself through its various phases. The process of development is from immediate to mediate, from what it is implicitly to what it is explicitly. The first step therefore is reason as immediate-where universal self is simply and directly *aware of* itself in the universal object. The operation of concrete mind at this stage is found where reason "observes". The analysis of observation as this operates in the various domain covered by the empirical sciences is thus the subject-matter of the following section. The processes of these various sciences are assumed in Hegel's analysis. Observation must change in character with the objects observed; hence the difference between observation of inorganic and organic nature, observation of mind, and of the relation of mind and nature. The difficulties reason has to face in this operation, and the contradictions into which it falls in seeking to find laws, etc., to satisfy its aim, form the substance of the following analysis.



The nature of reason as here conceived is the source and origin of philosophical Idealism, whether the idealism be one-sided or absolute.

Idealism is in fact the philosophical expression of the principle of reason, just as the various empirical sciences may be said to be the development, in the several ways which experience dictates, of the operation of rational observation. Hence the introductory pages of the following analysis are devoted to a statement of the character of true and false idealism.

The historical material behind the abstract argument elaborated here is provided by the awakened scientific spirit that appeared after the Reformation, and the methods and results of the empirical sciences at the time Hegel wrote. In particular the physiological conceptions of "irritability", "sensibility" and "reproduction", discussed on ff., were first formulated by Haller, *Elementa Physiologiae* (1757-66). For a list of the chief scientific works which appeared shortly before or about the time the following analysis was written, and which doubtless provided art of the material for the analysis, see Merz, *History of European Thought*, Vol. 1, p-83.

The polemical criticism which runs through this as through almost every section of the work is directed against the one-sided idealism of Hegel's predecessors and the imperfect conception of scientific method displayed by the current science of nature.

V. REASON'S CERTAINTY AND REASON'S TRUTH

WITH THE THOUGHT which consciousness has laid hold of, that the individual consciousness is inherently absolute reality, consciousness turns back into itself. In the case of the unhappy consciousness, the inherent and essential reality is a "beyond" remote from itself. But the process of its own activity has in its case brought out the truth that individuality, when completely developed, individuality which is a concrete actual mode of consciousness, is made the negative of itself, i.e. the objective extreme; — in other words, has forced it to make explicit its self-existence, and turned this into an objective fact. In this process it has itself become aware, too, of its unity with the universal, a unity which, seeing that the individual when sublated is the universal, is no longer looked on by us as falling outside it, and which, since consciousness maintains itself in this its negative condition, is inherently in it as such its very essence. Its truth is what appears in the process of synthesis — where the extremes were seen to be absolutely held apart — as the middle term, proclaiming to the unchangeable consciousness that the isolated individual has renounced itself, and to the individual consciousness that the unchangeable consciousness is no longer for it an extreme, but is one with it and reconciled to it. This mediating term is the unity directly aware of both, and relating them to one another; and the consciousness of their unity, which it proclaims to consciousness and thereby to itself, is the certainty and assurance of being all truth.

From the fact that self-consciousness is Reason, its hitherto negative attitude towards otherness turns round into a positive attitude. So far it has been concerned merely with its independence and freedom; it has sought to

save and keep itself for itself at the expense of the world or its own actuality, both of which appeared to it to involve the denial of its own essential nature. But *qua* reason, assured of itself, it is at peace so far as they are concerned, and is able to endure them; for it is certain its self is reality, certain that all concrete actuality is nothing else but it. Its thought is itself *eo ipso* concrete reality; its attitude towards the latter is thus that of *Idealism*. To it, looking at itself in this way, it seems as if now, for the first time, the world had come into being. Formerly, it did not understand the world, it desired the world and worked upon it; then withdrew itself from it and retired into itself, abolished the world so far as itself was concerned, and abolished itself *qua* consciousness — both the consciousness of that world as essentially real, as well as the consciousness of its nothingness and unreality. Here, for the first time, after the grave of its truth is lost, after the annihilation of its concrete actuality is itself done away with, and the individuality of consciousness is seen to be in itself absolute reality, it discovers the world as its own new and real world, which in its permanence possesses an interest for it, just as previously the interest lay only in its transitoriness. The subsistence of the world is taken to mean the actual presence of its own truth; it is certain of finding only itself there.

Reason is the conscious certainty of being all reality. This is how Idealism expresses the principle of Reason. Just as consciousness assuming the form of reason immediately and inherently contains that certainty within it, in the same way idealism also directly proclaims and expresses that certainty. I am I in the sense that the I which is object for me is sole and only object, is all reality and all that is present. The I which is object to me here is not what we have in self-consciousness in general, nor again what we have in free independent self-consciousness; in the former it is merely empty object in general, in the latter, it is merely all object that withdraws itself from other objects that still hold their own alongside it. In the present

instance, the object-ego is object which is consciously known to exclude the existence of any other whatsoever. Self-consciousness, however, is not merely from its own point of view (*für sich*), but also in its very self (*an sich*) all reality, primarily by the fact that it becomes this reality, or rather demonstrates itself to be such. It demonstrates itself to be this by the way in which first in the course of the dialectic movement of "meaning" (*Meinen*), perceiving, and understanding, otherness disappears as implicitly real (*an sich*); and then in the movement through the independence of consciousness in Lordship and Servitude. through the idea of freedom, sceptical detachment, and the struggle for absolute liberation on the part of the self-divided consciousness, otherness, in so far as it is only subjectively for self-consciousness, vanishes for the latter itself. There appeared two aspects, one after the other; the one where the essential reality or the truly real had for consciousness the character of (objective) existence, the other where it had the character of only being (subjectively) for consciousness. But both were reduced to one single truth, that what is or the real *per se* (*an sich*) only is so far as it is an object for consciousness, and that what is for consciousness is also objectively real. The consciousness, which is this truth, has forgotten the process by which this result has been reached; the pathway thereto lies behind it. This consciousness comes on the scene directly in the form of reason; in other words, this reason, appearing thus immediately, comes before us merely as the *certainty* of that truth. It merely gives the assurance of being all reality; it does not, however, itself *comprehend* this fact; for that forgotten pathway by which it arrives at this position is the process of comprehending what is involved in this mere assertion which it makes. And just on that account any one who has not taken this route finds the assertion unintelligible, when he hears it expressed in this abstract form although as a matter of concrete experience he makes indeed the same assertion himself.

The kind of Idealism which does not trace the path to that result, but starts off with the bare assertion of this truth, is consequently a mere assurance, which does not understand its own nature, and cannot make itself intelligible to any one else. It announces an intuitive certainty, to which there stand in contrast other equally intuitive certainties that have been lost just along that very pathway. Hence the assurances of these other certainties are equally entitled to a place alongside the assurance of that certainty. Reason appeals to the self-consciousness of each individual consciousness: I am I, my object and my essential reality is ego; and no one will deny reason this truth. But since it rests on this appeal, it sanctions the truth of the other certainty, viz. there is for me an other; an other than "I" is to me object and true reality: or in that I am object and reality to myself, I am only so by my withdrawing myself from the other altogether and appearing alongside it as an actuality.

Only when reason comes forward as a reflexion from this opposite certainty does its assertion regarding itself appear in the form not merely of a certainty and an assurance but of a truth — and a truth not alongside others, but the only truth. Its appearing directly and immediately is the abstract form of its actual presence, the essential nature and inherent reality of which is an absolute notion, i.e. the process of its own development.

Consciousness will determine its relation to otherness or its object in various ways according as it is at one or other stage in the development of the world-spirit into self-consciousness. How the world-spirit immediately finds and determines itself and its object at any given time, or how it appears to itself, depends on what it has already come to be, or on what it already implicitly and inherently is.

Reason is the certainty of being all reality. This its inherent nature, this reality, is still, however, through and through a universal, the pure abstraction of reality. It is the first positive character which self-

consciousness *per se* is aware of being, and ego is, therefore, merely the pure, inner essence of existence, in other words, is the *Category* bare and simple. The category, which heretofore had the significance of being the inmost essence of existence — of existence indifferent to whether it is existence at all, or existence over against consciousness — is now the essential nature or simple unity of existence merely in the sense of a reality that thinks. To put it otherwise, the category means this, that existence and self-consciousness are the same being, the same not as a matter of comparison, but really and truly in and for themselves. It is only a onesided, unsound idealism which lets this unity again appear on one side as consciousness, with a reality *per se* over against it on the other.

But now this category, or simple unity of self-consciousness and being, has difference within it; for its very nature consists just in this — in being immediately one and identical with itself in otherness or in absolute difference. Difference therefore is, but completely transparent, a difference that is at the same time none. It appears in the form of a *plurality* of categories. Since idealism pronounces the simple unity of self-consciousness to be all reality, and makes it straightway the essentially real without first having comprehended its absolutely negative nature — only an absolutely negative reality contains within its very being negation, determinateness, or difference — still more incomprehensible is this second position, viz. that in the category there are differences, kinds or species of categories. This assurance in general, as also the assurance as to any determinate number of kinds of categories, is a new assurance, which, however, itself implies that we need no longer accept it as an assurance. For since difference starts in the pure ego, in pure understanding itself, it is thereby affirmed that here immediacy, making assurances, finding something given, must be abandoned and reflective comprehension begin. But to pick up the various categories again in any sort of way as a kind of

happy find, hit upon, e.g. in the different judgments, and then to be content so to accept them, must really be regarded as an outrage on scientific thinking. Where is understanding to be able to demonstrate necessity, if it is incapable of so doing in its own case, itself being pure necessity?

Now because, in this way, the pure essential being of things, as well as their aspect of difference, belongs to reason, we can, strictly speaking, no longer talk of things at all, i.e. of something which would only be present to consciousness by negatively opposing it. For the many categories are species of the pure category, which means that the pure category is still their genus or essential nature, and not opposed to them. But they are indeed that ambiguous being which contains otherness too, as opposed to the pure category in its plurality. They, in point of fact, contradict the pure category by this plurality, and the pure category must sublate them in itself, a process by which it constitutes itself the negative unity of the different elements. *Qua* negative unity, however, it puts away from itself and excludes both the diverse elements as such, and that previous immediate unity as such; it is then individual singleness — a new category, which is an exclusive form of consciousness, i.e. stands in relation to something else, an other. This individuality is its transition from its notion to an external reality, the pure "schema", which is at once a consciousness, and in consequence of its being a single individual and an excluding unit, points to the presence of an external other. But the "other" of this category is merely the "other" categories first mentioned, viz. pure essential reality and pure difference; and in this category, i.e. just in affirming the other, or in this other itself, consciousness is likewise itself too. Each of these various moments points and refers to an other; at the same time, however, they do not involve any absolute otherness. The pure category refers to the species, which pass over into the negative category, the category of exclusion, individuality; this latter, however, points back to them, it is itself pure consciousness, which is

aware in each of them of being always this clear unity with itself — a unity, however, that in the same way is referred to an other, which in being disappears, and in disappearing is once again brought into being.

We see pure consciousness here affirmed in a twofold form. In one case it is the restless activity which passes hither and thither through all its moments, seeing in them that otherness which is sublated in the process of grasping it; in the other case it is the imperturbable unity certain of its own truth. That restless activity constitutes the "other" for this unity, while this unity is the "other for that activity; and within these reciprocally determining opposites consciousness and object alternate. Consciousness thus at one time finds itself seeking about hither and thither, and its object is what absolutely exists *per se*, and is the essentially real; at another time consciousness is aware of being the category bare and simple, and the object is the movement of the different elements. Consciousness, however, *qua* essential reality, is the whole of this process of passing out of itself *qua* simple category into individuality and the object, and of viewing this process in the object, cancelling it as distinct, appropriating it as its own, and declaring itself as this certainty of being all reality, of being both itself and its object.

Its first declaration is merely this abstract, empty phrase that everything is its own. For the certainty of being all reality is to begin with the pure category. Reason knowing itself in this sense in its object is what finds expression in abstract empty idealism; it merely takes reason as reason appears at first, and by its pointing out that in all being there is this bare consciousness of a "mine", and by expressing things as sensations or ideas, it fancies it has shown that abstract mine" of consciousness to be complete reality. It is bound, therefore, to be at the same time absolute Empiricism, because, for the filling of this empty "mine", i.e. for the element of distinction and all the further development and embodiment of it, its reason

needs an impact (*Anstoss*) operating from without, in which lies the *fons et origo* of the multiplicity of sensations or ideas. This kind of idealism is thus just such a self-contradictory equivocation as scepticism, only, while the latter expresses itself negatively, the former does so in a positive way. But it fails just as completely as scepticism to link up its contradictory statements about pure consciousness being all reality, while all the time the alien impact, or sense-impressions and ideas, are equally reality. It oscillates hither and thither from one to the other and tumbles into the false, or the sensuous, infinite. Since reason is all reality in the sense of the abstract "mine", and the "other" is an externality indifferent to it, there is here affirmed just that sort of knowledge of an "other" on the part of reason, which we met with before in the form of "intending" or meaning" (*Meinen*), "perceiving", and "understanding", which grasps what is "meant" and what is "perceived". Such a kind of knowledge is at the same time asserted by the very principle of this idealism itself not to be true knowledge; for only the unity of apperception is the real truth of knowledge. Pure reason as conceived by this idealism, if it is to get at this "other" which is essential to it, i.e. really is *per se*, but which it does not possess in itself — is thus thrown back on that knowledge which is not a knowledge of the real truth. It thus condemns itself knowingly and voluntarily to being an untrue kind of knowledge, and cannot get away from "meaning" and "perceiving", which for it have no truth at all. It falls into a direct contradiction; it asserts that the real has a twofold nature, consists of elements in sheer opposition, is the unity of apperception and a "thing" as well; whether a thing is called an alien impact, or an empirical entity, or sensibility, or the "thing in itself", it remains in principle precisely the same, viz. something external and foreign to that unity.

This idealism falls into such a contradiction because it asserts the abstract notion of reason to be the truth. Consequently reality comes

directly before it just as much in a form which is not strictly the reality of reason at all, whereas reason all the while is intended to be all reality. Reason remains, in this case, a restless search, which in its very process of seeking declares that it is utterly impossible to have the satisfaction of finding. But actual concrete reason is not so inconsequent as this. Being at first merely the certainty that it is all reality, it is in this notion well aware that *qua* certainty *qua* ego it is not yet in truth all reality; and thus reason is driven on to raise its formal certainty into actual truth, and give concrete filling to the empty "mine".

A

Observation as a Process of Reason

THIS consciousness, which takes being to mean what is its *own*, now seems, indeed, to adopt once again the attitude of "meaning" and "perceiving"; but not in the sense that it is certain of what is a mere "other", but in the sense that it is certain of this "other" being itself. Formerly, consciousness merely happened to perceive various elements in the "thing", and had a certain experience in so doing. But here it itself settles the observations to be made and the experience to be had. "Meaning" and "perceiving", which formerly were superseded so far as *we* were concerned (*für uns*), are now superseded by consciousness in its own behalf (*für es*). Reason sets out to know the truth, to find in the form of a notion what, for "meaning" and "perceiving", is a "thing"; i.e. it seeks in thinghood to have merely the consciousness of its own self. Reason has, therefore, now a universal interest in the world, because it is certain of its presence in the world, or is certain that the actual present is rational. It seeks its "other", while knowing that it there possesses nothing else but itself: it seeks merely its own infinitude.

While, at first, merely surmising that it is in the world of reality, or knowing this only in a general way to be its own, it goes forward on this understanding and appropriates everywhere and at all points its own assured possession. It plants the symbol of its sovereignty on the heights and in the depths of reality. But this superficial "mine" is not its final and supreme interest. The joy of universal appropriation finds still in its property the alien other which abstract reason does not contain within itself. Reason has the presentiment of being a deeper reality than pure ego is, and must demand that difference, the manifold diversity of being, should itself become its very own, that the ego should look at and see itself as concrete reality, and find itself present in objectively embodied form and in the shape of a "thing". But if reason probes and gropes through the inmost recesses of the life of things, and opens their every vein so that reason itself may gush out of them, then it will not achieve this desired result; it must, for its purpose, have first brought about in itself its own completion in order to be able after that to experience what its completion means.

Consciousness "observes", i.e. reason wants to find and to have itself in the form of existent object, to be, in concrete sensuously-present form. The consciousness thus observing fancies (*meint*), and, indeed, says that it wants to discover not itself, but, on the contrary, the inner being of things *qua* things. That this consciousness "means" this and says so, lies in the fact that it is reason, but reason as such is for it not as yet object.

If it were to know reason to be equally and at once the essence of things and of itself, and knew that reason can only be actually present in consciousness in the form and shape peculiarly appropriate to reason, then it would descend into the depths of its own being, and seek reason there rather than in things. If it had found reason there, it would again turn from that and be directed upon concrete reality, in order to see therein its own sensuous

expression, but would, at the same time, take that sensuous form to be essentially a notion.

Reason, as it immediately appears in the form of conscious certainty of being all reality, takes its reality in the sense of immediacy of being, and also takes the unity of ego with this objective existence in the sense of an immediate unity, a unity in which it (reason) has not yet separated and then again united the moment of being and ego, or, in other words, a unity which reason has not yet come to understand. It, therefore, when appearing as conscious observation, turns to things with the idea that it is really taking them as sensuous things opposed to the ego. But its actual procedure contradicts this idea, for it knows things, it transforms their sensuous character into conceptions, i.e. just into a kind of being which at the same time is ego; it transforms thought into an existent thought, or being into a thought-constituted being, and, in fact, asserts that things have truth merely as conceptions. In this process, it is only what the things are that consciousness in observation becomes aware of; we, however [who are tracing the nature of this experience], become aware of what conscious observation itself is. The outcome of its process, however, will be that this consciousness becomes aware of being for itself what it is in itself [i.e. becomes aware of being to itself what, in the meantime, it is to us].

We have to consider the operation of this observational phase of reason in all the various moments of its activity. It takes up this attitude towards Nature, Mind, and finally towards the relation of both in the form of sense-existence; and in all these it seeks to find itself as a definitely existing concrete actuality.

a

Observation of Nature

WHEN the unreflective consciousness speaks of observation and experience as being the fountain of truth, the phrase may possibly sound as if the whole business were a matter of tasting, smelling, feeling, hearing, and seeing. It forgets, in its zeal for tasting, smelling, etc., to say that, in point of fact, it has really and rationally determined for itself already the object thus sensuously apprehended, and this determination of the object is at least as important for it as that apprehension. It will also as readily admit that its whole concern is not simply a matter of perceiving, and will not allow, e.g. the perception that this penknife lies beside this snuff-box to pass for an "observation". What is perceived should, at least, have the significance of a universal, and not of a sensuous particular "this".

The universal, here regarded, is, only in the first instance, what remains identical with itself; its movement is merely the uniform recurrence of the same operation. The consciousness, which thus far finds in the object merely universality or the abstract "mine", must take upon itself the movement peculiar to the object; and, since it is not yet at the stage of understanding that object, it must, at least, be the recollection of it, a recollection which expresses in a universal way what, in actual fact, is merely present in a particular form. This superficial way of educing from particularity, and the equally superficial form of universality into which the sense element is merely taken up, without the sense element having in itself become a universal — this description of things is not as yet a process effected in the object itself. The process really takes place solely in the function of *describing*. The object as it is described has consequently lost interest, when one object is being described another must be taken in hand and ever sought, so as not to put a stop to the process of description. If it is no longer easy to find new and whole things, then there is nothing for it but to turn back upon those already found, in order to divide them still further, break them up into component parts and look out for any new aspects of

thinghood that still remain in them. There can never be an end to the material at the disposal of this restlessly active instinct. To find a new genus of distinctive significance, or even to discover a new planet, which although an individual entity yet possesses the nature of a universal, can only fall to the lot of those who are lucky enough. But the boundary line of what, like elephant, oak, gold, is markedly distinctive, the line of demarcation of what is genus and species passes through many stages into the endless particularization of the chaos of plants and animals, kinds of rocks, or of metals, forms of earth, etc., etc., that only force and craft can bring to light. In this realm where universality means indeterminateness, where particularity now approximates to singleness, and again at this point and that even descends to it entirely, there is offered an inexhaustible supply of material for observation and description to deal with. Here, where a boundless field is opened up, at the boundary line of the universal it can have found not an immeasurable wealth, but instead, merely the limitations of nature and of its own operation. It can no longer know whether what seems to have being *per se* is not a chance accident. What bears the impress of a confused or immature feeble structure, barely evolving from the stage of elementary indeterminateness, cannot claim even to be described.

While this seeking and describing seem to be concerned merely with things, we see that in point of fact it does not continue in the form of sense-perception. Rather, what enables things to be known is more important for description than the range of sense properties still left over, qualities which, of course, the thing itself cannot do without, but which consciousness dispenses with. Through this distinction into what is essential and what is unessential, the notion rises out of the dispersion of sensibility, and knowledge thereby makes it clear that it has to do at least quite as essentially with its own self as with things. This twofold essentiality produces a certain hesitation as to whether what is essential and necessary

for knowledge is also so in the case of the things. On the one hand, the qualifying "marks" have merely to serve the purpose of knowledge in distinguishing things *inter se*; on the other hand, however, it is not the unessential quality of things that has to be known, but that feature in virtue of which they themselves break away from the general continuity of being as a whole, separate themselves from others and stand by themselves. The distinguishing "marks" must not only have an essential relation to knowledge but also be the essential characteristics of the things, and the system of marks devised must conform to the system of nature itself, and merely express this system. This follows necessarily from the very principle and meaning of reason; and the instinct of reason — for it operates in this process of observation merely as an instinct — has also in its systems attained this unity, a unity where its objects are so constituted that they carry their own essential reality with them, involve an existence on their own account, and are not simply an incident of a given particular time, or a particular place. The distinguishing marks of animals, for example, are taken from their claws and teeth; for, in point of fact, not only does knowledge distinguish thus one animal from another, but each animal *itself* separates itself off thereby; it preserves itself independently by means of these weapons, and keeps itself detached from the universal nature. A plant, on the other hand, never gets the length of existing for itself; it touches merely the boundary line of individuality. This line is where plants show the semblance of diremption and separation by the possession of different sex-characters; this furnishes, therefore, the principle for distinguishing plants *inter se*. What, however, stands on a still lower level cannot of itself any longer distinguish itself from another; it gets lost when the contrast comes into play. Quiescent being and being in a relation come into conflict with one another; a "thing" in the latter case is something different from a "thing" in the former state; whereas the "individuum" consists in preserving

itself in relation to another. What, however, is incapable of this and becomes in chemical fashion something other than it is empirically, confuses knowledge and gives rise to the same doubt as to whether knowledge is to hold to the one side or the other, since the thing has itself no self-consistency, and these two sides fall apart within it.

In those systems where the elements involve general self-sameness, this character connotes at once the self-sameness of knowledge and of things themselves as well. But this expansion of these self-identical characteristics, each of which describes undisturbed the entire circuit of its course and gets full scope to do as it likes, necessarily leads as readily to its very opposite, leads to the confusion of these characteristics. For the qualifying mark, the general characteristic is the unity of opposite factors, viz. of what is determinate, and of what is *per se* universal. It must, therefore, break asunder into this opposition. If, now, on one side the characteristic overmasters the universality in which its essence lies, on the other side, again, this universality equally keeps that characteristic under control, forces the latter on to its boundary line, and there mingles together its distinctions and its essential constituents. Observation which kept them apart in orderly fashion, and thought it had hold there of something stable and fixed, finds the principles overlapping and dominating one another, sees confusions formed and transitions made from one to another; here it finds united what it took at first to be absolutely separated, and there separated what it considered connected. Hence, when observation thus holds by the unbroken self-sameness of being, it has here, just in the most general determinations given — e.g. in the case of the essential marks of an animal or a plant-to see itself tormented with instances, which rob it of every determination, silence the universality it reached, and reduce it again to unreflective observation and description.

Observation, which confines itself in this way to what is simple, or restricts the sensuously dispersed elements by the universal, thus finds its principle confused by its object, because what is determined must by its very nature get lost in its opposite. Reason, therefore, must pass from that inert characteristic which had the semblance of stability, and go on to observe it as it really is in truth, viz. as relating itself to its opposite. What are called essential marks are passive characteristics, which, when expressed and apprehended as simple, do not bring out what constitutes their real nature — which is to be vanishing moments of its process of withdrawing and betaking itself into itself. Since the instinct of reason now arrives at the point of looking for the characteristic in the light of its true nature — that of essentially passing over into its opposite and not existing apart by itself and for its own sake — it seeks after the *Law* and the notion of law. It seeks for them, moreover, as existing reality; but this feature of concrete reality will in point of fact disappear before reason, and the aspects of the law will become for it mere moments or abstractions, so that the law comes to light in the nature of the notion, which has destroyed within itself the indifferent subsistence of sensuous reality.

To the consciousness observing, the truth of the law is given in "experience", in the way that sense existence is object for consciousness; the truth is not given in and itself. If, however, the law does not have its truth for in the notion, it is something contingent, not a necessity, in fact, not a law. But its being essentially in the form of a notion does not merely not contradict its being present for observation to deal with, but really gives it on that account necessary existence, and makes it an object for observation. The universal in the sense of a rational universality is also universal in the sense implied in the above notion: its being is *for* consciousness, it presents itself there as the real, the objective present; the notion sets itself forth in the form of thinghood and sensuous existence. But

it does not, on that account, lose its nature and fall into the condition of immovable subsisting passivity, or mere adventitious (*gleichgültig*) succession. What is universally valid is also universally effective: what *ought to be*, as a matter of fact, *is* too; and what merely *should* be, and is *not*, has no real truth. The instinct of reason is entirely within its rights when it stands firm on this point, and refuses to be led astray by *entia intellectus* which merely *ought* to be and, *qua* ought, should be allowed to have truth even though they are to be met with nowhere in experience; and declines to be turned aside by the hypothetical suggestions and all the other impalpable unrealities designed in the interest of an everlasting "ought to be" which never *is*. For reason is just this certainty of having reality; and what consciousness is not aware of as a real self (*Selbstwesen*), i.e. what does not appear, is nothing for consciousness at all.

The true nature of law, viz.: that it essentially is reality, no doubt again assumes for consciousness which remains at the level of observation, the form of an opposite over against the notion and the inherently universal; in other words, this consciousness does not take such an object as its law to be a reality of reason; it thinks it has got there something external and foreign. But it contradicts its own idea by actually and in fact not taking its universality to mean that all individual things of sense must have given evidence of the law to enable the truth of the law to be asserted. The assertion that stones, when raised from the ground and lot go, fall, does not at all require us to make the experiment with all stones. It means most likely that this experiment must have been tried at least with a good many, and from that we can by analogy draw an inference about the rest with the greatest probability or with perfect right. Yet analogy not only gives no perfect right, but, on account of its nature, contradicts itself so often that the inference to be drawn from analogy itself rather is that analogy does not permit an inference to be drawn. Probability, which is what analogy would

come to, loses, when face to face with truth, every distinction of less and greater; be the probability as great as it may it is nothing as against truth. The instinct of reason, however, takes, as a matter of fact, laws of that sort for truth. It is when reason does not find necessity in them that it resorts to making this distinction, and lowers the truth of the matter to the level of probability, in order to bring out the imperfect way in which truth is presented to the consciousness that as yet has no insight into the pure notion; for universality is before it there merely in the form of simple immediate universality. But, at the same time, on account of this universality, the law has truth for consciousness. That a stone falls is true for consciousness, because it is aware of the stone being heavy, i.e. because in weight, taken by itself as such, the stone has that essential relation to the earth expressed in the fact of falling. Consciousness thus finds in experience the objective being of the law, but has it there in the form of a notion as well; and only because of both factors together is the law true for consciousness. The law, therefore, is accepted as a law because it presents itself in the sphere of appearance and is, at the same time, in its very nature a notion.

The instinct of reason in this type of consciousness, because the law is at the same time inherently a notion, proceeds to give the law and its moments a purely conceptual form; and proceeds to do this of necessity, but without knowing that this is what it seeks to do. It puts the law to the test of experiment. As the law first appears, it is enveloped in particulars of sense, and the notion constituting its nature is involved with empirical elements. The instinct of reason sets to work to find out by experiment what follows in such and such circumstances. By so doing the law seems only to be plunged still further into sense; but sense existence really gets lost in the process. The inner purport of this investigation is to find pure conditions of the law; and this means nothing else (even if the consciousness stating the

fact were to think it meant something different) than completely to bring out the law in conceptual shape and detach its moments entirely from determinate specific existence. For example, negative electricity, which is known at first, say, in the form of resin-electricity, while positive electricity comes before us as glass-electricity — these, by means of experiments, lose altogether such a significance, and become purely positive and negative electricity, neither of which is bound up any longer with things of a particular kind; and we can no longer say that there are bodies which are electrical positively, others electrical negatively. In the same way the relationship of acid and base and their reaction constitute a law in which these opposite factors appear as bodies. Yet these sundered things have no reality; the power which tears them apart cannot prevent them from entering forthwith into a process; for they are merely this relation. They cannot subsist and be indicated by themselves apart, like a tooth or a claw. That it is their very nature to pass over directly into a neutral product makes their existence lie in being cancelled and superseded, or makes it into a universal; and acid and base possess truth merely *qua* Universal. Just, then, as glass and resin can be equally well positively as negatively electrified, in the same way acid and base are not attached as properties or qualities to this or that reality; each thing is only relatively acidulate and basic; what seems to be an absolute base or an absolute acid gets in the so-called Synsomates the opposite significance in relation to an other.

The result of the experiments is in this way to cancel the moments or inner significations as properties of specific things, and free the, predicates from their subjects. These predicates are found merely as universal, and in truth that is what they are. Because of this self subsistence they therefore get the name of kinds of “matter”, which is neither a body nor a property of a body; certainly no one would call acid, positive and negative electricity, heat, etc., bodies.

Matter, on the contrary, is not a thing that exists, it is being in the sense of universal being, or being in the way the concept is being. Reason, still instinctive, correctly draws this distinction without being conscious that it (reason), by the very fact of its testing the law in every sense-particular, cancels the merely sensuous existence of the law; and, when it construes the moments of the law as forms of matter, their essential nature is taken to be something universal, and specifically expressed as a non-sensuous element of sense, an incorporeal and yet objective existence.

We have now to see what turn its result takes, and what new shape this activity of observation will, in consequence, assume. As the outcome and truth of this experimentation we find *pure law,* which is freed from sensuous elements; we see it as a concept, which, while present in sense, operates there independently and unrestrained, while enveloped in sense, is detached from it and is a concept bare and simple. This, which is in truth result and essence, now comes before this consciousness itself, but as an object; moreover, since the object is not exactly a result for it and is unrelated to the preceding process, the object is a specific kind of object, and the relation of consciousness to it takes the form of another kind of observation.

a

Observation of Organic Nature

Such an object which sustains the procedure in the simple activity of the notion is an organism.

Organic existence is this absolutely fluid condition wherein determinateness, which would only put it in relation to an other, is dissolved. Inorganic things involve determinateness in their very essence; and on that account a thing realizes the completeness of the moments of the

notion only along with another thing, and hence gets lost when it enters the dialectic movement. In the case of an organic being, on the other hand, all determinate characteristics, by means of which it is palpable to another, are held under the control of the simple organic unity; none of them comes forward as essential and capable of detaching itself from the rest and relating itself to an other being. What is organic, therefore, preserves itself in its very relation.

The aspects of law on which the instinct of reason directs its observation here are, as we see from the above, in the first instance organic nature and inorganic nature in their relation to one another. The latter means for organic nature just the free play-a freedom opposed to the simple notion of organic nature — loosely connected characteristics in which individuated nature is at once dissolved, and out of the continuity of which the individuated unit of nature at the same time breaks away and exists separately. Air, water, earth, zones and climate are universal elements of this sort, which make up the indeterminate simple being of natural individualities, and in which these are at the same time reflected into themselves. Neither the individuality nor the natural element is absolutely self-contained. On the contrary: in the independent detachment, which observation finds these assuming towards one another, they stand at the same time in essential relation to one another, but in such a way that their independence and mutual indifference form the predominating feature, and only in part become abstractions. Here, then, law appears as the relation of an element to the formative process of the organic being, which at one moment has the element over against itself, at another exhibits it within its own self-determining organic structure. But laws like these: animals belonging to the air are of the nature of birds, those belonging to water have the constitution of fish, animals in northerly latitudes have thick coats of hair, and so on-such laws exhibit a degree of poverty which does not do

justice to the manifold variety of organic nature. Besides the fact that the free activity of organic nature can readily divest its forms of determinate characters like theses and everywhere presents of necessity exceptions to such laws or rules, as we might call them; the characterization of those very animals to which they do apply is so very superficial that even the necessity of the "laws" can be nothing else but superficial too, and does not carry us further than what is implied in speaking of the "great influence" of environment on the organism. And this does not tell us what properly is due to that influence and what is not. Such like relations of organic beings to the elements they live in cannot therefore be strictly called laws at all. For, on the one hand, such a relation, when we look at its content, does not exhaust, as we saw, the range of the organic beings considered, and on the other, the terms of the relation itself stand indifferently apart from one another and express no necessity. In the concept of an acid lies the notion of a base, just as the notion of positive electricity implies that of negative; but even though we do find as a fact a thick coat of hair associated with northerly latitudes, the structure of a fish with water, or that of birds with air, there is nothing in the notion of the north implying the notion of a thick covering of hair, the notion of the structure of fish does not lie in the notion of the sea, nor that of birds in that of the air. Because of this free detachment of the two notions from one another there *are*, as a fact also land animals with the essential characters of a bird, of fish, and so on. The necessity, just because it cannot be conceived to be an inner necessity of the object, ceases also to have a foothold in sense, and can be no longer observed in actual reality, but has quitted the sphere of reality. Finding thus no place in the real object itself, it becomes what is called a "teleological relation", a relation which *is external* to what is related, and consequently the very reverse of a law of its constitution. It is an idea entirely detached from the necessity of nature, a

thought which leaves this necessity of nature behind and floats above it all by itself.

If the relation, above alluded to, of organic existence to the elemental conditions of nature does not express its true being, the notion of Purpose, on the other hand, does contain it. The observing attitude does not indeed take the to be the genuine essence of organic existence; this notion seems to it to fall outside the real nature of the organism, and is then merely that external teleological relation above mentioned. Yet looking at how the organic being was previously characterized, the organic is in point of fact just realized concrete purpose. For since *itself* maintains *itself* in relation to another, it is just that kind of natural existence in which nature reflects itself into the notion, and the moments of necessity separated out [by Understanding]-a cause and an effect, an active and a passive-are here brought together and combined into a single unity. In this way we have here not only something appearing as a *result* of necessity, but, because it has returned to itself, the last or the result is just as much the first which starts the process, and is to itself the purpose which it realizes. What is organic does not produce something, it merely conserves itself, or what is produced is as much there already as produced.

We must elucidate this principle more fully, both as it is in itself and as it is for the instinct of reason, in order to see how reason finds itself there, but does not know itself in what it finds. The concept of purpose, then, which rational observation has reached, is, while reason has apprehended it in consciousness, given to reason as something actually real as well; it is not merely an external relation of the actual, but its inner being. This actual, which is itself a purpose, is related purposively to an other, i.e. its relation is a contingent one with respect to what both are immediately; *prima facie* they are both self-subsistent and indifferent to one another. The real nature of their relation, however, is something different from what they thus

appear to be, and its effect has another meaning than sense-perception directly finds. The necessity inherent in the process is concealed, and comes out at the end, but in such a way that this very end shows it to have been also the first. The end, however, shows this priority of itself by the fact that nothing comes out of the alteration the act produced, but what was there already. Or, again, if we start from what is first, this, in coming to the end or the result of its act, merely returns to itself, and, just by so doing, it demonstrates itself to be that which has itself as its end, that is to say, *qua* first it has already returned to itself, or is self-contained, is in and for itself. What, then, it arrives at by the process of its action is itself; and its arriving merely at itself means feeling itself, is its self-feeling. Thus we have here, no doubt, the distinction between what it is and what it seeks; but this is merely the semblance of a distinction, and consequently it is a notion in its very nature.

This is exactly, however, the way self-consciousness is constituted. It distinguishes itself in like manner from itself, without any distinction being thereby established. Hence it is that it finds in observation of organic nature nothing else than this kind of reality; it finds itself in the form of a thing, as a *life*, and yet, between what it is itself and what it has found, draws a distinction which is, however, no distinction. Just as the instinct of an animal is to seek and consume food, but thereby elicits nothing except itself; similarly too the instinct of reason in its search merely finds reason itself. An animal ends with self-feeling. The instinct of reason, on the other hand, is at the same time, *self-consciousness*. But because it is merely instinct, it is put on one side as against consciousness, and in the latter finds its opposite. Its satisfaction is, therefore, broken in two by this opposite; it finds itself, viz. the purpose, and also finds this purpose in the shape of a thing. But the purpose is seen to lie, in the first instance, apart from the thing presenting itself as a purpose. In the second place, this purpose *qua*

purpose is at the same time objective; it is taken to fall, there. fore, not within the observing consciousness, but within another intelligence.

Looked at more closely, this character lies also just as much in the notion of the thing — that of being in itself purpose. It preserves itself; this means at one and the same time it is its nature to conceal the controlling necessity and to present that necessity in the form of a contingent relation. For its freedom, its being on its own account, means just that it behaves towards its necessary condition as something indifferent. It thus presents itself as if it were something whose notion falls apart from its existence. In this way reason is compelled to look on its own proper notion as falling outside it, to look at it as a thing, as that towards which it is indifferent, and which in consequence is reciprocally indifferent towards it [reason] and towards its own notion. *Qua* instinct it continues to remain within this state of being, this condition of indifference; and the thing expressing the notion remains for it something other than this notion, and the notion other than the thing. Thus for reason the thing organized is only *per se* a purpose in the sense that the necessity, which is presented as concealed within the action of the thing — for the active agency there takes up the attitude of being indifferent and independent — falls outside the organism itself.

Since, however, the organic *qua* purpose *per se* can not behave in any other way than as organic, the fact of its being *per se* a purpose is also apparent and sensibly present, and as such it is observed. What is organic shows itself when observed to be something self-preserving, returning and returned into itself. But in this state of being, observation does not recognize the concept of purpose, or does not know that the notion of purpose is not in an intelligence anywhere else, but just exists here and in the form of a thing. Observation makes a distinction between the concept of purpose and self-existence and self-preservation, which is not a distinction at all. That it is no distinction is something of which it is not aware; what it

is aware of is an activity which appears contingent and indifferent towards what is brought about by that activity, and towards the unity which is all the while the principle connecting both; that activity and this purpose are taken to fall asunder.

On this view the special function of the organic is the inner operating activity lying between its first and last stage, so far as this activity implies the character of singleness. So far, however, as the activity has the character of universality, and the active agent is equated with what is the outcome of its operation, this purposive activity as such would not belong to organic beings. That single activity, which is merely a means, comes, owing to its individual form, to be determined by an entirely individual or contingent necessity. What an organic being does for the preservation of itself as an individual, or of itself *qua* genus, is, therefore, quite lawless as regards this immediate content: for notion and universal fall outside it. Its activity would accordingly be empty functioning without any content in it; it would not even be the functioning of a machine, for this has a purpose and its activity in consequence a definite content. If it were deserted in this way by the universal, it would be an activity of a mere being *qua* being, i.e. would be an activity like that of an acid or a base, not forthwith reflected into itself-a function which could not be cut off from its immediate existence, nor give up this existence (which gets lost in the relation to its opposite), but could preserve itself. The kind of being whose functioning is here under consideration is, however, set down as a thing preserving itself in its relation to its opposite. The activity as such is nothing but the bare insubstantial form of its independent existence on its own account; and the purpose of the activity, its substances — substance, which is not simply a determinate being, but the universal-does not fall outside the activity. It is an activity reverting into itself by its own nature, and is not turned back into itself by any alien, external agency.

This union of universality and activity, however, is not a matter for this attitude of observation, because that unity is essentially the inner movement of what is organic, and can only be apprehended conceptually. Observation, however, seeks the moments in the form of existence and duration; and because the organic whole consists essentially in not containing the moments in that form, and in not letting them be found within it in that way, this observing consciousness, by its way of looking at the matter, transforms the opposition into one which conforms and is adapted to its own point of view.

An organism comes before the observing consciousness in this manner as a relation of two fixed and existing moments — as a relation of elements in an opposition, whose two factors seem in one respect really given in observation, while in another respect, as regards their content, they express the opposition of the organic concept of purpose and actual reality. But because the notion as such is there effaced, this takes place in an obscure and superficial way, where thought sinks to the level of mere ideal presentation. Thus we see the notion taken much in the sense of what is inner, reality in the sense of what is outer; and their relation gives rise to the law that "the outer is the expression of the inner".

Let us consider more closely this inner with its opposite and their relation to one another. In the first place we find that the two factors of the law no longer have such an import as we found in the case of previous laws, where the elements appeared as independent things, each being a particular body; nor, again, in the second place, do we find that the universal is to have its existence somewhere else outside what actually is. On the contrary, the organic being is, in undivided oneness and as a whole, the fundamental fact, it is the content of inner and outer, and is the same for both. The opposition is on that account of a purely formal character; its real sides have the same ultimate principle inherently constituting them what they are. At

the same time, however, since inner and outer are also opposite *realities* and each is a distinct being for observation, they each seem to observation to have a peculiar content of their own. This peculiar content, since it consists of the same substance, or the same organic unity, can, however, in point of fact, be only a different form of that unity, of that substance; and this is indicated by observation when it says that the outer is merely the *expression* of the inner.

We have seen in the case of the concept of purpose the same characteristic features of the relation, viz. the indifferent independence of the diverse factors, and their unity in that independence, a unity in which they disappear.

We have now to see what shape and embodiment inner and outer assume in actually existing. The inner as such must have an outer being and an embodiment, just as much as the outer as such; for the inner is an object, or is affirmed as being, and as present for observation to deal with.

The organic substance *qua* inner is the *Soul* simply, the pure notion of purpose or the universal which in dividing into its discrete elements remains all the same a universal fluent continuity, and hence in its being appears as activity or the movement of vanishing reality; while, on the other hand, the outer, opposed to that existing inner, subsists in the passive being of the organic. The law, as the relation of that inner to this outer, consequently expresses it content, now by setting forth universal moments, or simple essential elements, and again by setting forth the realized essential nature or the form and shape actually assumed. Those first simple organic properties, to call them so, are Sensibility, Irritability, and Reproduction. These properties, at least the two first, seem indeed to refer not to any and every organism, but merely to the animal organism. Moreover, the vegetable level of organic life expresses in point of fact only the bare and simple notion of an organism, which does not develop and evolve its moments. Hence in

regard to those moments, so far as observation has to take account of them, we must confine ourselves t the organism which presents them existing in developed form.

As to these moments, then, they are directly derived from the notion of self-purpose, of a being whose end is its own self. For Sensibility expresses in general the simple notion of organic reflexion into itself, or the universal continuity of this notion. Irritability, again, expresses organic elasticity, the capacity to exercise the function of reacting simultaneously with self-reflexion, and expresses, in contrast to the previous state of being passively and inertly within itself, the condition of being explicitly actualized-a realization, where that abstract existence for its own sake is an existence for something else. Reproduction, however, is the operation of this entire self-reflected organism, its activity as having its purpose in itself, its activity *qua* genus, wherein the individual repels itself from itself, where in procreating it repeats either the organic parts or the whole individual. Reproduction, taken in the sense of self-preservation in general, expresses the formal principle or conception of the organic, or the fact of Sensibility; but it is, properly speaking, the realized notion of organic existence, or the whole, which either *qua* individual returns into itself through the process of producing individual parts of itself, or *qua* genus does so through the production of distinct individuals.

The other significance of these organic elements, viz. as outer, is their embodiment in a given shape; here they assume the form of actual but at the same time universal parts, or appear as organic systems. Sensibility is embodied in the form, for instance, of a nervous system, irritability, of a muscular system, reproduction, of an intestinal system for the preservation of the individual and the species.

Laws peculiar to organic life, accordingly, concern a relation of the organic moments, taking account of their twofold significance — viz. of

being in one respect a part of definite organic formation or embodiment, and in another respect a continuous universal element of a determinate kind, running through all those systems. Thus in giving expression to a law of that sort, a specific kind of sensibility, e.g. would find, *qua* moment of the whole organism, its expression in a determinately formed nervous system, or it would also be connected with a determinate reproduction of the organic parts of the individual or with the propagation of the whole, and so on. Both aspects of such a law can be observed. The external is in its very conception being for another; sensibility, e.g. finds its immediately realized form in the sensitive system; and, *qua* universal property, it is in its outer expressions an objective fact as well. The aspect which is called "inner" has its own outer" aspect, which is distinct from what is in general called the outer.

Both the aspects of an organic law would thus certainly be open to observation, but not the laws of their relation. And observation is inadequate to perceive these laws, not because, *qua* observation, it is too short-sighted, i.e. not because, instead of proceeding empirically, we ought to start from the "Idea" — for such laws, if they were something real must, as a matter of fact, be actual, and must thus be observable; it is rather because the thought of laws of this sort proves to have no truth at all.

The relation assumed the role of a law in the case where the universal organic property had formed itself in an organic system into a thing and there found its own embodied image and copy, so that both were the same reality, present, in the one case, as universal moment, in the other, as thing. But besides, the inner aspect is also by itself a relation of several aspects; and hence to begin with there is presented the idea of a law as a relation of the universal organic activities or properties to one another. Whether such a law is possible has to be decided from the nature of such a property. Such a property, however, being universal and of a fluid nature, is, on the one hand,

not something restricted like a thing, keeping itself within the distinction of a definite mode of existence, which is to constitute its shape and form: sensibility goes beyond the nervous system and pervades all the other systems of the organism. On the other hand, such a property is a universal moment, which is essentially undivided, and inseparable from reaction, or irritability, and reproduction. For, being reflection into self, it *eo ipso* already implies reaction. Merely to be reflected into itself is to be a passive, or lifeless being, and not,sensibility; just as action — which is the same as reaction — when not reflected into self, is not irritability. Reflexion in action or reaction, and action or reaction in reflexion, is just that whose unity constitutes the organic being, a unity which is synonymous with organic reproduction. It follows from this that in every mode of the organism's actuality there must be present the same quantity of sensibility — when we consider, in the first instance, the relation of sensibility and irritability to one another — as of irritability, and that an organic phenomenon can be apprehended and determined or, if we like, explained, just as much in terms of the one as of the other. What one man takes for high sensibility, another may just as rightly consider high irritability. and an irritability of the *same* degree. If they are called factors, and this is not to be a meaningless phrase, it is thereby expressly stated that they are moments of the notion; in other words, the real object, the essential nature of which this notion constitutes, contains them both alike within it, and if the object is in one way characterized as very sensitive, it must be also spoken of in the other way as likewise very irritable.

If they are distinguished, as they must be, they are so in their true nature (*dem Begriffe, nach*), and their opposition is *qualitative*. But when, besides this true distinction, they are also set down as different, *qua* existent and for thought, as they might be if made aspects of the law, then they appear quantitatively distinct. Their peculiar qualitative opposition thus passes into

quantity; and hence arise laws of this sort, e.g. that sensibility and irritability stand in inverse quantitative relations, so that as the one increases the other diminishes; or better, taking directly the quantity itself as the content, that the, magnitude of something increases as its smallness diminishes.

Should a specific content be given to this law, however, by saying, for example, that the size of a hole increases the more we decrease what it is filled with, then this inverse relation might be just as well changed into a direct relation and expressed in the form that the quantity of a hole increases in direct ratio to the amount of things we take away — a tautological proposition, whether expressed as a direct or an inverse relation; so expressed it comes merely to this that a quantity increases as this quantity increases. The hole and what fills it and is removed from it are qualitatively opposed, but the real content there and its specific quantity are in both one and the same, and similarly the increase of magnitude and decrease of smallness are the same, and their meaningless opposition runs into a tautology. In like manner the organic moments are equally inseparable in their real content, and in their quantity which is the quantity of that reality. The one decreases only with the other, and only increases with it, for one has literally a significance only so far as the other is present. Or rather, it is a matter of indifference whether an organic phenomenon is considered as irritability or as sensibility; this is so in general, and likewise when its magnitude is in question: just as it is indifferent whether we speak of the increase of a hole as an increase of the hole qua emptiness or as an increase of the filling removed from it. Or, again, a number, say three, is equally great, whether I take it positively or negatively; and if I increase the three to four, the positive as well as the negative becomes four: just as the south pole in the case of a magnet is precisely as strong as its north pole, or

a positive electricity or an acid, is exactly as strong as its negative, or the base on which it operates.

An organic existence is such a quantum, like the number three or a magnet, etc. It is that which is increased or diminished, and if it is increased, then both its factors are increased, as much as both poles of the magnet or both kinds of electricity increase if the potential of a magnet or of one of the electric currents is raised.

That both are just as little different in intension and extension, that the one cannot decrease in extension and increase in intension, while the other conversely has to diminish its intension and increase in extension — this comes from the same notion of an unreal and empty opposition. The real intension is absolutely as great as the extension and vice versa.

What really happens in framing a law of this kind is obviously that at the outset irritability and sensibility are taken to constitute the specifically determinate organic opposition. This content, however, is lost sight of and the opposition goes off into a formal opposition of quantitative increase and diminution, or of different intension and extension — an opposition which has no longer anything to do with the nature of sensibility and irritability, and no longer expresses it. Hence this mere playing at law-making is not confined to organic moments but can be carried on everywhere with everything and rests in general on want of acquaintance with the logical nature of these oppositions.

Lastly, if, instead of sensibility and irritability, reproduction is brought into relation with one or other of them, then there is wanting even the occasion for framing laws of this kind; for reproduction does not stand in any opposition to those moments, as they are opposed to one another; and since the making of such laws assumes this opposition, there is no possibility here of its even appearing to take place.

The law-making just considered implies the differences of the organism, taken in the sense of moments of its notion, and, strictly speaking, should be an *a priori* process. But it essentially involves this idea, that those differences have the significance of being present as something given, and the attitude of mere observation has in any case to confine itself merely to their actual *existence*. Organic reality necessarily has within it such an opposition as its notion expresses, and which can be determined as irritability and sensibility, as these again both appear distinct from reproduction. The aspect in which the moments of the notion of organism are here considered, their Externality, is the proper and peculiar immediate externality of the inner; not the outer which is the outer embodied form of the whole organism; the inner is to be considered in relation to this later on.

If, however, the opposition of the moments is apprehended as it is found in actual existence, then sensibility, irritability, reproduction sink to the level of common properties, which are universals just as indifferent towards one another as specific weight, colour, hardness, etc. In this sense it may doubtless be observed that one organic being is more sensitive, or more irritable, or has a greater reproductive capacity than another: just as we may observe that the sensibility, etc., of one is in kind different from that of another, that one responds differently from another to a given simulus, e.g. a horse behaves differently towards oats from what it does towards hay, and a dog again differently towards both, and so on. These differences can as readily be observed as that one body is harder than another, and so on.

But these sense properties, hardness, colour, etc., as also the phenomena of responding to the stimulus of oats, of irritability under certain kinds of load, or of producing the number and kind of young — all such properties and phenomena, when related to one another and compared *inter se,* essentially defy the attempt to reduce them to law. For the characteristic of their being sensuous facts consists just in their existing in complete

indifference to one another, and in manifesting the freedom of nature emancipated from the control of the notion, rather than the unity of a relation — in exhibiting nature's irrational way of playing up and down the scale of contingent quantity between the moments of the notion, rather than in these forth these moments themselves.

It is the other aspect, in which tile simple moments of the notion of organism are compared with the moments of the actual embodiment, that would first furnish the law proper for expressing the true outer as the copy of the inner.

Now because those simple moments are properties that permeate and pervade the whole, they do not find such a detached real expression in the organic thing as to form what we call an individual system with a definite structure (*Gestalt*). Or, again, if the abstract idea of organism is truly expressed in those three moments merely because they are nothing stable, but moments of the notion and its process, the organism, on the other hand, *qua* a definite embodiment, is not exhaustively expressed in those three determinate systems in the way anatomy analyses and describes them. So far as such systems are to be found in their actual reality and rendered legitimate by being so found, we must also bear in mind that anatomy not only puts before us three systems of that sort, but a good many others as well.

Further, apart from this, the sensitive system as a whole must mean something quite different from what is called a nervous system, the irritable system something different from the muscular system, the reproductive from the intestinal mechanism of reproduction. In the systems constituting an embodied form *(Gestalt)* the organism is apprehended from the abstract side of lifeless physical existence: so taken, its moments are elements of a corpse and fall to be dealt with by anatomy; they do not appertain to knowledge and to the living organism. *Qua* parts of that sort they have

really ceased to be, for they cease to be processes. Since the being of an organism consists essentially in universality, or reflexion into self, the being of its totality, like its moments, cannot consist in an anatomical system. The actual expression of the whole, and the externalization of its moments, are really found only as a process and a movement, running throughout the various parts of the embodied organism; and in this process what is extracted as an individual system and fixated so, appears essentially as a fluid moment. So that the reality which anatomy finds cannot be taken for its real being, but only that reality as a process, a process in which alone even the anatomical parts have a significance.

We see, then, that the moments of the “inner” being of the organism taken separately by themselves are not capable of furnishing aspects of a law of being, since in a law of that sort they are predicated of an objective existence, are distinguished from one another, and thus each aspect would not be able to be equally named in place of the other. Further, we see that, when placed on one side, they do not find in the other aspect their realization in a fixed system; for this fixed system is as little something that could convey truly the general nature of organic existence, as it is the expression of those moments of the inner life of the organism. The essential nature of what is organic, since this is inherently something universal, lies altogether rather in having its moments equally universal in concrete reality, i.e. in having them as permeating processes, and not in giving a copy of the universal in an isolated thing.

In this manner the idea of a law in the case of organic existence slips altogether from our grasp. The law wants to grasp and express the opposition as static aspects, and to attach as predicates of them the characteristic which is really their relation to one another. The inner, to which falls the universality appearing in the process, and the outer, to which belong the parts of the static structure of the organism, were to constitute

the corresponding sides of the law; but they lose, in being kept asunder in this way, their organic significance. And at the bottom of the idea of law lies just this, that its two aspects should have a subsistence each on its own account indifferent to the other, and the relation of the two sides should be shared between them, thus appearing as a twofold characteristic corresponding to that relation. But really each aspect of the organism consists inherently in being simple universality, wherein all determinations are dissolved, and in being the process of this resolution.

If we quite see the difference between this way of framing laws and previous forms, it will clear up its nature completely. Turning back to the process of perceiving and that of understanding (intelligence), which reflects itself into itself, and by so doing determines its object, we see that understanding does not there have before itself in its object the *relation* of these abstract determinations, universal and individual, essential and external; on the contrary, it is itself the actual transition, the relational process, and to itself this transition does not become objective. Here, on the other hand, the organic unity, i.e. just the relation of those opposites, is itself the object; and this relation is a pure process of transition. This process in its simplicity is directly universality; and in that universality opens out into different factors, whose relation it is the purpose of the law to express, the moments of the process take the form of being *universal* objects of this mode of consciousness, and the law runs, “the outer is an expression of the inner”. Understanding has here grasped the thought of the law itself, whereas formerly it merely looked for laws in a general way, and their moments appeared before it in the shape of a definite and specific content, and not in the form of thoughts of laws.

As regards content, therefore, such laws ought not to have place in this connexion which merely passively accept and put into the form of universality purely existential distinctions; but such laws as directly

maintain in these distinctions the restless activity of the notion as well, and consequently possess at the same time necessity in the relation of the two sides. Yet, precisely because that object, organic unity, directly combines the endless superseding, or the absolute negation of, existence with inactive passive existence, and because the moments are essentially pure transition — there are thus not to be found any such merely existent aspects as are required for the law.

To get such aspects, intelligence must take its stand on the other moment of the organic relation, viz. on the fact that organic existence is reflected into itself. But this mode of being is so completely reflected into self that it has no specific character, no determinateness of its own as against something else, left over. The immediate sensuous being is directly one with the determinate quality as such, and hence inherently expresses a qualitative distinction, e.g. blue against red, acid against alkaloid, etc. But the *organic* being that has returned into itself is completely indifferent towards an other; its existence is simple universality, and refuses to offer observation any permanent sense distinctions, or, what is the same thing, shows its essential characteristic to be merely the changing flux of whatever determinate qualities there are. Hence, the way distinction *qua* actually existing expresses itself is just this, that it is an indifferent distinction, i.e. a distinction in the form of quantity. In this, however, the notion is extinguished and necessity disappears. If the content, however, and filling of this indifferent existence, the flux and interchange of sense determinations are gathered into the simplicity of an organic determination, then this expresses at the same time the fact that the content does not have that determinateness (the determinateness of the immediate property and the qualitative feature falls solely within the aspect of quantity, as we saw above.

Although the objective element, apprehended in the form of a determinate character of organic existence, has thus the notion inherent in it, and thereby is distinguished from the object offered to understanding, which in apprehending the content of its laws proceeds in a purely perceptive manner, yet apprehension in the former case falls back entirely into the principle and manner of mere percipient understanding, for the reason that the object apprehended is used to constitute moments of a law. For by this means what is apprehended receives and keeps the character of a fixed determinate quality, the form of an immediate property or a passive phenomenon; it is, further, subsumed under the aspect of quantity, and the nature of the notion is suppressed.

The exchange of a merely perceived object for one reflected into itself, of a mere sense character for an organic, thus loses once more its value, and does so by the fact that understanding has not yet cancelled the process of framing laws.

If we compare what we find as regards this exchange in the case of a few examples, we see, it may be, something that perception takes for an animal with strong muscles characterized as an animal organism of high irritability"; or, what perception takes to be a condition of great weakness, characterized as a "condition of high sensibility", or, if we prefer it, as an abnormal affection", and, moreover, a raising of it to a "higher power-expressions which translate sensuous facts into Teutonized Latin, instead of into terms of the notion. That an animal has strong muscles may also be expressed by understanding in the form that the animal "possesses a great muscular force" — great weakness meaning similarly "a slight force". Characterization in terms of irritability has this advantage over determination by reference to "force", that the latter expresses indeterminate, the former determinate reflexion into self; for the peculiar force characteristic of muscles is just irritability; and irritability is also a

preferable determination to “strong muscles”, in that, as in the case of force, reflexion into self is at once implied it, it. In the same way “weakness”, or “slight force”, organic passivity, is expressed in a determinate manner by sensibility. But when this sensibility is so taken by itself and fixed, and the element of quality is in addition bound up with it, and *qua* greater or less sensibility is opposed to a greater or less irritability, each is reduced entirely to the level of sense, and degraded to the ordinary form of a sense property; their principle of relation is not the notion, but, on the contrary, it is the category of quantity into which the opposition is now cast, thus becoming a distinction not constituted by thought. While in this way the indeterminate nature of the expressions, “force”, “strength”, “weakness”, would indeed be got rid of, there now arises the equally futile and indeterminate process of dealing with the oppositions of a higher and lower degree of sensibility and irritability, as they increase and decrease relatively to one another. The greater or less sensibility or irritability is no less a sensuous phenomenon, grasped and expressed without any reference to thought, than strength and weakness are sense determinations not constituted by thought. The notion has not taken the place of those non-conceptual expressions; instead, strength and weakness have been given a filling by a characteristic which, taken by itself alone, rests on the notion, and has the notion as its content, but loses entirely this origin and character.

Owing to the form of simplicity and immediacy, then, in which this content is made an element of a law, and through the element of quantity, which constitutes the principle of distinction for such determinations, the essential nature, which originally is a notion and is put forward as such, retains the character of sense perception, and remains as far removed from knowledge (*Erkennen*) as when characterized in terms of strength or weakness of force, or through immediate sense properties.

There is still left to consider what the outer side of the organic being is when taken by itself alone, and how in its case the opposition of its inner and outer is determined; just as at first we considered the inner of the whole in relation to its own proper outer.

The outer, looked at by itself, is the embodied form and shape (*Gestaltung*) in general, the system of life articulating itself in the element of existence, and at the same time essentially the existence of the organism as it is for an other — objective reality in its aspect of self-existence. This other appears in the first instance as its outer *inorganic nature*. If these two are looked at in relation to a law, the inorganic nature cannot, as we saw before, constitute the aspect of a law beside the organic being, because the latter exists absolutely for itself, and assumes a universal and free relation to inorganic nature.

To define more exactly, however, the relation of these two aspects in the case of the organic form, this form, in which the organism is embodied, is in one aspect turned against inorganic nature, while in an other it is for itself and reflected into itself. The real organic being is the mediating agency, which brings together and unites the self-existence of life [its being *for* itself], with the outer in general, with what simply and inherently *is*.

The one extreme, self-existence, is, however, the inner in the sense of an infinite "one", which takes the moments of the embodied shape itself out of their subsistence and connexion with outer nature and withdraws these moments back into itself; it is that which, having no content, looks to the embodied form of the organism to provide its content, and appears there as the *process* of that form. In this extreme where it is mere negativity, or pure individual existence, the organism possesses its absolute freedom, whereby it is made quite secure and indifferent towards the fact of its being relative to another and towards the specific character belonging to the moments of the form of the organism. This free detachment is at the same time a

freedom of the moments themselves; it is the possibility of their appearing and of being apprehended as existent. And just as they are therein detached and indifferent in regard to what is outer, so too are they towards one another; for the simplicity of this freedom is being or is their simple substance. This notion or pure freedom is one and the same life, no matter how varied and diverse the ways in which the shape assumed by the organism, its "being, for another", may disport itself; it is a matter of indifference to this stream of life what sort of mills it drives.

In the first place, we must now note that this notion is not to be taken here, as it was formerly when we were considering the inner proper, in its character as the process or development of its moments; we must take it in its form as simple "inner", which constitutes the purely universal aspect as against the concrete living reality; it is the element in which the existing members of the organic shape find their subsistence. For it is this shape we are considering here, and in it the essential nature of life appears as the simple fact of subsistence. In the next place, the existence for another, the specific character of the real embodied form, is taken up into this simple universality, in which its nature lies, a specificity that is likewise of a simple universal non-sensuous kind, and can only be that which finds expression in *number*. Number is the middle term of the organic form, which links indeterminate life with actual concrete life, simple like the former and determinate like the latter. That which in the case of the former, the inner, would have the sense of number, the outer would require to express after *its* manner as multiform reality — kinds of life, colour, and so on, in general as the whole host of differences which are developed as phenomena of life.

If the two aspects of the organic whole-the one being the inner, while the other is the outer, in such a way that each again has in it an inner and an outer — are compared with reference to the inner both sides have, we find that the inner of the first is the notion, in the sense of the restless activity of

abstraction; the second has for its inner, however, inactive universality, which involves also the constant characteristic-number. Hence, if, because the notion develops its moments in the former, this aspect made a delusive promise of laws owing to the semblance of necessity in the relation, the latter directly disclaims doing so, since number shows itself to be the. determining feature of one aspect of its laws. For number is just that entirely inactive, inert, and indifferent characteristic in which every movement and relational process is extinguished, and which has broken the bridge leading to the living expression of impulses, manner of life, and whatever other sensuous existence there is.

This way of considering the embodied organic shape as such and the inner *qua* inner merely of that embodied form, is, however, in point of fact, no longer a consideration of organic existence. For both the aspects, which were to be related, are merely taken thereby reflection into indifferent to one another, and self, the essential nature of organism, is done away with. What we have done here is rather to transfer that attempted comparison of inner and outer to the sphere of inorganic nature. The notion with its infinity is here merely the inner essence, which lies hidden away within or falls outside in self-consciousness, and no longer, as in the case of the organism, has its presence in an object. This relation of inner and outer has thus still to be considered in its own proper sphere.

In the first place, that inner element of the form, being the simple individual existence of an inorganic thing, is the *specific gravity.* As a simply existing fact, this can be observed just as much as the characteristic of number, which is the only one of which it is capable; or properly speaking can be found by comparing observations; and it seems in this way to furnish one aspect of the law. The embodied form, colour, hardness, toughness, and an innumerable host of other properties, would together constitute the outer aspect, and would have to give expression to the

characteristic of the inner, number, so that the one should find its counterpart in the other.

Now because negativity is here taken not in the sense of a movement of the process, but as an inoperative unity, or as simple self-existence, it appears really as that by which the thing resists the process, and maintains itself within itself, and in a condition of indifference towards it. By the fact, however, that this simple self-existence is an inactive indifference towards an other, specific gravity appears as one property alongside others; and therewith all necessary relation on its part to this plurality, or, in other words, all conformity to law, ceases.

The specific gravity in the sense of this simple inner aspect does not contain difference *in itself,* or the difference it has is merely non-essential; for its bare simplicity just cancels every distinction of an essential kind. This non-essential difference, quantity, was thus bound to find its other or counterpart in the other aspect, the plurality of properties, since it is only by doing so that it is difference at all. If this plurality itself is held together within the simple form of opposition, and is determined, say, as cohesion, so that this cohesion is self-existence in otherness, as specific gravity is pure self-existence, then cohesion here is in the first place this pure conceptually constituted characteristic as against the previous characteristic. The mode of framing the law would thus be what we discussed above, in dealing with the relation of sensibility to irritability. In the next place, cohesion, *qua* conception of self-existence in otherness, is merely the abstraction of the aspect opposed to specific gravity, and as such has no existential reality. For self-existence in otherness is the process wherein the inorganic would have to express its self-existence as a form of self-conservation, which on the other hand would prevent it emerging from the process as a constituent moment of a product. But this goes directly against its nature, which has no purpose or universality in it. Rather, its process is

simply the determinate course of action by which its self-existence, in the sense of its specific gravity, cancels itself. This determinate action, which in that case would constitute the true principle implied in its cohesion, is itself however entirely indifferent to the other notion, that of the determinate quantity of its specific gravity. If the mode of action were left entirely out of account, and attention confined to the idea of quantity, we might be able to think of a feature like this: the greater specific weight, as it is a higher intensiveness of being (*Insichseyn*), would resist entering into the process more than a less specific weight. But on the contrary, freedom of self-existence (*Fürsichseyn*) shows itself only in facility to establish connexion with everything, and maintain itself throughout this manifold variety. That intensity without extension of relations is an abstraction with no substance in it, for extension constitutes the existence of intensity. The self-conservation of the inorganic element in its relation lies however, as already mentioned, outside its nature, since it does not contain the principle of movement within it or because its being is not absolute negativity and not a notion.

When this other aspect of the inorganic, on the other hand, is considered not as a process, but as an inactive being, it is ordinary cohesion. It is a simple sense property standing on one side over against the free and detached moment of otherness, which lies dispersed into a plurality of properties indifferent to and apart from one another, and which itself comes under this (cohesion) as does specific gravity. The multiplicity of properties together, then, constitutes the other side to cohesion. In its case, however, as in the case of the multiplicity, number is the only characteristic feature. which not merely does not bring out a relation and a transition from one to another of these properties, but consists essentially in having no necessary relation; its nature is rather to make manifest the absence of all conformity to law, for it expresses the determinate character as one that is non-essential.

Thus we see that a series of bodies, whose difference is expressed as a numerical difference of their specific weights, by no means runs parallel to a series where the difference is constituted by the other properties, even if, for purposes of simplification, we select merely one or some of them. For, as a matter of fact, it could only be the *tout ensemble* of the properties which would have to constitute the other parallel aspect here. To bring this into orderly shape and to make it a connected single whole, observation finds at hand the quantitative determinations of these various properties; on the other hand, however, their differences come to light as qualitative. Now, in this collection, what would have to be characterized as positive or negative, and would be cancelled each by the other — in general, the internal arrangement and exposition of the equation, which would be very composite — would belong to the notion. The notion however is excluded from operating just by the way in which the properties are found lying, and are to be picked up as mere existent entities. In this condition of mere being, none is negative in its relation to another: the one exists just as much as the other, nor does it in any other fashion indicate its position in the arrangement of the whole.

In the case of a series with concurrent differences — whether the relation is meant to be that of simultaneous increase on both sides or of increase in the one and decrease in the other — interest centres merely in the last simple expression of this combined whole, which would constitute the one aspect of the law with specific gravity for the opposite. But this one aspect, *qua* resultant fact, is nothing else than what has been already mentioned, viz. an individual property, say, like ordinary cohesion, alongside and indifferent to which the others, specific gravity among them, are found lying, and every other can be selected equally rightly, i.e. equally wrongly, to stand as representative of the entire other aspect; one as well as the other would merely "represent" or stand for [German *vorstellen*] the essential

reality (*Wesen*), but would not actually be the fact (*Sache*) itself. Thus it seems that the attempt to find series of bodies which should in their two aspects run continuously and simply parallel, and express the essential nature of the bodies in a law holding of these aspects, must be looked at as an aim that is ignorant alike of what it is about and of the means for carrying it through.

Heretofore the relation between the inner and outer phases in the organic form set before observation was forthwith transferred to the sphere of the inorganic. The determinate condition to which this is due can now be stated more precisely; and there arises thence a further form and relation of this situation. What seems to present the possibility of such a comparison of inner and outer in the case of the inorganic, drops away altogether when we come to the organic. The inorganic inner is a simple inner, which comes before perception as a merely existent property. Its characteristic determination is therefore essentially quantity, and it appears as an existent property indifferent towards the outer, or the plurality of other sense properties. The self-existence of the living organism, however, does not so stand on one side opposed to its outer; it has the principle of otherness in itself. If we characterize self-existence as a simple self-preserving relation to self, its otherness is simple negativity; and organic unity is the unity of self-identical self-relation and pure negativity. This unity is *qua* unity the inwardness of the organic; the organic is thereby inherently universal, it is a *genus*. The freedom of the genus with reference to its realization is, however, something different from the freedom of specific gravity with reference to embodied form. That of the latter is freedom in the sphere of existence (*seyende Freiheit*), in the sense that it takes its stand on one side as a particular property. But because it is an existent freedom, it is also only a determinate character which belongs essentially to this embodied form, or by which this form *qua* essence is something determinate. The freedom,

however, of the genus is a universal freedom, and indifferent to this embodied form, or towards its realization. The determinateness which attaches to self-existence as such of the inorganic, falls therefore in the case of the organic under its self-existence, while in the case of the inorganic it applies merely to the existence of the latter. Hence, although in the case of the latter that determinate characteristic appears at the same time only as a property, yet it possesses the value of being essential, because *qua* pure negative it stands over against concrete existence which is being for another; and this simple negative in its final and particular determinateness is a number. The organic, however, is a form of singleness, which is itself pure negativity, and hence abolishes within it the fixed determinateness of number, which is applicable to the indifference of mere being. So far as it has in it the moment of indifferent being and thereby of number, this numerical aspect can therefore only be regarded as an incident within it, but not as the essential nature of its living activity.

But now, though pure negativity, the principle of the process, does not fall outside the organic, and though the organic does not in its essence *possess* negativity as an adjectival characteristic, the singleness of the individual organism *being* instead inherently universal, yet this pure singleness is not therein developed and realized in its various moments as if these were themselves abstract or universal. On the contrary, this developed expression makes its appearance outside that universality, which thus falls back into mere inwardness; and between the concrete realization, the embodied form, i.e. the self-developing individual *singleness* of the organism, and the organic universal, the *genus*, appears the determinate or specific universal, the *species*. The existential form, to which the negativity of the universal, the negativity of the genus, attains, is merely the explicitly developed movement of a process, carried out among the parts of the given shape assumed by the organism. If the genus had the different parts within

itself as an unbroken simple unity, so that its simple negativity as such were at the same time a movement, carried on through parts equally simple and directly universal in themselves, which were here actual as such moments, then the organic genus would be consciousness. But, as it is, the simple determinate character, *qua* determinateness of the species, is present in an unconscious manner in the genus; concrete realization *starts* from the genus; in other words what finds express realization is not the genus as such, i.e. not really thought. This genus, *qua* actual organic fact, is merely represented by a deputy. Number, which is the representative here, seems to designate the transition from the genus into the individual embodiment, and to set before observation the two aspects of the necessary constitution, now in the form of a simple characteristic, and again in the form of an organic shape with all its manifold variety fully developed. This representative, however, really denotes the indifference and freedom of the universal and the individual as regards one another; the genus puts the individual at the mercy of mere quantitative difference, a non-essential element, but the individual *qua* living shows itself equally independent of this difference. True universality, in the way specified, is here merely *inner nature*; *qua* characteristic determining the species it is formal universality; and in contrast to the latter, that true universality takes its stand on the side of organic individual singleness, which is thereby a living individual entity, and owing to its inner nature is not concerned with its determinate character *qua* species. But this singleness is not at the same time a universal individual, i.e. one in which universality would have external realization as well; i.e. the universal individual falls outside the living organic whole. This universal individual, however, in the way it is immediately the individual of the natural embodiments of organic life, is not consciousness itself: its existence *qua* single organic living individual could not fall outside that universal if it were to be consciousness.

We have, then, here a connected system, where one extreme is the universal life *qua* universal or genus, the other being that same life *qua* a single whole, or universal individual: the mediating term, however, is a combination of both, the first seeming to fit itself into it as determinate universality or as species, the other as single whole proper or single individuality. And since this connected system belongs altogether to the aspect of the organic embodiment, it comprehends within it too what is distinguished as inorganic nature.

Since, now, the universal life *qua* the simple essence of the genus develops from its side the distinctions of the notion, and has to exhibit them in the form of a series of simple determining characteristics, this series is a system of distinctions set up indifferently, or is a numerical series. Whereas formerly the organic in the form of something individual and single was placed in opposition to this non-essential distinction [of quantity], a distinction which neither expresses nor contains its living nature: and while precisely the same has to be stated as regards the inorganic, taking into account its entire existence developed in the plurality of its properties: it is now the universal individual which is not merely to be looked on as free from every articulation of the genus, but also as the power controlling the genus. The genus disperses into species in terms of the universal characteristic of number, or again it may adopt as its principle of division particular characteristics of its existence like figure, colour, etc. While quietly prosecuting this aim, the genus meets with violence at the hands of the universal individual, the earth, which in the role of universal negativity establishes the distinctions as they exist within itself — the nature of which, owing to the substance they belong to, is different from the nature of those of the genus — and makes good these distinctions as against the process of generic systematization. This action on the part of the genus comes to be quite a restricted business, which it can only carry on inside those mighty

elements, and which is left with gaps and arrested and interrupted at all points through their unbridled violence.

It follows from all this that in the embodied, organic existence observation can only meet with reason in the sense of life in general, which, however, in its differentiating process involves really no rational sequence and organization, and is not an immanently grounded system of shapes and forms. If in the logical process of the moments involved in organic embodiment the mediating term, which contains the species and its realization in the form of a single individuality, had within it the two extremes of inner universality and universal individuality, then this middle term would have, in the movement of its reality, the expression and the nature of universality, and would be self-systematizing development. It is thus that consciousness takes as the middle term between universal spirit and its individuation or sense-consciousness, the system of shapes assumed by consciousness, as an orderly self-constituted whole of the life of spirit, the system of forms of conscious life which is dealt with in this treatise, and which finds its objective existential expression as the history of the world. But organic nature has no history; it drops from its universal — life — immediately into the individuation of existence; and the moments of simple determinateness and individual living activity which are united in this realization, bring about the process of change merely as a contingent movement, wherein each plays its own part and the whole is preserved. But the energy thus exerted is restricted, so far as itself is concerned, merely to its own fixed centre, because the whole is not present in it; and the whole is not there because the whole is not as such here for itself.

Besides the fact, then, that reason in observing organic nature only comes to see itself as universal life in general, it comes to see the development and realization of this life merely by way of systems distinguished quite generally, in the determination of which the essential

reality lies not in the organic as such, but in the universal individual [the earth]; and among these distinctions of earth [it comes to see that development and realization] in the form of sequences which the genus attempts to establish.

Since, then, in its realization, the universality found in organic life lets itself drop directly into the extreme of individuation, without any true self-referring process of mediation, the thing before the observing mind is merely a would-be “meaning”; and if reason can take an idle interest to observe what is thus “meant” here, it is confined to describing and recording nature’s meanings” and incidental suggestions. This irrational freedom of “fancying” doubtless will proffer on all sides beginnings of laws, traces of necessity, allusions to order and sequence, ingenious and specious relations of all kinds. But in relating the organic to the different facts of the inorganic, elements, zones, climates, so far as regards law and necessary connexion, observation never gets further than the idea of a “great influence”. So, too, on the other side, where individuality has not the significance of the earth, but of the oneness immanent in organic life, and where this, in immediate unity with the universal, no doubt constitutes the genus, whose simple unity however, is just for that reason determined merely as a number and hence lets go the qualitative appearance; — here observation cannot get further than to make clever remarks, bringing out interesting points in connexion, a friendly condescension to the notion. But clever remarks do not amount to a knowledge of necessity; interesting points of connexion stop short at being simply of interest, while the interest is still nothing but fanciful “opinion” about the rational; and the friendliness of the individual in making allusion to a notion is a childlike friendliness, which is childish if, as it stands, it is to be or wants to be worth anything.

b

Observation of Self-Consciousness in its Pure Form and in its Relation to External Reality — Logical and Psychological Laws

Translator's comments: Observation can be directed upon the self-conscious process of mind in two ways: it may consider the mind's thinking relation to reality, and it may consider the mind's active or biotic relation to reality. The result of observation here, as in the foregoing cases, finds expression in a number of laws, which it "frames". The "laws" in the first case are "laws of thought" or connected logical laws: in the latter case we have laws of psychic events, "psychological" laws.

The analysis in this section shows the inadequacy of observation as such to deal with its material in both cases. It fails in the first case because "laws of thought" have no meaning apart from the reality with which thought is necessarily concerned; laws of thought are laws of "thinking", and thinking is both form and content: observation gives each law an absolute being of its own, as if it were detached from the unity of self-consciousness, whereas this unity is the fundamental principle of each and al the laws, which only exist in and by the single process of that unity. Hence a type of logic confined to "observing" laws of thought is necessarily untrue. Observation again fails in the second case because it is impossible to separate mind from its total environment. Observational or empirical psychology therefore is incapable of giving an adequate account of mind the constitution of the environment enters into and in part determines the constitution of the psychic events, and the latter cannot be explained even as events without interpreting the former at the same time.

b.

Observation of Self-Consciousness in its Pure Form and in its Relation to External Reality — Logical and Psychological Laws

Observation of nature finds the notion realized in inorganic nature, laws, whose moments are things which at the same time are in the position of abstractions. But this notion is not a simplicity reflected into self. The life of organic nature, on the other hand, is only this self-reflected simplicity. The opposition within itself, in the sense of the opposition of universal and individual, does not make its appearance in the essential nature of this life itself with one factor apart from the other. Its essential nature is not the genus, self-sundered and self-moved in its undifferentiated element, and remaining at the same time for itself undifferentiated in its opposition. Observation finds this free notion, whose universality has just as absolutely within it developed individuality, only in the notion which itself exists as notion, i.e. in self-consciousness.

When observation now turns in upon itself and directs itself on the notion which is real *qua* free notion, it finds, to begin with, the *Laws of Thought*. This kind of individuality, which thought is in itself, is the abstract movement of the negative, a movement entirely introverted into simplicity; and the laws are outside reality.

To say "they have no reality" means in general nothing else than that they are without any truth. And in fact they do not claim to be entire truth, but still *formal* truth. But what is purely formal without reality is an *ens intellectus*, or empty abstraction without the internal diremption which would be nothing else but the content.

On the other hand, however, since they are laws of pure thought, while the latter is the inherently universal, and thus a kind of knowledge, which immediately contains being and therein all reality, these laws are absolute notions, and axe in one and the same sense the essential principles of form as well as of things. Since self-directing, self-moving universality is the simple notion in a state of diremption, this notion has in this manner a content in itself, and one which is *all content* except sensuous, not a being

of sense. It is a content, which is neither in contradiction with the form nor at all separated from it; rather it is essentially the form itself; for the latter is nothing but the universal dividing itself into its pure moments.

In the way in which this form or content, however, comes before observation *qua* observation, it gets the character of a content that is found, given, i.e. one which merely *is*. It becomes a passively existing basis of relations, a multitude of detached necessities, which as a definitely fixed content are to have truth just as they stand with their specific characteristic, and thus, in point of fact, are withdrawn from the form.

This absolute truth of fixed characteristics, or of a plurality of different laws, contradicts, however, the unity of self-consciousness, contradicts the unity of thought and form in general. What is declared to be a fixed and inherently constant law can be merely a moment of the self-referring, self-reflecting unity, can come on the scene merely as a vanishing element. When extricated, however, by the process of considering them, from the movement imposing this continuous connexion, and when set out individually and separately, it is not content that they lack, for they have a specific content; they lack rather form, which is their essential nature. In point of fact it is not for the reason that they are to be merely formal and are not to have any content, that these laws are not the truth of thought; it is rather for the opposite reason. It is because in their specificity, i.e. just as a content with the form removed, they want to pass for something absolute. In their true nature, as vanishing moments in the unity of thought, they would have to be taken as knowledge or as thinking process, but not as laws of knowledge. Observing, however, neither is nor knows that knowledge itself; observation converts its nature into the shape of an objective *being*, i.e. apprehends its negative character merely as laws of being.

It is sufficient for our purpose here to have indicated the invalidity of the so-called laws of thought from the consideration of the general nature of the

case. It falls to speculative philosophy to go more intimately and fully into the matter, and there they show themselves to be what in truth they are, single vanishing moments, whose truth is simply the whole of the think process, knowledge itself.

This negative unity of thought exists for its own sake, or rather it is just being for itself and on its own account, the principle of individuality; and its reality consists in exercising a function, it is an active consciousness. Consequently the mental attitude of observation will by the nature of the case be led on towards this as being the reality of those laws of thought. Since this connexion is not a fact for observation, the latter supposes that thought with its laws remains standing separately on one side, and that, on the other side, it obtains another objective being in what is now the object observed, viz. that acting consciousness, which exists for itself in such a way as to cancel otherness and find its reality in this direct awareness of itself as the negative.

In the active practical reality of consciousness, observation thus finds opened up before it a new field. *Psychology* contains the collection of laws in virtue of which the mind takes up different attitudes towards the different forms of its reality given and presented to it in a condition of otherness. The mind adopts these various attitudes partly with a view to receiving these modes of its reality into itself, and conforming to the habits, customs, and ways of thinking it thus comes across, as being that wherein mind is reality and as such object to itself; partly with a view to knowing its own spontaneous activity in opposition to them, to follow the bent of its own inclinations, affections, and emotions, and carry off thence what is merely of particular and special moment for itself, and thus make what is objective conform to itself. In the former it behaves negatively towards itself as single and individual mind, in the latter negatively towards itself as the universal being.

In the former aspect independence [or self-dependence] gives what is met with merely the form of conscious individuality in general, and as regards the content remains within the general reality given; in the second aspect, however, it gives the reality at least a certain special modification, which does not contradict its essential content, or even a modification by which the individual *qua* particular reality and peculiar content sets itself against the general reality. This opposition becomes a form of wrongdoing when the individual cancels that reality in a merely particular manner, or when it does so in a manner that is general and thus for all, when it puts another world, another right, law, and custom in place of those already there.

Observational psychology, which in the first instance states what observation finds regarding the general forms brought to its notice in the active consciousness, discovers all sorts of faculties, inclinations, and passions; and since, while narrating what this collection contains, the remembrance of the unity of self-consciousness is not to be suppressed, observational psychology is bound to get the length at least of wonderment that such a lot and such a miscellany of things can happen to be somehow alongside one another in the mind as in a kind of bag, more especially when they are seen to be not lifeless inert things, but restless active processes.

In telling over these various faculties observation keeps to the universal aspect: the unity of these multifarious capacities is the opposite aspect to this universality, is the actual concrete individuality.

To take up again thus the different concrete individualities, and to describe how one man has more inclination for this the other for that, how one has more intelligence than the other — all this is, however, something much more uninteresting than even to reckon up the species of insects, mosses, and so on. For these latter give observation the right to take them thus individually and disconnectedly (*begrifflos*), because they belong

essentially to the sphere of fortuitous detailed particulars. To take conscious individuality on the other hand, as a particular phenomenal entity, and treat it in so wooden a fashion, is self-contradictory, because the essential nature of individuality lies in the universal element of mind. Since, however, the process of apprehending it causes it at the same time to pass into the form of universality, to apprehend it is to find its law, and seems in this way to have a rational purpose in view, and a necessary function to fulfil.

The moments constituting the content of the law are on the one hand individuality itself, on the other its universal inorganic nature, viz. the given circumstances, situation, habits, customs, religion, and so forth; from these the determinate individuality is to be understood and comprehended. They contain something specific, determinate, as well as universal, and are at the same time something lying at hand, which furnishes material for observation and on the other side expresses itself in the form of individuality.

The law of this relation of the two sides has now to contain and express the sort of effect and influence these determinate circumstances exert on individuality. This individuality, however just consists both in being the universal, and hence in passively and directly assimilating and blending with the given universals, the customs, habits, etc., thus becoming conformed to them, as also in taking up an attitude of opposition towards them and thus transforming and transmuting them; and again in behaving towards them in its individual character with complete indifference, neither allowing them to exert an influence over it, nor setting itself actively against them. On that account *what* is to have an influence on individuality, and what *sort* of influence it is to have — which, properly speaking, mean the same thin-depend entirely on individuality itself: to say that by such and such an influence this individuality has become this specifically determinate individuality means nothing else than saying it has been this all along.

Circumstances, situation, customs, and so on, which show themselves on one side as something given, and on the other as within this specific individuality, reveal merely indeterminate nature of individuality, which is not the point under consideration. If these circumstances, style of thought, customs, the whole state of the world, in short, had not been, then assuredly the individual would not have been what he is; for all the elements that find a place in this “ state of the world “ constitute this universal substance.

By the way, however, in which the state of the world has affected in particular any given individual — and it is such an individual that has to be comprehended — it must itself have assumed a particular shape on its own account, and have operated upon the individual in the specific character which it assumed. Only so could it have made the individual the specific particular individual he is. If the external element is so constituted in and for itself as it appears in individuality, the latter would be comprehended from the nature of the former. We should have a double gallery of pictures, one of which would be the reflexion of the other: the one the gallery of external circumstance completely encompassing, circumscribing, and determining the individual, the other the same gallery translated into the form in which those circumstances are in the conscious individual: the former the spherical surface, the latter the centre reflectively representing that surface within it.

But the spherical surface, the world for the individual, carries on the face of it this double meaning: it is in and for itself the actual world and situation, and it is the world of the individual. It is the world of the individual either in so far as this individual was merely fused and blended with it, had let that world, just as it is, pass into its own nature, and had taken up towards it merely the attitude of a formal consciousness; or, on the other hand, it is the world of the individual in the sense in which the given has been transformed and transmuted by that individual.

Since reality is capable of having this twofold meaning on account of this freedom of the individual, the world of the individual is only to be understood from the individual himself; and the influence of reality upon the individual, a reality which is represented as having a being all its own (*an und für sich*), receives through this individual absolutely the opposite significance — the individual either lets the stream of reality flowing in upon it have its way, or breaks off and diverts the current of its influence. In consequence of this, however, “ psychological necessity” becomes an empty phrase, so empty that there is the absolute possibility that what is said to have this influence could equally well not have had it.

Herewith drops out of account that existence which was to be something all by itself, and was meant to constitute one aspect, and that the universal aspect, of a law. Individuality is what its world, in the sense of its own world, is. Individuality itself is the cycle of its own action, in which it has presented and established itself as reality, and is simply and solely a unity of what is given and what is constructed — a unity aspects do not fall apart, as in the idea of psychological law, into a world given *per se* and an individuality existing for itself. Or if those aspects are thus considered each by itself, there is no necessity to be found between them, and no law of their relation to one another.

c.

Observation of the Relation of Self-Consciousness To its Immediate Actuality — Physiognomy and Phrenology.

Translator’s comments: In the previous section observation was directed upon the relation of mind to external reality — the natural environment of individuality. The relation of mind to its own physical embodiment furnishes a further object for observation to take up. How observation

operates in dealing with this relation forms the subject of the analysis in the present section.

Up to and at the time at which Hegel wrote, the discussion of this relation took the form of what are now looked upon either as spurious sciences or at best as falling within the scope of physiology or psychophysics. Those pseudo-sciences were Physiognomy and Phrenology or Cranioscopy. Both had in one form or another engaged the attention of reflective minds from the earliest times. But about the latter half of the eighteenth century they gained unusual public prominence, in Germany, France and England, through the eloquence and conviction of their exponents; so much so that in Germany a law was passed forbidding the promulgation of phrenology as being dangerous to religion, and in England a law of George II re-enacted a statute of Elizabeth imposing the severest penalties on physiognomists. The chief exponents and propagandists of these studies of the human individual were Lavater (1741-1801), in physiognomy, and Gall (1758-1828), along with his pupil Spurzheim, in phrenology. The personal character and influence of the first, combined with his rhetorical eloquence, compelled the attention not only of the popular mind but of men of outstanding intelligence; while Gall lectured publicly and went from one University to another expounding the generalizations discovered or made.

It was impossible therefore for any philosopher who attempted to discuss comprehensively the methods and procedure of observational science to ignore the claims made by these pseudo-sciences or to refuse to examine the validity of the laws they proposed to formulate. This was all the more necessary because the object they dealt with — the relation of mind to its physical embodiment — was and is unquestionably an important fact of experience and presents a serious problem to philosophy, especially to idealism. Hence we have in the following section an elaborate analysis of

the observational "sciences" of physiognomy and phrenology — an analysis the length of which can only be explained and justified by the historical circumstances above indicated.

Observation of the Relation of Self-Consciousness To its Immediate Actuality — Physiognomy and Phrenology.

PSYCHOLOGICAL observation discovers no law for the relation of self-consciousness to actuality or the world over against it; and owing to their mutual indifference it is forced to fall back on the peculiar determinate characteristic of real individuality, which has a being in and for itself or contains the opposition of subjective self-existence (*Fürsichseyn*) and objective inherent existence (*Ansichseyn*) dissolved and extinguished within its own process of absolute mediation. Individuality is now the object for observation, or the object to which observation now passes.

The individual exists in himself and for himself. He is for himself, or is a free activity; he is, however, also in himself, or has himself an *original* determinate being of his own — a character which is in principle the same as what psychology sought to find outside him. Opposition thus breaks out in his own self; it has this twofold nature, it is a process or movement of consciousness, and it is the fixed being of a reality with a phenomenal character, a reality which in it is directly its own. This being, the "body" of the determinate individuality, is its original source, that in the making of which it has had nothing to do. But since the individual at the same time merely is what he has done, his body is also an "expression" of himself which he has brought about; a sign and indication as well, which has not remained a bare immediate fact, but through which the individual only makes known what is actually implied by his setting his original nature to work.

If we consider the moments we have here in relation to the view previously indicated, we find a general human shape and form, or at least the general character of a climate, of a portion of the world, of a people, just as formerly we found in the same way general customs and culture. In addition the particular circumstances and situation are within the universal reality; here this particular reality is a particular formation of the shape of the individual. On the other side, whereas formerly we were dealing with the free activity of the individual, and reality in the sense of his own reality was put in contrast and opposition to reality as given, here the shape assumed by the individual stands as an expression of his own actualization established by the individual himself, it bears the lineaments and forms of his spontaneously active being. But the reality, both universal as well as particular, which observation formerly found outside the individual, is here the actual reality of the individual, his connate body; and within this very body the expression due to his own action appears. From the psychological point of view objective reality in and for itself and determinate individuality had to be brought into relation to one another; here, however, it is the whole determinate individuality that is the object for observation, and each aspect of the opposition it entails is itself this whole. Thus, to the outer whole belongs not merely the original primordial being, the connate body, but the formation of the body as well, which is due to activity from the inner side; the body is a unity of unformed and formed existence, and is the reality of the individual permeated by his reference to self. This whole embraces the definite parts fixed originally and from the first, and also the lineaments which arise only as the result of action; this whole so formed is, and this being is an expression of what is inner, of the individual constituted as a consciousness and as a process.

This inner is, too, no longer formal, spontaneous activity without any content or determinateness of its own, an activity With its content and

specific nature, as in the former case, lying in external circumstances; it is an original inherently determinate *Character*, whose form alone is the activity. What, then, we have to consider here is the relation subsisting between the two sides; the point to observe is how this relation is determined, and what is to be understood by the inner finding expression in the outer.

This outer, in the first place, does not act as an organ making the inner visible, or, in general terms, a being for another; for the inner, so far as it is in the organ, is the activity itself. The mouth that speaks, the hand that works, with the legs too, if we care to add them, are the operative organs effecting the actual realization, and they contain the action *qua* action, or the inner as such; the externality, however, which the inner obtains by their means is the deed, the act, in the sense of a reality separated and cut off from the individual. Language and labour are outer expressions in which the individual no longer retains possession of himself *per se*, but lets the inner get right outside him, and surrenders it to something else. For that reason we might just as truly say that these outer expressions express the inner too much as that they do so too little: too much — because the inner itself breaks out in them, and there remains no opposition between them and it; they not merely give an *expression of* the inner, they give the inner itself directly and immediately: too little — because in speech and action the inner turns itself into something else, into an other, and thereby puts itself at the mercy of the element of change, which transforms the spoken word and the accomplished act, and makes something else out of them than they are in and for themselves as actions of a particular determinate individual. Not only do the products of actions, owing to this externality, lose by the influence of others the character of being something constant vis-à-vis other individualities; but by their assuming towards the inner which they contain, the attitude of something external, separate, independent, and indifferent,

they can, through the individual himself, be *qua* inner something other than they seem. Either the individual intentionally makes them in appearance something else than they are in truth; or he is too incompetent to give himself the outer aspect be really wanted, and to give them such fixity and permanence that the product of his action cannot become misrepresented by others. The action, then, in the form of a completed product has the double and opposite significance of being either the inner individuality and not its expression; or, *qua* external, a reality detached from the inner, a reality which is something quite different from the inner. On account of this ambiguity, we must look about for the inner as it still is within the individual himself, but in a visible or external form. In the organ, however, it exists merely as immediate activity as such, which attains its externalization in the act or deed, that either does or again does not represent the inner. The organ, in the light of this opposition, thus does not afford the expression which is sought.

If now the external shape and form were able to express the inner individuality only in so far as that shape is neither an organ nor action, hence only in so far as it is an inert passive whole, it would then play the rôle of a subsistent thing, which received undisturbed the inner as an alien element into its own passive being, and thereby became the sign and symbol of it — an external contingent expression, whose actual concrete aspect has no meaning of its own — a language whose sounds and tone-combinations are not the real fact itself, but are capriciously connected with it and a mere accident so far as it is concerned.

Such a capricious association of factors that are external for one another does not give a law. *Physiognomy*, however, would claim distinction from other spurious arts and unwholesome studies on the ground that in dealing with determinate individuality it considers the *necessary* opposition of an inner and an outer, of character as a conscious nature and character as a

definitely embodied organic shape, and relates these moments to one another in the way they are related to one another by their very conception, and hence must constitute the content of a law. In astrology, on the other hand, in palmistry and similar “sciences”, there appears merely external element related to external element, anything whatsoever to an element alien to it. A given constellation at birth, and, when the external element is brought closer to the body itself, certain given lines on the hand, are external factors making for long or short life, and the fate in general of the particular person. Being externalities they are indifferent towards one another, and have none of the necessity for one another which is supposed to lie in the relation of what is outer to what is inner.

The hand, to be sure, does not seem to be such a very external thing for fate; it seems rather to stand to it as something inner. For fate again is also merely the phenomenal manifestation of what the specifically determinate individuality inherently is as having originally an inner determinate constitution. Now to find out what this individuality is in itself, the palmist, as well as the physiognomist, takes a shorter cut than, e.g., Solon, who thought he could only know this from and after the course of the whole life: the latter looked at the phenomenal explicit reality, while the former considers the implicit nature (*das Ansich*). That the band, however, must exhibit and reveal the inherent nature of individuality as regards its fate, is easily seen from the fact that after the organ of speech it is the hand most of all by which a man actualizes and manifests himself. It is the animated artificer of his fortune: we may say of the band it *is* what a man does, for in it as the effective organ of his self-fulfilment he is there present as the animating soul; and since he is ultimately and originally his own fate, the hand will thus express this innate inherent nature.

From this peculiarity, that the organ of activity is at once a form of being and the operation going on within it, or again that the inner inherent being is

itself explicitly present in it and has a being for others, we come upon a further aspect of it different from the preceding. For if the organs in general proved to be incapable of being taken as expressions of the inner for the reason that in them the action is present as a process, while the action as a deed or (finished) act is merely external, and inner and outer in this way fall apart and are or can be alien to one another, the organ must, in view of the peculiarity now considered, be again taken as also a middle term for both, since this very fact, that the operation takes place and is present in it, constitutes *eo ipso* an external attribute of it, and indeed one that is different from the deed or act; for the former holds by the individual and remains with him.

This mediating term uniting inner and outer is in the first place itself external too. But then this externality is at the same time taken up into the inner; it stands in the form of simple unbroken externality opposed to dispersed externality, which either is a single performance or condition contingent for the individuality as a whole, or else, in the form of a total externality, is fate or destiny, split up into a plurality of performances and conditions. The simple lines of the hand, then, the ring and compass of the voice, as also the individual peculiarity of the language used: or again this idiosyncracy of language, as expressed where the hand gives it more durable existence than the voice can do, viz. in writing, especially in the particular style of "handwriting" — all this is an expression of the inner, so that, as against the multifarious externality of action and fate, this expression again stands in the position of simple externality, plays the part of an inner in relation to the externality of action and fate. Thus, then, if at first the specific nature and innate peculiarity of the individual along with what these become as the result of cultivation and development, are regarded as the inner reality, as the essence of action and of fate, this inner being finds its appearance in external fashion to begin with in his mouth,

hand, voice, handwriting, and the other organs and their permanent characteristics. Thereafter and not till then does it give itself further outward expression in its realization in the world.

Now because this middle term assumes the nature of an outer expression, which is at the same time taken back into the inner, its existence is not confined to the immediate organ of action (the hand); this middle term is rather the movement and form of countenance and figure in general which perform no outward act. These lineaments and their movements on this principle are the checked and restrained action that stops in the individual and, as regards his relation to what he actually does, constitute his own personal inspection and observation of the action-outer expression in the sense of reflexion upon the actual outer expression.

The individual, on the occasion of his external action, is therefore not dumb and silent, because he is thereby at once reflected into himself, and he gives articulate expression to this self-reflexion. This theoretical action, the individual's conversing with himself on the matter, is also perceptible to others, for his speaking is itself an outer expression.

In this inner, then, which in being expressed remains an inner, observation finds the individual reflected out of his actual reality; and we have to see how the case stands with regard to the necessity which lies in the unity here.

His being thus reflected is to begin with different from the act itself, and therefore can *be*, and be taken for something other than the deed is. We look at a man's face and see whether he is in earnest with what he says or does. Conversely, however, what is here intended to be an expression of the inner is at the same time an existent objective expression, and hence itself falls to the level of mere existence, which is absolutely contingent for the self-conscious individual. It is therefore no doubt an expression, but at the same time only in the sense of a sign, so that to the content expressed the peculiar

nature of that by which it is expressed is completely indifferent. The inner in thus appearing is doubtless an invisible made visible, but without being itself united to this appearance. It can just as well make use of some other appearance as another inner can adopt the same appearance. Lichtenberg, therefore, is right in saying: "Suppose the physiognomist ever did have a man in his grasp, it would merely require a courageous resolution on the man's part to make himself again incomprehensible for centuries."

In the previous case the immediately given circumstances formed a sphere of existence from which individuality selected what it could or what it wanted, either submitting to or transmuting this given existence, for which reason this did not contain the necessity and inner nature of individuality. Similarly here the immediate being in which individuality clothes its appearance is one which either expresses the fact of its being reflected back out of reality and existing within itself, or which is for it merely a sign indifferent to what is signified, and therefore signifying in reality nothing; it is as much its countenance as its mask, which can be put off when it likes. Individuality permeates its own shape, moves, speaks in the shape assumed; but this entire mode of existence equally well passes over into a state of being indifferent to the will and the act. Individuality effaces from it the significance it formerly had — of being that wherein individuality is reflected into itself, or has its true nature — and instead puts its real nature rather in the will and the deed.

Individuality abandons that condition of being reflected into self which finds expression in lines and lineaments, and places its real nature in the work done. Herein it contradicts the relationship which the instinct of reason, engaged in observing self-conscious individuality, establishes in regard to what its inner and outer should be. This point of view brings us to the special idea at the basis of the science of physiognomy-if we care to call it a "science". The opposition this form of observation comes upon is in

form the opposition of practical and theoretical, both falling inside the practical aspect itself — the opposition of individuality, making itself real in action (in the most general sense of action), and individuality as being in this action at the same time reflected thence into self, and taking the action for its object. Observation apprehends and accepts this opposition in the same inverted form in which it is when it makes its appearance. To observation, the deed itself and the performance, whether it be that of speech or a more solid reality, stand for the nonessential outer, while the individuality's existence within itself passes for the essential inner. Of the two aspects which the practical mind involves, intention and act (the "meaning" regarding the action and the action itself), observation selects the former as the true inner; this (i.e. the intention or true inner) is supposed to have its more or less unessential externalization in the act, while its true outer expression is to be had in the form in which the individual is embodied. This latter expression is a sensuous immediate presence of the individual mind: the inwardness, which is intended to be the true internal aspect, is the particular point of the intention, and the singleness of self-existence: both together the mind subjectively "meant" Thus, what observation takes for its objects is an existence that is "meant"; and within this sphere it looks for laws.

The primary way of making conjectures (*meinen*) regarding the "presumptive" presence of mind is everyday (natürlich) physiognomy, hasty judgment formed at a glance about the inner nature and the character of its outer form and shape. The object of this guesswork thinking is of such a kind that its very essence involves its being in truth something else than merely sensuous and immediate. Certainly what is really present is just this condition of being in sensuous form reflected out of sense into self; it is the visible as a sensuous presentment of the invisible, which constitutes the object of observation. But this very sensuous immediate presence is the

mind's reality" as that reality is approved by mere conjecture (*Meinung*); and observation from this point of view occupies itself with its "presumed" (*gemeint*) existence, with physiognomy, handwriting, sound of voice, etc.

Observation relates such and such a sensuous fact to just such a supposed or presumed (gemeintes) inner. It is not the murderer, the thief, that is to be known; it is the capacity to be a murderer, a thief. The definitely marked abstract attribute is thereby lost in the concrete indefinite characteristic nature of the particular individual, which now demands more skilful delineations than the former qualifications supply. Such skilful delineations no doubt say more than the qualification, "murderer", "thief", or "good-hearted", "unspoiled", and so on; but are a long way short of their aim, which is to express the being that is "meant", the single individuality; as far short as the delineations of the form and shape, which go further than a "flat brow", a "long nose", etc. For the individual shape and form, like the individual self-consciousness, is *qua* something "meant", inexpressible. The "science of knowing men", which is concerned about the supposed human being, like the "science" of physiognomy, which deals with his presumed reality and seeks to raise to the level of knowledge uncritical assertions of everyday (*natürlich*) physiognomy, is therefore something with neither foundation nor finality; it cannot manage to say what it "means" because it merely "means", and its content is merely what is "presumed" or "meant".

The so-called "laws", this kind of science sets out to find, are relations holding between these two presumed or supposed aspects, and hence can amount to no more than an empty "fancying" (*meinen*). Again since this presumed knowledge, which takes upon itself to deal with the reality of mind, finds its object to be just the fact that mind is reflected from sense existence back into self, and that, for mind, a specific bodily expression is an indifferent accident, it is therefore bound to be aware at once that by the so-called "laws" discovered it really says nothing at all, but that, strictly

speaking, this is mere chatter, or merely giving out a "fancy" or "opinion" (*Meinung*) of its own — (an assertion which has this amount of truth that to state one's "opinion", one's "fancy", and not to convey thereby the fact itself, but merely a "fancy of one's own", are one and the same thing). In content, however, such observations cannot differ in value from these: "It always rains at our annual fair, says the dealer; "And every time, too," says the housewife, "when I am drying my washing."

Lichtenberg, who characterizes physiognomic observation in this way, adds this remark: "If any one said, 'You act, certainly, like an honest man, but I can see from your face you are forcing yourself to do so, and are a rogue at heart,' without a doubt every brave fellow to the end of time when accosted in that fashion will retort with a box on the ear."

This retort is to the point, for the reason that it refutes the fundamental assumption of such a "science" of conjecture (*meinen*), viz. that the reality of a man is his face, etc.

The true being of a man is, on the contrary, his act; individuality is real in the deed, and a deed it is which cancels both the aspects of what is "meant" or "presumed" to be. In the one aspect where what is "presumed" or "imagined" takes the form of a passive bodily being, individuality puts itself forward in action as the negative essence which only *is* so far as it cancels *bring*. Then furthermore the act does away with the inexpressibleness of what self-conscious individuality really "means"; in regard to such "meaning", individuality is endlessly determined and determinable. This false infinite, this endless determining, is abolished in the completed act. The act is something simply determinate, universal, to be grasped as an abstract, distinctive whole; it is murder, theft, a benefit, a deed of bravery, and so on, and what it is can be *said* of it. It *is* such and such, and its being is not merely a symbol, it is the fact itself. It *is* this, and the individual human being *is* what the *act is*. In the simple fact that the act

is, the individual is for others what he really is and with a certain general nature, and ceases to be merely something that is “meant” or “presumed” to be this or that. No doubt he is not put there in the form of mind; but when it is a question of his being *qua* being, and the twofold being of bodily shape and act are pitted against one another, each claiming to be his true reality, the deed alone, is to be affirmed as his genuine being — not his figure or shape, which would express what he “means” to convey by his acts, or what any one might “conjecture” he merely could do. In the same way, on the other hand, when his performance and his inner possibility, capacity, or intention are opposed, the former *alone* is to be regarded as his true reality, even if he deceives himself on the point and, after he has turned from his action into himself,. means to be something else in his “inner mind” than what he is in the act. Individuality, which commits itself to the objective element, when it passes over into a deed no doubt puts itself to the risk of being altered and perverted. But what settles the character of the act is just this — whether the deed is a real thing that holds together, or whether it is merely a pretended or “supposed” performance, which is in itself null and void and passes away. Objectification does not alter the act itself; it merely shows what the deed *is,* i.e. whether it *is* or whether it is *nothing*.

The breaking up of this real being into intentions, and subtleties of that sort, by which the real man, i.e. his deed, is to be reduced again to, and explained in terms of, a “conjectured” being, as even the individual himself may produce out of himself particular intentions concerning his reality — all this must be left to idle “fancying and presuming” to furnish at its leisure. If this idle thinking *will* set its ineffective wisdom to work, and *will* deny the agent the character of reason, and use him so badly as to want to declare his figure and his lineaments to be his real being instead of his act, then it may expect to get the retort above spoken of, a retort which shows

that figure is not the inherent being, but is on the contrary an object sufficiently on the surface to be roughly handled.

If we look now at the range of relations as a whole in which self-conscious individuality can be observed standing towards its outer aspect, there will be one left which has still to come before observation as an object. In psychology it is the external reality of things which in the life of mind is to have its counterpart conscious of itself and make the mind intelligible. In physiognomy, on the other hand, mind or spirit is to be known in its own proper outer (physical) aspect, a form of being which may be called the language or utterance of mind — the visible invisibility of its inner nature. There is still left the further character of the aspect of reality — that individuality expresses its nature in its immediate actuality, an actuality that is definitely fixed and purely existent.

This last relation [of mind to its reality] is distinguished from the physiognomic by the fact that this is the speaking presence of the individual, who in his practical active outer expression brings to light and manifests at the same time the expression wherein he reflects himself into himself and contemplates himself, an expression which is itself a movement, passive lineaments which are themselves essentially a mediated form of existence. In the character still to be considered, however, the outer, element is finally an entirely inactive objectivity, which is not in itself a speaking sign, but presents itself on its own account, separate from the self-conscious process, and has the form of a bare thing.

In the first place in regard to the relation of the inner to this its outer, it is clear that that relation seems bound to be understood in the sense of a causal connexion, since the relation of one immanent and inherent entity to another, *qua* a necessary relation, is causal connexion.

Now, for spiritual individuality to have an effect on the body it must *qua* cause be itself corporeal. The corporeal element, however, wherein it acts as

a cause, is the organ, not the organ of action on external reality, but of the action of the self-conscious being within itself, operating outward only on its own body. It is at the same time not easy to see what these organs can be. If we merely think of organs in general, the general organ for work would at once occur to us, so, too, the organ of sex, and so on. But organs of that sort are to be considered as instruments or parts, which mind, *qua* one extreme, possesses as a means for dealing with the other extreme, which is an outer object. In the present case, however, an organ is to be understood to be one wherein the self-conscious individual, as an extreme, maintains himself on his own account and for himself against his *own* proper actuality which is opposed to him, the individual not being at the same time turned upon the outer world, but reflected in his own action, and where, further, his aspect of existence is not an existence objective for some other individual. In the case of physiognomy, too, the organ is no doubt considered as an existence reflected into self and criticizing the action. But in this case the existence is objective in character, and the outcome of the physiognomical observation is that self-consciousness treats precisely this its reality as something indifferent. This indifference disappears in the fact that this very state of being reflected into self is itself active upon the other: thereby that existence occupies and maintains a necessary relation to self-consciousness. But to operate effectually on that existence it must itself have a being, though not properly speaking an objective being, and it must be set forth as being this organ.

In ordinary life, anger, e.g. as an internal action of that sort, is located in the liver. Plato even assigns the liver something still higher, something which to many is even the highest function of all, viz. prophesying, or the gift of uttering in an irrational manner things sacred and eternal. But the process which the individual has in his liver, heart, and so on, cannot be regarded as one wholly internal to the individual, wholly reflected into his

self; rather his process is there (viz. in the liver, etc.) as something which has already become bodily and assumes a physical animal existence, reacting on and towards external reality.

The nervous system, on the other hand, is the immediate stability of the organism in its process of movement. The nerves themselves, no doubt, are again organs of that consciousness which from the first is immersed in its outward impulses. Brain and spinal cord, however, may be looked at as the immediate presence of self-consciousness, a presence self-contained, not an object and also not transient. In so far as the moment of being, which this organ has, is a being for another, is an objective existence, it is a being that is dead, and is no longer the presence of self-consciousness. This self-contained existence, however, is by its very nature a fluent stream, wherein the circles that are made in it immediately break up and dissolve, and where no distinction is expressed as permanent or real. Meanwhile, as mind itself is not an abstractly simple entity, but a system of processes, wherein it distinguishes itself into moments, but in the very act of distinguishing remains free and detached; and as mind articulates its body as a whole into a variety of functions, and designates one particular part of the body for only one function: — so too one can represent to oneself the fluent state of its internal existence [its existence within itself] as something that is articulated into parts. Moreover, it seems bound to be thought of in this way, because the self-reflected being of mind in the brain itself is again merely a middle term between its pure essential nature and its bodily articulation, an intermediate link, which consequently must partake of the nature of both, and thus in respect of the latter must also again have in it actual articulation.

The psycho-organic being has at the same time the necessary aspect of a stable subsistent existence. The former must retire, *qua* extreme of self-existence, and have this latter as the other extreme over against it, an extreme which is then the object on which the former acts as a cause. If now

brain and spinal cord are that bodily self-existence of mind, the skull and vertebral column form the other extreme separated off, viz. the solid fixed stable thing.

When, however, any one thinks of the proper place where mind exists, it is not the back that occurs to him, but merely the head. Since this is so, we can, in examining a form of knowledge like what we are at present dealing with, content ourselves with this reason — not a very bad one in the present case — in order to confine the existence of mind to the skull. Should it strike any one to take the vertebral column for the seat of mind, in so far as by it too knowledge and action doubtless are sometimes partly induced and partly educed, this would prove nothing in defence of the view that the spinal cord must be taken as well for the indwelling seat of mind, and the vertebral column for the existential counterpart, because this proves too much. For we may bear in mind that there are also other approved external ways for getting at the activity of mind in order to stimulate or inhibit its activity.

The vertebral column, then, if we like, drops rightly out of account; and it is as well made out as many another doctrine of the philosophy of nature that the skull alone does not indeed contain the "organs" of mind (but its existent embodiment). For this was previously excluded from the conception of this relation, and on that account the skull was taken for the aspect of existence; or, if we may not be allowed to recall the conception involved, then experience unquestionably teaches that, as we see with the eye qua organ, so it is not with the skull that we commit murder, steal, write poetry, etc.

We must on that account refrain from using the expression "organ" also when speaking of that significance of the skull which we have still to mention. For although it is a common thing to hear people say, that to reasonable men it is not words but facts that really matter, yet that does not

give us permission to describe a thing in terms not appropriate to it. For this is at once stupidity and deceit, pretending merely not to have the right “word”, and biding from itself that in reality it has not got hold of the fact itself, the notion. If the latter were there, it would soon find the right word.

What has been here determined is, in the first instance, merely that just as the brain is the *caput vivum*, the skull is the *caput mortuum*.

It is in this *ens mortuum*, then, that the mental processes and specific functions of the brain would have to find their external reality manifested, a reality which is none the less in the individual himself. For the relation of those processes and functions to what, being an *ens mortuum*, does not contain mind indwelling within it, there is offered, in the first instance, the external and mechanical relation defined above, so that the organs proper — and these are in the brain — here press the skull out round, there make it broad, or force it flat, or in whatever way we care to state the effect thus exerted. Being itself a part of the organism, it must be supposed to have in it too, as is the case in every bone, an active, living, formative influence, so that, from this point of view, it really, from its side, presses the brain, and fixes its external boundary — which it is the better able to do being the harder. In that case, however, the relation of the activity of the one to the other would always maintain the same character; for whether the skull is the determining factor or the factor determined, this would effect no alteration in the general causal connexion, only that the skull would then be made the immediate organ of self-consciousness, because in it *qua* cause the aspect of existence-for-self would find expression. But, since self-existence in the sense of organic living activity belongs to both in the same manner, the causal connexion between them in point of fact drops altogether.

This development of the two, however, would be inwardly connected, and would be an organic pre-established harmony, which leaves the two interrelated aspects free as regards one another, each with its own proper

form and shape, without this shape needing to correspond to that of the other; and still more so as regards the relation of the shape and the quality — just as the form of the grape and the taste of wine are mutually independent of one another.

Since, however, the character of self-existence appertains to the aspect of brain, while that of existence to the feature of skull, there is *also* a causal connexion to be set up between them inside the organic unity — a necessary relation between them as external for one another, i.e. a relation itself external, whereby their form and shape are determined the one through the other.

As regards the condition, however, in which the organ of self-consciousness would operate causally on the opposite aspect, all sorts of statements can be made. For the question concerns the constitution of a cause which is considered in regard to its indifferent existence, its shape and quantity, a cause whose inner nature and self-existence are to be precisely what leave quite unaffected the immediately existing aspect. The organic self-formation of the skull is, to begin with, indifferent to the mechanical influence exerted, and the relationship in which these two processes stand, since the former consists in relating itself to itself, is just this very indeterminateness and boundlessness. Furthermore, even though the brain accepted the distinctions of mind, and took them into itself as existential distinctions, and were a plurality of inner organs occupying each a different space, it would be left undecided whether a mental element would, according as it was originally stronger or weaker, either be bound to possess in the first case a more expanded brain-organ, or in the latter case a more contracted brain-organ, or just the other way about. But it is contradictory to nature for the brain to be such a plurality of internal organs; for nature gives the moments of the notion an existence of their own, and hence puts the fluent simplicity of organic life clear on one side, and its articulation and

division with its distinctions on the other, so that, in the way they have to be taken here, they assume the form of particular anatomical facts.

The same holds good in regard to the question whether the improvement of the brain would enlarge or diminish the organ, whether it would make it coarser and thicker or finer. By the fact that it remains undetermined how the cause is constituted, it is left in the same way undecided bow the effect exerted on the skull comes about, whether it is a widening or a narrowing and shrinking of it. Suppose this effect is named in perhaps more distinguished phrase a “solicitation”, we cannot say whether this takes place by swelling like the action of a cantharides-plaster, or by shrivelling like the action of vinegar.

In defence of all views of that kind plausible reasons can be adduced; for the organic relation, which quite as much exerts its influence, finds one fit as well as another, and is indifferent to all this wit of mere understanding.

It is, however, not the interest of observation to seek to determine this relation. For it is in any case not the brain in the sense of a physical part which takes its stand on one side, but brain in the sense of the existential form of self-conscious individuality. This individuality, *qua* abiding character and self-moving conscious activity, exists for itself and within itself. Opposed to this existence within itself and on its own account stand its reality and its existence for another. Its own peculiar existence is the essential nature, and is subject, having a being in the brain; this being is subsumed under it, and gets its value merely through its indwelling significance. The other aspect of self-conscious individuality, however, that of its existence, is being *qua* independent and subject, or *qua* a thing, viz. a bone: the real existence of man is his skull-bone. This is the relationship and the sense which the two aspects of this relation have when the mind adopts the attitude of observation.

Observation has now to deal with the more determinate relation of these aspects. The skull-bone doubtless in general has the significance of being the immediate reality of mind. But the many-sidedness of mind gives its existence a corresponding variety of meanings. What we have to find out is the specific meaning of the particular regions into which this existence is divided; and we have to see how the reference to mind is denoted in them.

The skull-bone is not an organ of activity, nor even a process of utterance. We neither commit theft, murder, etc., with the skull-bone, nor does it in the least distort its face to suit the deed in such cases, so that the skull should express the meaning in the language of gesture. Nor does this existential form possess the value even of a symbol. Look and gesture, tone, even a pillar or a post stuck up on a desert island, proclaim at once that they stand for something else than what they merely are at first sight. They forthwith profess to be symbols, since they have in them a characteristic which points to something else by the fact that it does not belong peculiarly to them. Doubtless, even in the case of a skull, there is many an idea that may occur to us, like those of Hamlet over Yorick's skull; but the skull-bone by itself is such an indifferent object, such an innocent thing, that there is nothing else to be seen in it or to be thought about it directly as it is, except simply the fact of its being a skull. It no doubt reminds us of the brain and its specific nature, and skull with other formations, but it does not recall a conscious process, since there is impressed on it neither a look or gesture, nor anything which would show traces of derivation from a conscious activity. For it is that sort of reality which, in the case of individuality, is intended to exhibit an aspect of another kind, one that would no longer be an existence reflecting itself into itself, but bare immediate existence.

While, further, the skull does not itself feel, there seems still a possibility of providing it with a more determinate significance in the fact that specific

feelings might enable us, through their being in proximity to it, to find out what the skull may mean to convey; and when a conscious mode of mind has its feeling in a specific region of the skull, it may be thought perhaps that this spot of the skull may indicate by its shape what that mode is and what its peculiar nature. Just as, e.g., many people complain of feeling a painful tension somewhere in the head when thinking intensely, or even when thinking at all, so it might be that stealing, committing murder, writing poetry, and so on, could each be accompanied with its own proper feeling, which would over and above be bound to have its peculiar localization. This locality of the brain, which would in this manner be more disturbed and exercised, would also most likely develop further the contiguous locality of the bone of the skull; or again this latter locality would, from sympathy or conformity, not be inert, but would enlarge or diminish or in some other way assume a corresponding form.

What, however, makes such a hypothesis improbable is this: feeling in general is something indeterminate, and that feeling in the head as the centre might well be the general feeling that accompanies all suffering; so that mixed up with the thief's, murderer's, poet's tickling or pain in the head there would be other feelings too, and they would permit of being distinguished from one another, or from those we may call merely bodily feelings, as little as an illness can be determined from the symptom of headache, if we restrict its meaning merely to the bodily element.

In point of fact, from whatever side we look at the matter, all necessary reciprocal relation between them comes to nothing, as well as any intimation the one might give of the other in virtue of such a relation. If the relation is still to hold, what is left to form a sort of necessary relation is a pre-established harmony of the corresponding features of the two sides, a harmony which leaves the factors in question quite detached and rests on no

inherent principle; for one of the aspects has to be a non-mental reality, a bare thing.

Thus then, on one side we have a number of passive regions of the skull, on the other a number of mental properties, the variety and character of which will depend on the condition of psychological investigation. The poorer the idea we have of mind, the easier the matter becomes in this respect; for, in part, the fewer become the mental properties, and, in part, the more detached, fixed, and ossified, and consequently more akin to features of the bone and more comparable with them. But, while much is doubtless made easier by this miserable representation of the mind, there still remains a very great deal to be found on both sides: there remains for observation to deal with the entire contingency of their relation. When every faculty of the soul, every passion and (for this, too, must be considered here) the various shades of characters, which the more refined psychology and "knowledge of mankind" are accustomed to talk about, are each and all assigned their place on the skull, and their contour on the skull-bone, the arbitrariness and artificiality of this procedure are just as glaring as if the children of Israel, who had been likened to "the sand by the seashore for multitude", had each assigned and taken to himself his own symbolic grain of sand!

The skull of a murderer has — not this organ or sign — but this "bump". But this murderer has in addition a lot of other properties, and other bumps too, and along with the bumps hollows as well. Bumps and hollows, there is room for selection! And again his murderous propensity can be referred to any bump or hollow, and this in turn to any mental quality; for the murderer is neither this abstraction of a murderer, nor does he have merely one protuberance and one depression. The observations offered on this point must therefore sound just about as sensible as those of the dealer about the rain at the annual fair, and of the housewife at her washing time. Dealer and

housewife might as well make the observation that it always rains when neighbour so-and-so passes by, or when they have roast pork. From the point of view of observation a given characteristic of mind is just as indifferent to a given formation of the skull as rain is indifferent to circumstances like these. For of the two objects thus under observation, the one is a barren isolated entity (*Fürsichsein*), an ossified property of mind, the other is an equally barren potentiality (*Ansichsein*). Such an ossified entity, as they both are, is completely indifferent to everything else. It is just as much a matter of indifference to a high bump whether a murderer is in close proximity, as to the murderer whether flatness is near him.

There is, of course, no getting over the *possibility* that still remains, that a bump at a certain place is connected with a certain property, passion, etc. We can think of the murderer with a high bump here at this place on the skull, the thief with one there. From this point of view phrenology is capable of much greater extension than it has yet had. For in the first instance it seems to be restricted merely to the connexion of a bump with a property in one and the same individual, in the sense that this individual possesses both. But phrenology *per naturam* — for there must be such a subject as well as a physiognomy *per naturam* — goes a long way beyond this restriction. It does not merely affirm that a cunning fellow has a bump like a fist lying behind the ear, but also puts forward the view that, not the unfaithful wife herself, but the other party to this conjugal transaction, has a bump on the brow.

In the same way, too, one may imagine the man living living under the same roof with the murderer, or even his neighbour, or, going still further afield, imagine his fellow-citizens, etc., with high bumps on some part of the skull, just as well as one may picture to oneself the flying cow, that was first caressed by the crab riding on a donkey, and afterwards, etc., etc. But if possibility is taken not in the sense of a possibility of "imagining" but in the

sense of *inner* possibility or possibility of *conceiving*, then the object is a reality of the kind which is a mere thing and is, and should be, deprived of a significance of this sort, and can thus only have it for imaginative or figurative thinking.

The observer may, in spite of the indifference of the two sides to one another, set to work to determine correlations, supported partly by the general rational principle that the outer is the expression of the inner, and partly by the analogy of the skulls of animals — which may doubtless have a simpler character than men, but of which at the same time it becomes just so much the more difficult to say what character they do have, in that it cannot be so easy for any man's imagination to think himself really into the nature of an animal. Should the observer do so, he will find, in giving out for certain the laws he maintains he has discovered, a first-rate means of assistance in a distinction which we too must necessarily take note of at this point.

The being of mind cannot be taken at any rate to be something completely rigid and immovable. Man is free. It will be admitted that the mind's original primordial being consists merely in *dispositions,* which mind has to a large extent under its control, or which require favourable circumstances to draw them out; i.e. an original "being" of mind must be equally well spoken of as what does not exist as a "being" at all. Were observations to conflict with what strikes any one as a warrantable law, should it happen to be fine weather at the annual fair or on the housewife's washing day — then dealer and housewife might say that it, properly speaking, should rain, and the conditions are really all that way. So too in the case of observing the skull, it might be said when those contradictory observations occur, that the given individual ought properly to be what according to the law his skull proclaims him to be, and that he has an original disposition which, however, has not been developed: this quality is

not really present, but it *should* be there. The “law” and the “ought-to-be” rest on observation of actual showers of rain, and observation of the actual sense and meaning in the case of the given character of the skull; but if the *reality* is not present, the empty possibility is supposed to do just as well.

This mere possibility, i.e. the non-actuality of the law proposed, and hence the observations conflicting with the law, are bound to come out just for the reason that the freedom of the individual and the developing circumstances are indifferent towards what merely *is*, both in the sense of the original inner as well as the external ossiform structure, and also because the individual can be something else than he is in his original internal nature, and still more than what he is as a skull-bone.

We get, then, the possibility that a given bump or hollow on the skull may denote both something actual as well as a mere disposition, one indeed so little determined in any given direction as to denote something that is not actual at all. We see here, as always, the same result of a bad excuse, viz. that it is itself ready to be used *against* what it is intended to support. We see the thinking that merely “conjectures” brought by the very force of facts to say in unintelligent fashion the very opposite of what it holds to — to say that there is something indicated by such and such a bone, but also just as truly not indicated at all.

What hovers before this way of “conjecturing” when it makes this excuse is the true thought-a thought, however, which abolishes that way of “conjecturing” — that being as such is not at all the truth of spirit. As the disposition is an original primordial being, having no share in the activity of mind, just such a being is the skull-bone on its side. What merely *is*, without participating in spiritual activity, is a thing for consciousness, and so little is it the essence of mind that it is rather the very opposite of it, and consciousness is only actual for itself by the negation and abolition of such a being.

From this point of view it must be regarded as a thorough denial of reason to give out a skull-bone as the actual existence of conscious life, and that is what it is given out to be when it is regarded as the outer expression of spirit; for the external expression is just the existent reality. It is no use to say we merely draw an inference from the outer as to the inner, which is something different, or to say that the outer is not the inner itself but merely its expression. For in the relation of the two to one another the character of the reality which thinks itself and is thought of by itself falls just on the side of the inner, while the outer has the character of existent reality.

When, therefore, a man is told, "You (your inner being) are so and so, because your skull-bone is so constituted," this means nothing else than that we regard a bone as the man's reality. To retort upon such a statement with a box on the ear — in the way mentioned above when dealing with psysiognomy — removes primarily the "soft" parts of his head from their apparent dignity and position, and proves merely that *these* are no true inherent nature, are not the reality of mind; the retort here would, properly speaking, have to go the length of breaking the skull of the person who makes a statement like that, in order to demonstrate to him in a manner as palpable as his own wisdom that a bone is nothing of an inherent nature at all for a man., still less his true reality.

The untutored instinct of self-conscious reason will reject without examination phrenology — this other observing instinct of self-conscious reason, which having succeeded in malting a guess at knowledge has grasped knowledge in the soulless form that the outer is an expression of the inner. But the worse the thought, the less sometimes does it strike us where its badness, definitely lies, and the more difficult it is to explain it. For a thought is said to be the worse, the barer and emptier the abstraction, which thought takes to be the essential truth. But in the antithesis here in question the component parts are individuality conscious of itself, and the

abstraction of a bare thing, to which externality has been reduced — the inner being of mind taken in the sense of a fixed soulless existence and in opposition to just such a being.

With the attainment of this, however, rational observation seems in fact to have also reached its culminating point, at which it must take leave of itself and turn right about; for it is only when anything is entirely bad that there is an inherent and immediate necessity in it to wheel round completely into its opposite. Just so it may be said of the Jews that it is precisely because they stand directly before the door of salvation, that they are and have been the most reprobate and abandoned: — what the nation should be in and for itself, this, the true inner nature of its self, it is not conscious of being, but puts away beyond itself. By this renunciation it creates for itself the *possibility* of a higher level of existence, if once it could get the object thus renounced back again to itself, than if it had never left its natural immediate state of existence — because spirit is all the greater the greater the opposition out of which it returns into itself; and such an opposition spirit brings about for itself, by doing away with its immediate unity, and laying aside its self-existence, a separate life of its own. But if such a consciousness does not mediate and reflect itself, the middle position or term where it has a determinate existence is the fatal unholy void, since what should give it substance and filling has been turned into a rigidly fixed extreme. It is thus that this last stage of reason's function of observation is its very worst, and for that reason its complete reversal becomes necessary.

For the survey of the series of relations dealt with up to this point, which constitute the content and object of observation, shows that even in its first form, in observation of the relations of inorganic nature, sensuous being vanished from its ken. The moments of its relation (i.e. that of inorganic nature) present themselves as pure abstractions and as simple notions, which should be kept connected with the existence of things, but this gets

lost, so that the abstract moment proves to be a pure movement and a universal. This free, self-complete process retains the significance of something objective; but now appears as a unit. In the process of the inorganic the unit is the inner with no existence. When the process does have existence *qua* unit, as one and single, it is an organism.

The unit *qua* self-existent or negative entity stands in antithesis to the universal, throws off its control, and remains independent by itself, so that the notion, being only realized in the condition of absolute dissociation, fails to find in organic existence its genuine expression, in the sense that it is not there, in the form of a universal; it remains an "outer", or, what is the same thing, an "inner" of organic nature.

The organic process is merely free implicitly (*an sich*); it is not so explicitly, "for itself" (*für sich*). The explicit phase of its freedom appears in the idea of purpose, has existence as another inner nature as a self-directing wisdom that lies outside that mere process. Reason's function of observation thus turns its attention to this wisdom, to mind, to the notion actually existing as universality, or to the purpose existing in the form of purpose; and what constitutes its own essential nature is now the object before it.

Reason here in the activity of observation is directed first to the pure abstract form of its essential nature. But since reason, in its apprehension of the object thus working and moving amidst its own distinctions takes this object as something that exists, observation becomes aware of laws of thought, relations of one constant factor to another constant factor. The content of these laws being, however, merely moments, they run together into the single one of self-consciousness.

This new object, taken in the same way as existent, is the contingent individual self-consciousness. The process of observation, therefore, keeps within the "conjectured" meaning of mind, and within the contingent

relation of conscious to unconscious reality. Mind alone in itself is the necessity of this relation. Observation, therefore, attacks it at closer quarters, and compares its realization through will and action with its reality when it contemplates and is reflected into itself, a reality which is itself objective. This external aspect, although an utterance of the individual which he himself contains, is at the same time, *qua* symbol, something indifferent to the content which it is intended to denote, just as what finds for itself the symbol is indifferent to this symbol.

For this reason, observation finally passes from this variable form of utterance back to the permanent fixed being, and in principle declares that externality is the outer immediate reality of mind, not in the sense of an organ, and not like a language or a symbol, but in the sense of a lifeless thing. What the very first form of observation of inorganic nature did away with and superseded, viz. the idea that the notion should appear in the shape of a thing, this last form of observation reinstates so as to turn the reality of mind itself into a thing, or expressing it the other way about, so as to give lifeless being the significance of mind.

Observation has thus reached the point of explicitly expressing what our notion of observation was at the outset, viz. that rational certainty means objectivity of reason, that the certainty of reason seeks itself as an objective reality.

One does not, indeed, suppose that mind, which is represented by a skull, is defined as a thing. There is not meant to be any materialism, as it is called, in this idea; mind rather must be something very different from these bones of the skull. But that mind*is*, *means* nothing else than that it is a *thing*. When being as such, or thingness, is predicated of the mind, the true and genuine expression for this is, therefore, that mind is such an entity as a bone is. Hence it must be considered as supremely important that the true expression has been found for the bare statement regarding mind — that it

is. When the statement is ever made about mind, that it *is,* has a being, is a *thing*, an individual reality, we do not *mean* it is something we can see, or knock about, or take in our hands, and so on, but that is what we *say*, and what the statement really amounts to is consequently conveyed in the expression that the existence of mind is a bone.

This result has now a twofold significance: one is its true meaning, in so far as the result is a completion of the outcome of the preceding movement of self-consciousness. The unhappy self-consciousness renounced its independence, and wrested its distinctive self-existence out into the shape of a thing. By doing so, it left the level of self-consciousness and reverted to the condition of mere consciousness, i.e. to that phase of conscious life for which the object is an existent, a thing. But what is "thing" in this case is self-consciousness; "thing" here is the unity of ego and being — the Category. When the object before consciousness is determined thus, consciousness possesses reason. Consciousness, as well as self-consciousness, is in itself properly reason in an implicit form; but only that consciousness can be said to *have* reason whose object has the character of being the category. From this, however, we must still distinguish the knowledge of what reason *is*.

The category, which is the immediate unity of being and self (*Seyn und Seinen*), must traverse both forms, and the conscious attitude of observation is just where the category is set forth in the form of being. In its result, consciousness expresses that, whose unconscious implicit certainty it is, in the shape of a proposition — the proposition which lies in the very notion of reason. This proposition is the infinite judgment that the self is a thing — a judgment that cancels and transcends itself.

Through this result, then, the category gets the added characteristic of being this self-cancelling opposition. The "pure" category, which is present to consciousness in the form of being or immediacy, is still an unmediated,

a merely given object, and the attitude of consciousness is also direct, has no mediation in it. That infinite judgment is the moment which is the transition of immediacy into mediation or negativity. The given present object is therefore characterized as a negative object while consciousness in its relation towards it assumes the form of *self*-consciousness; or the category, which traversed the form of *being* in the process of observation, is now set up in the form of self-existence. Consciousness no longer seeks to find itself immediately, but to produce itself by its own activity. Consciousness itself is the purpose and end of its own action, as in the process of observation it had to do merely with things.

The other meaning of the result is the one already considered, that of unsystematic (*begrifflos*) observation. This has no other way of understanding and expressing itself than by declaring the reality of self-consciousness to consist in the skull-bone, just as it appears in the form of a thing of sense, still retaining its character as an object for consciousness. In stating this, however, it has no clear consciousness as to what the statement involves, and does not grasp the determinate character of the subject and predicate in the proposition and of their relation to one another, still less does it grasp the proposition in the sense of a self-resolving infinite judgment and a notion. Rather, in virtue of a deeper-lying self-consciousness of mind, which has the appearance here of being an innate decency and honesty of nature, it conceals from itself the ignominiousness of such an irrational crude thought a that of taking a bone for the reality of self-consciousness; and the very senselessness of introducing all sorts of relations of cause and effect, symbol", "organ", etc., which are perfectly meaningless here, and of hiding away the glaring folly of the proposition behind distinctions derived from them — all this puts a gloss on that thought and whitewashes its naked absurdity.

Brain-fibres and the like, looked at as forms of the being of mind, are already an imagined, a merely hypothetical actuality of mind — not its presented reality, not its felt, seen, in short not its true reality. If they are present to us, if they are seen, they are lifeless objects, and then no longer pass for the being of mind. But its objectivity proper must take an immediate, a sensuous form, so that in this objectivity *qua* lifeless — for the bone is lifeless so far as the lifeless is found in the living being itself — mind is established as actual.

The principle involved in this idea is that reason claims to be all thinghood, even thinghood of a purely objective kind. It is this, however, *in conceptu*: or, only this notion is the truth of reason; and the purer the notion itself is, the more silly an idea does it become, if its content does not take the shape of a notion (*Begriff*) but of a mere presentation or idea (*Vorstel lung*), if the self-superseding judgment is not taken with the consciousness of this its infinity, but is taken as a stable and permanent proposition, the subject and predicate of which hold good each on its own account, self fixed as self, thing as thing, while one has to be the other all the same.

Reason, essentially the notion, is immediately parted asunder into itself and its opposite, an opposition which just for that reason is immediately again superseded. But if it presents itself in this way as both itself and its opposite, and if it is held fast in the entirely isolated moment of this disintegration, reason is apprehended in an irrational form; and the purer the moments of this opposition are, the more glaring is the appearance of this content, which is either alone for consciousness, or alone expressed ingenuously by consciousness.

The "depth" which mind brings out from within, but carries no further than to make it a presentation (*Vorstellung*), and let it remain at this level — and the "ignorance" on the part of this consciousness as to what it really says, are the same kind of connexion of higher and lower which, in the case

of the living being, nature naïvely expresses when it combines the organ of its highest fulfilment, the organ of generation, with the organ of urination. The infinite judgment *qua* infinite would be the fulfilment of life that comprehends itself, while the consciousness of the infinite judgment that remains at the level of presentation corresponds to urination.

The Realization of Rational Self-Consciousness Through its Own Activity

Translator's comments: In this section we have the second form in which rational experience is realized. In "observation" mind is directly aware of itself as in conscious unity with its object: it makes no effort of its own to realize this unity: it finds the unity by looking on, so to say. But it may have the same experience by creating through its own effort an object constituted and determined solely by its self. Here it does not *find* the unity of itself and its object; it *makes* the object at one with itself by moulding the character and content of the object after its own nature. As contrasted with observation, which may be called the operation of "theoretical" reason, this new way of having a rational experience may be called the operation of "practical" reason. In the first we have reason in the form of knowledge and science, in the second, reason in the sense of rational action and practice.

It is this second way of establishing the experience of reason which is analysed in the following sections. The immediately succeeding section describes the experience in its general features. We have here the sphere of conscious purpose and the foundation of moral and social life.

The Realization of Rational Self-Consciousness Through its Own Activity

SELF-CONSCIOUSNESS found the "thing" in the form of itself, and itself in the form of a thing; that is to say, self-consciousness is explicitly aware of being in itself the objective reality. It is no longer the *immediate*

certainty of being all reality; it is rather a kind of certainty for which the immediate in general assumes the form of something sublated, so that the objectivity of the immediate is regarded now merely as something superficial whose inner core and essence is self-conscious consciousness.

The object, therefore, to which self-consciousness is positively related, is a self-consciousness. The object has the form and character of thinghood, i.e. is independent: but self-consciousness has the conviction that this independent object is not alien to itself; it knows herewith that itself is inherently (*an sich*) recognized by the object. Self-consciousness is mind, which has the assurance of having, in the duplication of its self-consciousness and in the independence of both, its unity with its own self. This certainty has to be brought out now before the mind in all its truth; what self-consciousness holds as a fact, viz. that implicitly *in* itself and in its *inner* certainty it *is,* has to enter into its consciousness and become explicit *for* it.

What the general stages of this actualization will be can be indicated in a general way by reference to the road thus far traversed. Just as reason, when exercised in observation, repeated in the medium of the category the movement of "consciousness" as such, namely, sense-certainty, perception, and understanding, the course of reason here, too, will again traverse the double movement of "self-consciousness", and from independence pass over into its freedom. To begin with, this active reason is aware of itself merely as an individual", and must, being such, demand and bring forth its reality in an "other". Thereafter, however, its consciousness being lifted into universality, it becomes universal reason, and is consciously aware of itself as reason, as something already recognized in and for itself, which within its pure consciousness unites all self-consciousness. It is the simple ultimate spiritual reality (*Wesen*), which, by coming at the same time to consciousness, is the real substance, into which preceding forms return and

in which they find their ground, so that they are, as contrasted with reference to the latter, merely particular moments of the process of its coming into being, moments which indeed break loose and appear as forms on their own account, but have in fact only existence and actuality when borne and supported by it, and only retain their truth in so far as they are and remain in it.

If we take this final result of the process as it is when really accomplished — this end, which is the notion that has already become manifest before us, viz. recognized self-consciousness, which has the certainty of itself in the other free self-consciousness, and finds its truth precisely there; in other words, if we bring this still inward and unevolved mind to light as the substance that has developed into its concrete existence — we shall find that in this notion there is opened up the realm of the Social Order, the Ethical World (*Sittlichkeit*). For this latter is nothing else than the absolute spiritual unity of the essential substance (*Wesen*) of individuals in their independent reality; it is an inherently universal self-consciousness, which is aware of being so concrete and real in an other consciousness, that this latter has complete independence, is looked on as a "thing", and the universal self-consciousness is aware precisely therein of its unity with that "thing", and is only then self-consciousness, when thus in unity with this objective being (*Wesen*). This ethical substance when taken in its abstract universality is only the conception of law, thought-constituted law; but just as much it is immediately actual self-consciousness, it is Custom (*Sitte*). The single individual conversely, is only a "this", a given existent unit, in so far as he is aware of the universal consciousness as his own being in his own particular individuality, seeing that his action and existence are the universal custom.

In point of fact the notion of the realization of self-conscious reason — of directly apprehending complete unity with another in his independence:

of having for my object an other in the fashion of a “thing” found detached and apart from me, and the negative of myself, and of taking this as my own self-existence (*Fürmichseyn*) — finds its complete reality in fulfilment in the life of a nation. Reason appears here as the fluent universal substance, as unchangeable simple thinghood which yet breaks up into many entirely independent beings, just as light bursts asunder into stars as innumerable luminous points, each giving light on its own account, and whose absolute self-existence(*Fürmichseyn*) is dissolved, not merely implicitly (*an sich*), but explicitly for themselves (*für sich*), within the simple independent substance. They are conscious within themselves of being these individual independent beings through the fact that they surrender and sacrifice their particular individuality, and that this universal substance is their soul and essence — as this universal again is the action of themselves as individuals, and is the work and product of their own activity.

The purely particular activity and business of the individual refer to needs which he has as a part of nature, i.e. as a mere existent particular. That even these, its commonest functions, do not come to nothing, but have reality, is brought about by the universal sustaining medium, the might of the entire nation.

It is not merely, however, this *form* of subsistence for his activity in general that the individual gets in the universal substance, but likewise also his *content*; what he does is what all are capable of doing, is the custom all follow. This content, in so far as it is completely particularized, is, in its concrete reality, confined within the limits of the activity of all. The labour of the individual for his own wants is just as much a satisfaction of those of others as of himself, and the satisfaction of his own he attains only by the labour of others.

As the individual in his own particular work *ipso facto* accomplishes unconsciously a universal work, so again he also performs the universal

task as his *conscious* object. The whole becomes *in its entirety* his work, for which he sacrifices himself, and precisely by that means receives back his own self from it.

There is nothing here which may not be reciprocal, nothing in regard to which the independence of the individual may not, in dissipating its existence on its own account (*Fürsichseyn*), in negating itself, give itself its positive significance of existing for itself. This unity of existing for another, or making self a “thing”, and,of existence for self, this universal substance, utters its universal language in the *customs* and *laws* of a nation. But this existent unchangeable nature (*Wesen*) is nothing else than the expression of the particular individuality which seems opposed to it: the laws give expression to that which each individual is and does; the individual knows them not merely to be what constitutes his universal objective nature as a “thing”, but knows himself, too, in that form, or knows it to be particularized in his own individuality and in each of his fellow-citizens. In the universal mind, therefore, each has the certainty only of himself, the certainty of finding in the actual reality nothing but himself; he is as certain of the others as of himself. I apprehend and see in all of them that they are in their own eyes (*für sich selbst*) only these independent beings just as I am. I see in their case the free unity with others in such wise that just as this unity exists through me, so it exists through the others too-I see them as myself, myself as them.

In a free nation, therefore, reason is in truth realized. It is a present living spirit, where the individual not only finds his destiny (*Bestimmung*), i.e. his universal and particular nature (*Wesen*), expressed and given to him in the fashion of a thing, but himself is this essential being, and has also attained his destiny. The wisest men of antiquity for that reason declared that wisdom and virtue consist in living in accordance with the customs of one’s own nation.

From this happy state, however, of having attained its destiny, and of living in it, the self-consciousness, which in the first instance is only immediately and in principle spirit, has broken away; or perhaps it has not yet attained it: for both can be said with equal truth.

Reason must pass out of and leave this happy condition. For only implicitly or immediately is the life of a free nation the real objective ethical order (*Sittlichkeit*). In other words, the latter is an existent social order, and in consequence this universal mind is also an individualized mind. It is the totality of customs and laws of a particular people, a specifically determinate ethical substance, which casts off this limitation only when it reaches the higher moment, namely, when it becomes conscious regarding its own nature; only with this knowledge does it get its absolute truth, and not as it is immediately in its bare existence. In this latter form it is, on the one hand, a restricted ethical substance, on the other, absolute limitation consists just in this that mind is in the form of existence.

Hence, further, the individual, as he immediately finds his existence in the actual objective social order, in the life of his nation, has a solid imperturbable confidence; the universal mind has not for him resolved itself into its abstract moments, and thus, too, he does not think of himself as existing in singleness and independence. When however he has once arrived at this knowledge, as indeed he must, this immediate unity with mind, this undifferentiated existence in the substance of mind, his naive confidence, is lost. Isolated by himself he is himself now the central essential reality — no longer universal mind. The element of this singleness of self-consciousness is no doubt in universal mind itself, but merely as a vanishing quantity, which, as it appears with an existence of its own, is straightway resolved within the universal, and only becomes consciously felt in the form of that confidence. When the individual gets fixity in the form of singleness (and every moment, being a moment of the essential

reality, must manage to reveal itself as essential), the individual has thereby set himself over against the laws and customs. These latter are looked on as merely a thought without absolutely essential significance, an abstract theory without reality; while he *qua* this particular ego is in his own view the living truth.

Or, again [we can say, as above stated, that] self-consciousness has *not yet attained* this happy state of being ethical substance, the spirit of a people. For, after leaving the process of rational Observation, mind, at first, is not yet as such actually realized through itself; it is merely affirmed as inner nature and essence, or as abstraction. In other words, mind is first immediate. As immediately existing, however, it is individualized. It is *practical consciousness,* which steps into the world it finds lying ready-made with the intention of duplicating itself in the determinate form of an individual, of producing itself as this particular individual, and creating this its own existential counterpart, and thus becoming conscious of this unity of its own actual reality with the objective world. Self-consciousness possesses the *certainly* of this unity; it holds that the unity is implicitly (*an sich*) already present, or that this union and agreement between itself and "thinghood" (objective existence) is already an accomplished fact, and has only to become expressly so for it through its own agency; or that its making that unity is at the same time and as much its finding the unity. Since this unity means happiness, the individual is thus sent forth into the world by his own spirit to seek his happiness.

If, then, we for our part find the truth of this rational self-consciousness to be ethical substance, that self-consciousness on its part finds here the beginning of its ethical experience of the world. From the point of view that it has not yet attained to its ethical substance, this movement presses onwards to that end, and what is cancelled in the process are the particular moments which self-consciousness takes as valid in isolation. They have

the form of an immediate will-process, or impulse of nature, which attains its satisfaction, this satisfaction itself being the content of a new impulse. Looking at self-consciousness, however, as having lost the happiness of being in the substance, these natural impulses are bound up with a consciousness that their purpose is the true destiny and essential nature of self-consciousness. Ethical substance has sunk to the level of a floating selfless adjective, whose living subjects are individuals, which have to fill up their universality through themselves, and to provide for their destiny out of the same source.

Taken in the former sense, then, those forms and modes are the process by which the ethical substance comes to be, and precede this substance: in the latter they succeed it, and disclose for self-consciousness what its destined nature is. In the former aspect the immediacy or raw brute impulses get lost in the process of finding out what their truth is, and their content, passes over to a higher. In the latter aspect, however, the false idea of consciousness, which puts its characteristic nature in those impulses, passes to a higher idea. In the former case the goal which they attain is the immediate ethical substance; while, in the latter, the end is the consciousness of that substance, such a consciousness as knows the substance to be its own essential being; and to that extent this process would be the development of morality (*Moralität*), a higher state or attitude than the former (*Sittlichkeit*). But these modes at the same time constitute only one side of the development of morality, that, namely, which belongs to self-existence, or in which consciousness cancels its purposes; they do not constitute the side where morality arises out of the substance itself. Since these moments cannot yet have the signification of being made into purposes in opposition to the lost social order (*Sittlichkeit*),they hold here no doubt in their simple uncriticized content, and the end towards which they work is the ethical substance: but since with our time is more directly

associated that form of these moments in which they appear after consciousness has lost its ethical custom-constituted (*sittliches*) life, and in the search for it repeats those forms, they may be represented more after this latter manner of expression.

Self-consciousness, which is as yet merely the notion of mind, takes this path with the specific characteristic of being to itself the essential reality *qua* individual mind, and its purpose, therefore, is to give itself actualization as individual, and to enjoy itself, *qua* individual, in so doing.

In existing for itself it is aware of itself as the essentially real. In this character it is the negativity of the other. There arises, therefore, within its consciousness an opposition between itself *qua* positive and something which no doubt exists, but *for* it not in the sense of existing substantially. Consciousness appears sundered into this objective reality found lying at its hand, and the purpose, which it carries out by the process of cancelling that objectivity, and which it makes the actual fact instead of the given object. Its primary purpose, however, is its immediate abstract existence for itself, in other words seeing itself as this particular individual in another, or seeing another self-consciousness as itself. The experience of what the truth of this purpose is, places self-consciousness on a higher plane, and henceforth it is to itself purpose, in so far as it is at once universal, and has the law immediately within it. In carrying out this law of its heart, however, it learns that here the individual cannot preserve himself, but rather the good can only be performed through the sacrifice of the individual: and so it passes into *Virtue*. The experience which virtue goes through can be no other than that of finding that its purpose is already implicitly (*an sich*) carried out, that happiness lies immediately in action itself, and action itself is the good. The principle or notion of this entire sphere of experience — viz. that "thinghood" is the independent self-existence of mind — becomes in the course of this experience an objective fact *for* self-consciousness. In

that self-consciousness has found this principle, it is aware of itself as reality in the sense of directly self-expressing *Individuality*, which no longer finds any resistance in a reality opposed to it, and whose object and purpose are merely this function of self-expression.

a

Pleasure and Necessity

Translator's comments: The succeeding three sections discuss the procedure of one-sided subjective individualism — the attempt to realize the individual and yet not transcend the particular individuality. The first thought of self-consciousness when it seeks to realize or objectify itself as a mere individual is to make the objective element return directly to itself and bring a sense of increase of its own individual being or private Pleasure. This is all its interest in the practical realization of its purposes. But the realization of purposes is an expression of the life of reason, and reason means universality and systematic connexion of the content realized. Hence to seek solely private satisfaction or pleasure by a process which is inherently universal is a contradiction in terms. This contradiction the individual discovers in the shape of a sharp and painful contrast between its private feeling of individuation on the one hand and a network of universal connexion on the other-the contrast between "pleasure" and "necessity". Both fall within the individual's experience as a rational agent, and hence this necessity is his own necessity as much as the pleasure is his own pleasure. In the opposition between these factors there is no question as to which must triumph, and which must surrender.

This is the type of experience analysed in the following section. It is an experience that constantly recurs in the life-history of most if not all human beings at one stage or another in their development. The analysis contained

in this section is indirectly a searching criticism of Hedonism in all its forms.

Pleasure and Necessity

SELF-CONSCIOUSNESS, which is aware of being the reality, has its object within itself, but an object which, at first, is merely its own (*für sich*), and is not yet in actual existence. Existence stands opposed to it as a reality other than its own; and the aim of self-consciousness consists in carrying out what it is "for itself" so as to see itself as another independent being. This first purpose is to become conscious, in that other self-consciousness, of itself as an individual, to turn this other into its own self. It has the assurance that this other already is essentially itself.

In so far as it has risen from out of the substance of ethical life and the quiescent state of thought, and attained its conscious independence, it has left behind the law of custom and of substantial existence, the kinds of knowledge acquired through observation, and the sphere of theory; these lie behind it as a gray shadow that is just vanishing. For this latter is rather a knowledge of something, the independent existence (*Fürmichseyn*)and actuality of which are other than those of self-consciousness. It is not the seemingly divine spirit of universality in knowledge and action, wherein (all individual) feeling and enjoyment are stilled, that has passed into and fills this new level of self-consciousness; but the spirit of the earth, a spirit which holds that being alone as true reality which is the reality of individual consciousness.

It repudiates sense and science
The highest gifts possessed by men-
It has gone over to the devil,
And must be o'erthrown

It plunges thus into life, and carries to its completion the pure individuality in which it appears. It does not so much make its own happiness as take it directly and enjoy it. The grey shades of science, laws and principles, which alone stand between it and its own reality, vanish like a lifeless mist that cannot contend against the living certainty of its reality. It takes to itself life much as a ripe fruit is plucked, which comes to meet the hand that takes it

Its action is only in one respect an act of Desire; it does not aim at abolishing the objective fact in its entirety, but only the form of its otherness or objectivity, which is an unreal appearance; for it holds this to be inherently and implicitly the same reality as its own self. The sphere in which desire and its object subsist independently and indifferent towards each other is that of living existence; the enjoyment of desire cancels this existence, so far as it belongs to the object of desire. But here this element, which gives to both separate and distinct actuality, is rather the category, a form of being which has essentially the character of a presented being. It (i.e. the element) is therefore the *consciousness* of independence — it may be natural consciousness, or the consciousness developed into a system of laws — which preserves the individuals each for himself. This separation does not *per se* hold for self-consciousness, which knows the other as its own proper self-hood. It attains therefore to the enjoyment of *Pleasure*, to the consciousness of its actualization in a consciousness which appears as independent, or to the intuition of the unity of both independent self-consciousnesses. It succeeds in its purpose, but only to learn there what the truth of that purpose is. It conceives itself as this individual self-existent (*Fürmichseyn*) being; but the actualization of this purpose is just the cancelling of the purpose. For it comes consciously to be, not object in the sense of a given particular individual, but rather as unity of its self and the

other self-consciousness, consequently as cancelled and transcended individual, i.e. as universal.

The pleasure enjoyed has, indeed, the positive significance that the self has become aware of itself as objective self-consciousness: but the negative import is there as well-that of having cancelled itself. And since it took its realization in the former sense only, its experience comes consciously before it as contradiction, in which the acquired reality of its individual existence finds itself destroyed by the negative element, which stands without reality and without content over against the former, and yet is the force which consumes it. This negative element is nothing else than the notion of what this individuality inherently is. This individuality is, however, as yet the poorest form of self-realizing mind; for it is to itself still simply the abstraction of reason, or is the merely immediate unity of being-for-self and being-in-self (*Für-sich und Ansichseyns*), of explicit and implicit self. Its essential nature therefore is only the abstract category. Still it has no longer the form of immediate simple *being* as in the case of Observation, where it is abstract being, or, when affirmed as something alien, is thinghood in general. Here in the case before us there has entered into this thinghood self-existence (*Fürsichseyn*) and mediation. It comes on the scene here, therefore, in the form of a circular process, whose content is the developed pure relation of the simple essential elements. The actualization attained in the case of this individuality consists, therefore, in nothing else than its having turned out this cycle of abstractions from the restricted confines of simple self-consciousness, and put them into the sphere and condition of “being for consciousness” existence, where they appear spread out in detail as distinct objects.

The sort of object, then, that self-consciousness in its pleasurable enjoyment takes to be its true reality, is the detailed expansion of those bare essential elements of pure unity, of pure difference, and of their relation.

Further than this the object, which individuality experiences as its true nature, has no content. It is what is called *Necessity.* For Necessity, Fate, or the like, is just that about which we are unable to say what it is doing, what its definite laws and its positive content actually are, because it is the absolute pure notion itself, viewed as *being*, relation bare and simple, but imperturbable, irresistible, and immovable, whose work is merely the nothingness of individual existence. It is this firm unbending connexion, because that which is connected consists in pure essentialities or empty abstractions. Unity, Difference, and Relation are categories, each of which is nothing, as it stands by itself, but only in its relation to its opposite, and they therefore cannot come apart from one another. They are by their own notion related to each other, for they are the pure notions themselves; and this absolute relation and abstract process constitute Necessity. The merely particular individuality, which has in the first instance only the pure notion of reason for its content, instead of having escaped from dead theory and plunged into actual life, has thus only precipitated itself into consciousness of its own lifelessness, and enjoys itself merely as naked and alien necessity, *lifeless* actuality.

The transition takes the place from the form of oneness to that of universality, from one absolute abstraction into the other; it proceeds from that purpose of pure explicit existence-for-self, which has cast off fellowship and communion with others, into the sheer opposite — i.e. into equally abstract implicit immanent existence — into mere being-in-itself. This appears consequently in such form that the individual is simply reduced to naught, and the utter atomicity of separate individual existence is pulverized on the equally hard but continuous actuality.

Since it is *qua* consciousness the unity of itself and its opposite, this transition is still a fact *for* it. Its purpose, and its realization as well as the contradiction of what constituted for it its essential nature, and what

inherently that nature is — all this it is consciously aware of. It learns the double meaning which lies in what it did, when it sought to "take" and possess its life: it "took" life, but thereby rather laid hold on death.

This transition of its living being into lifeless necessity appears to it therefore a perversion which is mediated by no agency at all. The mediating factor would have to be that in which both sides would be one, where consciousness thus knew the one moment in the other, found its purpose and action in Fate, and its fate in its purpose and action, saw its own true nature in this Necessity. But, for consciousness the meaning of this unity here is just pleasure itself, or simple particular feeling; and the transition from the moment of this its purpose into the moment of its true nature is for it a mere leap into the opposite. For these moments are not contained and combined in feeling, but only in the bare pure self, which is a universal or thought. Consciousness, therefore, through the experience in which its truth ought to have come to light, has instead become to itself a dark riddle; the consequences of its deeds are to it not really its own deeds. What happens to it is found to be not the experience of what it inherently is; the transition is not a mere alteration in form of the same content and essential nature, presented now as content and true reality of consciousness, thereafter as object or intuitively perceived essence of itself. The abstract necessity thus gets the significance of the merely negative uncomprehended power of universality, on which individuality is broken in pieces.

The appearance of this mode of self-consciousness goes as far as this stage. The last moment of the existence of this mode is the thought of its loss and annihilation in necessity, or the thought of itself as a being (*Wesen*) entirely alien to itself. Self-consciousness in itself, however, has survived this loss; for this necessity or pure universality is its own proper nature (*Wesen*). This reflexion of consciousness into self, the knowledge that necessity is itself, is a new mode or attitude of consciousness.

b

The Law of the Heart, and the Frenzy Of Self-Conceit

Translator's comments: The following section is an analysis of the mood of moral Sentimentalism. It is a mood of all times and appears in many forms; but about Hegel's time it became prominent in the Romantic school and was frankly adopted as a practical attitude by certain of its representatives. Perhaps one of the most remarkable historic examples of sentimentalism was Rousseau, to whom so much in the romantic movement may be traced. In the literature of Hegel's time, and indeed in all literature, no more perfect type of sentimentalism can be found than Goethe's *Werther*. With such instances as these in our minds the succeeding analysis requires neither explanation nor comment.

The Law of the Heart, and the Frenzy Of Self-Conceit

NECESSITY is for this new mode of consciousness what in truth self-consciousness finds necessity in its own case to be. In its new attitude self-consciousness regards itself as the necessary element. It knows that it has the universal, the law, immediately within itself, a law which, because of this characteristic of being immediately within consciousness as it is for itself, is called the Law of the *Heart.* This mode or attitude of consciousness is for itself, *qua* individual, essential reality as the former mode similarly was; but in the present case it is richer by the characteristic that this self-existence is taken as necessary or universal.

The law, therefore, which is primarily the law proper of self-consciousness, or a "heart" which however has in it a law, is the purpose which the self proceeds to realize. It remains to be seen whether its

realization corresponds to its notion, and whether it will therein come to find this its law to be the essential ultimate fact.

Opposed to this "heart" stands a reality. For in the "heart" the law is in the first place merely for itself; it is not yet actualized, and thus, too, is something other than what the notion is. This other is thereby characterized as a reality which is the antithesis of what is to be realized, and consequently is the contradiction of the law and the individual. This reality is thus on the one hand a law by which the particular individuality is crushed and oppressed, a violent ordinance of the world which contradicts the law of the heart, and, on the other hand, a humanity suffering under that ordinance — a humanity which does not follow the law of tile heart, but is subjected to an alien necessity.

'This reality, appearing in opposition to the present mode of consciousness is, as is evident, nothing but the foregoing diremption of individuality and its truth, a relation of gruesome necessity, under which the former is crushed. We, who trace the process, see the preceding movement, therefore, as in opposition to the new form, because the latter has essentially arisen from it, and the moment whence the new form comes is necessary for it. The new mode, however, looks on that moment as something simply met with, since it has no consciousness of its origin, and takes its real essence to consist rather in being independent, in being for itself, or negatively disposed toward this positive, implicit, immanent content.

The aim and object of this individuality is thus to cancel and transcend this necessity which contradicts the law of the heart, as also to do away with the suffering thereby arising. There is in consequence no longer here the frivolity of the former mode, which merely wanted private and particular pleasure; it is the earnestness of a high purpose, which seeks its pleasure in displaying the m excellence of its own true nature, and in bringing about the welfare of mankind. What it realizes is itself the law, and its pleasure is at

the same time universal, a pleasure which all hearts feel. To it both are inseparable; its pleasure is what conforms to the law and the realization of the law of all mankind affords it its particular pleasure. For within its own self individuality and necessity are immediately and directly one; the law is a law of the heart. Individuality is not yet removed from its place; and the unity of both has not been brought about by means of the development of individuality, has not yet been established by discipline. The realization of the immediate undisciplined nature passes for a display of excellence and for bringing about the well-being of mankind.

The law, again, which is opposed to the law of the heart is divided from the heart, and exists on its own account. Mankind, which is bound to it, does not live in the blissful unity of the law with the heart, but either lives in dismal separation and suffering, or at least in deprivation of the enjoyment of itself in obeying the law, and without the consciousness of its own excellence in overstepping it. Because that all-dominating divine and human ordinance is divided from the heart it is regarded by the latter as a delusion, which ought to lose what it still possesses, namely, power and actuality. It may, indeed, in its content agree by chance with the law of the heart, and then the latter can acquiesce in it. But, for the heart, it is not the bare conformity to law as such which constitutes the essential fact (*Wesen*), but the consciousness of itself which the "heart" thereby obtains, the fact that it has therein found self-satisfaction. Where the content of universal necessity, however, does not agree with the heart, necessity is, as regards its content also, nothing in itself, and must give way before the law of the heart.

The individual, then, fulfils, carries out the law of his heart. This law becomes a universal ordinance, and pleasure becomes a reality which, as it stand, conforms to law. But in this realization, the law has, in point of fact, escaped the individual; and thus there arises immediately only that relation

which ought to be cancelled. The law of the heart ceases through its very realization to be a law of the heart. For it thereby takes on the form of actually "being", and is now universal power, which holds this particular "heart" to be a matter of indifference; so that the individual, in establishing his own ordinance, no longer finds it to be his own. By realizing his law be consequently brings about, not *his* law, but — since the realization is inherently and implicitly his own, but explicitly alien and external — merely this: he gets involved and entangled in the actual ordinance, and, indeed, entangled in it, not merely as something alien to himself but as a hostile, overpowering dominion. By his act he takes his place in, or rather as, the general element of existent actuality; and his act is, even in his own regard, intended to have the value of a universal ordinance. But thereby be has let himself get detached from his own self; *qua* universality be lives, grows on his own account, and purifies himself of individuality. The individual who will only recognize universality, in the form of his own immediate self-subsistence (*Fürsichseyn*) does not, therefore, recognize himself in this liberated and independent universality, while all the same he belongs to it, because the latter is his doing. This doing thus has the reverse significance; it contradicts the universal ordinance. For the individual's act is intended to be that of his individual heart, and not independent universal reality; and at the same time he has, in fact, recognized and acknowledged this latter, for the act has the import of setting up his essential nature as free and independent reality, that is to say, of recognizing reality to be his own essential being.

The individual has, by the very principle of his action, determined the more special manner in which actual universality, to which he has leagued himself, gets turned against him. His act, *qua* actuality, belongs to the universal; its content, however, is his own individuality, which wants to preserve itself as this particular individuality in opposition to universality. It

is not any specific law whose establishment is in question; on the contrary, the immediate unity of the individual heart with universality is the idea-raised to the dignity of a law and claiming to be valid — that every heart must recognize its own self in what is universal law. But only the heart of this individual has established its reality in his act, which, in his view, expresses his self-existence (*Fürsichseyn*) or his pleasure. The act is intended to stand immediately for what is universal; that is to say, it is in truth something particular, and has merely the form of universality: his particular content is, as such, to pass for universal. Hence others find in this content not the law of their heart fulfilled, but rather that of some one else; and precisely in accordance with the universal law, that each is to find *his own* heart in what is law, they turn against that reality which he set up, just as he on his side turned against theirs. The individual therefore finds, as at first merely the rigid law, so now the hearts of men themselves opposed to his excellent intentions, and to be detested and detestable.

Because this type of consciousness finds universality in the first place merely as immediate, and knows necessity as necessity of the heart, the nature of actualization and effective activity is to it unknown. This consciousness is unaware that effective realization involves objective existence, and is in its truth the inherently universal in which the particular life of consciousness, which commits itself to it in order to have being in the sense of this immediate individual life, is really submerged. Instead of obtaining this particular life of its own in that objective existence, it thus becomes estranged from itself. But that in which it does not know itself is no longer dead necessity, but necessity animated by universal individuality. It took this divine and human ordinance, which it found authoritative, to be a dead reality, wherein not only its own self — which claims the position of a particular individual, insists on being a particular "heart" with a life of its own and opposed to the universal — but those as well who were subject to

this reality had no consciousness of themselves. Now, however, it finds that reality animated by the consciousness of all, and a law for all hearts. It learns through experience that the reality in question is an ordinance infused and endowed with life, and learns this, indeed, just by the fact that it actualizes the law of its own heart. For this means nothing else than that individuality becomes its own object in the form of universality, without however recognizing itself therein.

Thus, then, what the experience of this mode of self-consciousness reveals as the truth, contradicts what this mode takes itself to be. What, however, it takes itself to be has for it the form of absolute universality; and what is immediately one with consciousness of self is the law of the heart. At the same time the stable living ordinance is likewise its own true nature and work; it produces nothing else but that; the latter is in equally immediate union with self-consciousness. In this way self-consciousness here has the characteristic of belonging to a twofold antithetic essence; it is inherently contradictory and torn to distraction in its inmost being. The law of "this individual heart" is alone that wherein self-consciousness recognizes itself; but the universal and accepted ordinance has by actualizing that law become for self-consciousness likewise its own essential nature and its own reality. What thus contradicts itself within its consciousness has for it in both cases the character of essence, and of being its own reality.

In that it gives expression to this moment of its own conscious destruction, and thereby expresses the result of its experience, it shows itself to be this inner perversion of itself, to be consciousness gone crazy, its own essence being immediately not essence, its reality immediately unreality.

The madness here cannot be taken to mean that in general something unessential is regarded as essential, something unreal as real, so that what

for one is essential or actual might not be so for another, and thus the consciousness of real and of unreal, or of essential and unessential, would fall apart. If something in point of fact is real and essential for consciousness in general, but for me is not so, then, in being conscious of its nothingness, I have, since I am consciousness in general, at the same time the consciousness of its reality; and since they both are fixed and rooted within me, this is a union which is madness in general. In this state, however, there is only an *object* deranged for consciousness — not consciousness as such within itself and for itself. But in the result of the process of experience, which has here come about, consciousness is in its law aware of its self as this individual reality; and at the same time, since precisely this same essential facts this same reality, is estranged from it, it is *qua* self-consciousness, *qua* absolute realty — aware of its unreality. In other words, both aspects are held by it in their contradiction to be directly its essence, which is thus in its utmost being distracted.

The heartthrob for the welfare of mankind passes therefore into the rage of frantic self-conceit, into the fury of consciousness to preserve itself from destruction; and to do so by casting out of its life the perversion which it really is, and by straining to regard and to express that perversion as something else. The universal ordinance and law it, therefore, now speaks of as an utter distortion of the law of its heart and of its happiness, a perversion invented by fanatical priests, by riotous, revelling despots and their minions, who seek to indemnify themselves for their own degradation by degrading and oppressing in their turn — a distortion practised to the nameless misery of deluded mankind.

Consciousness in this its frenzy proclaims individuality to be deranging, mad, and perverted, but this is an alien and accidental individuality. It is the heart, however, or the particular consciousness immediately seeking to be universal, that is thus raving and perverted, and the outcome of its action is

merely that this contradiction comes to its consciousness. For the truth in its view is the law of its heart, something merely intended, which has not stood the test of time as the permanent ordinance has done, but rather is overthrown, as time indeed discloses. This its law ought to have reality: herein the law qua reality, *qua* valid ordinance, is for it purpose and essential nature; but that reality, that very law as valid ordinance, is at once and at the same time for it nothingness and void.

Similarly its own reality, itself as individual consciousness, is in its view the essential truth. Its purpose, however, is to establish that particularity as existent. It thus in the first instance rather takes its self *qua not* — individual to be the truly real; or its self is purpose in the sense of law, and hence precisely a universality, which its self is held to be as object for its consciousness. This its notion comes by its own act to be its object. Its (individual) self is thus discovered to be unreal, and unreality it finds out to be *its* reality. It is thus not an accidental and alien individuality, but just this particular "heart", which is in every respect inherently perverted and perverting.

Since, however, the directly universal individuality is that which is perverted and perverting, this universal ordinance, being the law of all hearts, and so of the perverted consciousness, is no less itself in its very nature the perverted element, as indeed raging frenzy declared. On the one hand this ordinance proves itself to be a law for all hearts, by the resistance which the law of one heart meets with from other individuals. The accepted and established laws are defended against the law of a single individual because they are not empty necessity, unconscious and dead, but are spiritual substance and universality, in which those in whom this spiritual substance is realized live as individuals, and are conscious of their own selves. Hence, even when they complain of this ordinance, as if it went contrary to their own inmost law, and maintain in opposition to it the claims

of the “heart”, in point of fact they inwardly cling to it as being their essential nature; and if they are deprived of this ordinance, or put themselves outside the range of its influence, they lose everything. Since, then, it is precisely in this that the reality and power of public ordinance consist, the latter appears as the essence, self-identical and everywhere alive, and individuality appears as its form.

On the other hand, however, this ordinance is the sphere of perversion. For in that this ordinance is the law of all hearts, in that all individuals are immediately this universal, it is a reality which is only that of self-existing individuality, i.e. of the heart. When consciousness therefore sets up the law of its heart, it finds itself resisted by others because it conflicts with the equally individual laws of their heart; and the latter in opposing it are doing nothing else but setting up in their turn and making valid their own law. The universal here presented, therefore, is only a universal resistance and struggle of all against one another, in which each makes good his own individuality, but at the same time does not come off successfully, because each individuality meets with the same opposition, and each is reciprocally dissipated by the others. What appears as public ordinance is thus this state of war of each against all, in which every one for himself wrests what he can, executes even-handed justice upon the individual lives of others, and establishes his own individual existence, which in its turn vanishes at the hands of others. We have here the *Course of the World,* the mere semblance of a constant regular trend, which is only a pretence of universality, and whose content is rather the meaningless insubstantial sport of setting up individual beings as fixed and stable, and then dissipating them.

If we put both sides of the universal ordinance over against one another and consider them, we see that this later universality has for its content restless individuality, which regards opinion or mere individualism as law, the real as unreal, and the unreal as real. That universality is, however, at

the same time the side of realization of the ordinance, for to it belongs the independent self-existence (*Fürsichseyn*) of individuality. The other side is the universal in the sense of stable passive essence; but, for that very reason, the universal is only something inner, which is not indeed absolutely non-existent, but still not an actual reality and can itself only become actual by cancelling the individuality, that has presumed to claim actuality. This type of consciousness, which becomes aware of itself in the law; which finds itself in what is inherently true and good not as mere individual, but only as essentially real; and which knows individuality to be what is perverted and perverting, and hence feels bound to surrender and sacrifice individualism of consciousness-this type of consciousness is *Virtue*.

c

Virtue and the Course of the World

Translator's comments: The mood of moral sentimentalism is reduced to confusion and contradiction: but the subjective individualism in which it is rooted is not yet eradicated. Individualism now takes refuge in another attitude which claims to do greater justice to the inherent universality of rational self-realization, but yet clings to its particular individuality as an inalienable possession. It now tries to make the realization of universal purposes in the shape of the Good depend solely on its own activity, the objective sphere in which the good is to be carried out being regarded as at once external to its ends, opposing its activity, and yet requiring these ends to be carried out in order to have any moral significance. Individualism looks on the good as its private perquisite, and makes a personal merit and glory out of its action in carrying out the good. This external realm is the "Course of the World" which in itself is thought to contain no goodness, and which only gets a value if the good is realized in it. The world's course

is thus to owe its goodness to the efforts of the individual. A struggle ensues, for the situation is contradictory; and the issue of the struggle goes to prove that the individual is not the *fons etorigo boni*, that goodness does not await *his* efforts, and that in fact the course of the world is at heart good; the soul of the world is righteous.

The attitude analysed here is that of abstract moral idealism, the mood of moral strenuousness, the mood that constantly seeks the improvement and perfectibility of mankind. It is found in many forms, but particularly wherever there is any strong enmity between the “ideal” life and the “life of the world”.

Virtue and the Course of the World

IN the first mode of active reason, self-consciousness felt it was pure individuality; and over against this stood empty universality. In the second the two factors in the antithesis had each both the moments within them, both law and individuality; but the one factor, the “heart”', was their immediate unity, the other their opposition. Here, in the relation of virtue and the course of the world, both members are each severally unity and antithesis of the moments, are each a process, but in an opposite direction, of law and individuality *inter se*. For the virtuous consciousness law is the essential element, and individuality the one to be superseded and cancelled both in the case of its own conscious life, as well as in that of the course of the world. In the former case the private individuality claimed by any one has to be brought under the discipline and control of the universal, the inherently good and true. It remains there, however, still a personal consciousness. True cultivation and discipline consist solely in the surrender of the entire personality, as a way of making sure that in point of fact individual peculiarities are no longer asserted and insisted on. In this

individual surrender, individuality, as it is found in the world's process, is at the same time annihilated; for individuality is also a simple moment common to both.

In the course of the world individuality adopts a position the reverse of what it is in the case of the virtuous consciousness, viz. that of making itself the essential factor, and subordinating to itself the inherently good and true. Further, the course of the world, too, does not mean for virtue merely a universal thus overturned and perverted through individuality; absolute law and order form likewise a common moment: a moment, however, not present in the world's course in the sense of an existing actual fact for consciousness, but as the inmost essence of the process. That regulative order, therefore, has not, properly speaking, to be first produced by virtue, for production means, *qua* action, a consciousness of individuality, and individuality has, on the contrary, to be superseded. By thus cancelling individuality, however, the inherent nature of the world's process merely gets room, as it were, to enter real existence independently on its own account (*an und für sich selbst*).

The general content of the actual course of the world has already made itself known. Looked at more closely, it is again nothing else than the two proceeding movements of self-consciousness. From them have come virtue's shape and mould, for since they originate it, virtue has them before it; its aim, however, is to supersede its source and origin, and realize itself, or be "for itself", become objectively explicit. The way of the world is thus, from one point of view, particular individuality seeking its pleasure and enjoyment, finding itself overthrown in doing so, and as a result satisfying the demands of the universal. But this satisfaction, like the rest of the moments of this relationship, is a perverted state and process of the universal. The real fact is merely the particular pleasure and enjoyment, while the universal is opposed to it — a necessity which is only the empty

shape of universality, a merely negative reaction, the form of an act without any content.

The other moment of the world's course is individuality, which wants to be a law independently and on its own account, and under the influence of this conceit upsets the established regular order. The universal law no doubt manages to hold its own against this sort of conceit, and no longer appears in the form of an empty opposite over against consciousness, does not play the role of a lifeless necessity, but is a necessity operating within the conscious life itself. But in the sense in which it is a reality existing in a *conscious* state of absolute contradiction, it is madness; while in the sense in which it is an objective reality it is simply utter perversion. The universal, then, in both aspects proves to be the might that moves them; but the way this might exists in fact is merely in the form of universal perversion.

It is from virtue that the universal is now to receive its true reality, by cancelling individuality, the principle of perversion. Virtue's purpose is by this means to transmute again the perverted world's process, and bring out its true inner nature. This true being is in the world-process merely in the form of its implicit inherent nature; it is not yet actual; and hence virtue merely *believes* it. Virtue proceeds to raise this faith to sight, without, however, enjoying the fruit of its labour and sacrifice. For so far as it is individuality, it is the active carrying-on of the contest which it wages with the world's process. Its purpose and true nature, however, lie in conquering the reality of the world's process; and the existence of the good thereby effectuated carries with it the cessation of its action, i.e. of the consciousness of individuality.

How this struggle itself will come off, what virtue finds out in the course of it, whether, by the sacrifice which virtue takes upon itself to undergo, the world's process succumbs while virtue triumphs — all this must be decided

from the nature of the living weapons the combatants carry. For the weapons are nothing else than the essential being of the combatants themselves, a being which only makes its appearance for them both reciprocally. What their weapons are is in this way already evident from what is inherently implied in this struggle.

The universal is an authentic element for the virtuous consciousness as a matter of belief; it is "implicitly" or "inherently" true; not yet an actual, but an abstract universality. It plays the rôle of purpose in the case of this consciousness itself, and of inner principle in that of the course of the world. It is also precisely in this character of inner principle that the universal manifests itself in the case of virtue, from the point of view of the world process; for virtue as yet only "wills" to carry out the good, and does not in the first instance claim reality for it. This characteristic can also be looked at in this way: the good, in that it comes on the scene in the struggle with the world process, thereby manifests itself in the form of what is for another, as something which is not self-contained (*an und für sich selbst*), for otherwise it would not want to win its own truth by vanquishing its opposites. By having its being only when it is for another, is meant the same as was shown in the opposite way of looking at it, viz. that it is to begin with an abstraction which only attains reality in a relation, and has no reality of itself as it stands.

The good or universal as it appears here, is, then, what is called *Gifts, Capacities, Powers*. It is a mode or form of spiritual life, where the spiritual life is presented as a universal, which requires the principle of individuality to give it life and movement, and in individuality finds its realization. This universal is *applied well* by the principle of individuality so far as this principle dwells in the consciousness of virtue, and misused by it as far as it is in the world's process — a passive instrument, which is regulated and directed by the hand of free individuality and is quite indifferent to the use

it is put to, and can be misused for the production of a reality which means its ruin: a lifeless material deprived of any independence of its own — a material that can be formed in this way or that, or even to its own destruction.

Since this universal is at the beck and call equally of the virtuous consciousness as well as of the course of the world, it is not apparent whether with this equipment virtue will get the better of vice. The weapons are the same — these capacities and powers. Virtue has, it is true, carefully ensconced its belief in the original unity of its purpose and the essential nature of the world process, and the reserve thus placed in ambush is intended to fall on the rear of the enemy during the fight, and bring that purpose essentially (*an sich*) to fulfilment: so that thereby the knight of virtue finds as a matter of fact that his part in waging this warfare is, properly speaking, a mere sham-fight, which he cannot take seriously because he puts all his strength and confidence in the good being self-sufficient and real *per se,* i.e. in the good bringing about its own fulfilment — a sham-fight which he dare not even allow to become serious. For what he turns against the enemy, and finds turned against himself, and what, both in his own case and as regards his enemy as well, he runs the risk of getting wasted and damaged in the struggle, is not the good itself; he fights to keep and carry that out: what is exposed to the hazard of the contest is merely gifts and capacities that are indifferent to the issue. But these, in point of fact, are nothing else than just that universal from which individuality has been eliminated, and which is to be conserved and actualized by the struggle.

This universal, however, is at the same time directly realized and *ipso facto* made actual by the very notion of the contest; it is the inherent essential nature, the “universal”, and its actualization means merely that it is at the same time for an other. The two aspects mentioned above, in each of

which it became an abstraction, are no longer separated; it is in and through the struggle that the good is simultaneously established in both forms.

The virtuous consciousness, however, enters into conflict with the way of the world as if this were a factor opposed to the good. What the conflict brings to light is the universal, not merely as an abstract universal, but as one animated by individuality, and existing for an other, in other words the universal in the sense of the actually real good. Wherever virtue comes to grips with the world's process, it always hits upon places where goodness is found to exist; the good, as the inherent nature of the world's process, is inseparably interwoven with all the manifestations of it, with all the ways in which the world's process makes its appearance, and where it is real the good has its own existence too. Virtue thus finds the world's process invulnerable. All the moments which virtue was to jeopardize in itself when dealing with the world's process, all the moments which it was to sacrifice — these are just so many ways in which goodness exists, and consequently are inviolable relations. The conflict can, therefore, only be an oscillation between conserving and sacrificing; or rather there can be no place for either sacrificing one's own or doing harm to what comes from elsewhere. Virtue is not merely like the combatant whose sole concern in the fight is to keep his sword polished; but it has even started the fight simply to preserve its weapons. And not merely is it unable to use its own weapons, but it must also preserve intact those of its enemy, and protect them against its own attack, seeing they are all noble parts of the good, on behalf of which it entered the field of battle.

This enemy, on the other hand, has as its essential element not the inherent universal, but individuality. Its force is thus the negative principle before which nothing stands, nothing is absolutely sacred, but which can risk and endure the loss of everything and anything. In so doing it feels victory to be assured, as much from its very nature as by the contradiction

in which its opponent gets entangled. What is to virtue implicit and inherent is taken merely as an explicit objective fact in the case of the world's process. The latter is detached from every moment which virtue finds fixed and to which it is fast secured. The world process has such a moment under its power and has consequently in its control the tethered knight of virtue bound thereto, by the fact that this moment is held to be merely one which the world's process can as readily cancel as let be. This knight of valour cannot work himself loose from it as he might from a cloak thrown round him, and get free by leaving it behind; for it is to him the essential element which he cannot give up.

Finally, as to the ambush out of which the inherent good is cunningly and craftily to fall on the rear of the world process, this hope is vain and foolish from its very nature. The world process is the mind sure of itself and ever on the alert, that can never be got at from behind, but fronts breast-forward every quarter; for it consists in this that everything is an objective element *for* it, everything stands *before* it. But when the inherent goodness is for its enemy, then it finds itself in the struggle we have seen; so far, however, as it is *not* for its enemy, but subsists in itself, it is the passive instrument of gifts and capacities, material without reality. If represented as object, it would be a dormant consciousness, remaining in the background, no one knows where.

Virtue is thus overpowered by the world process, because the abstract unreal essence is in fact virtue's own purpose, and because its action as regards reality rests on distinctions that are solely a matter of words. Virtue wanted to consist in the fact of bringing about the realization of goodness through sacrificing individuality; but the aspect of reality is itself nothing else than the aspect of individuality. The good was meant to be what is implicit and inherent, and opposed to what *is;* but the implicit and inherent, taken in its real truth, is simply *being* itself. The implicitly inherent element

is primarily the abstraction of essence as against actual reality: but the abstraction is just what is not true, but a distinction merely for consciousness; this means, however, it is itself what is called actual, for the actual is what essentially is for an other — or it is being. But the consciousness of virtue rests on this distinction of implicitness and explicit being, a distinction without any true validity.

The world process was supposed to be the perversion of the good, because it took individuality for its principle. But this latter is the principle of actual reality, for it is just that mode of consciousness by which what is implicit and inherent is for an other as well. The world process transmutes and perverts the unchangeable, but does so in fact by transforming it out of the nothingness of abstraction into the being of reality.

The course of the world is, then, victorious over what, in opposition to it, constitutes virtue; it is victorious over that which took an unreal abstraction to be the essential reality. But it is not victorious over something real, but over the production of distinctions that are no distinctions, over this pompous talk about the best for mankind and the oppression of humanity, about sacrifice for goodness' sake and the misuse of gifts. Imaginary idealities and purposes of that sort fall on the ear as idle phrases, which exalt the heart and leave the reason a blank, which edify but build up nothing that endures: declamations whose only definite announcement is that the individual who professes to act for such noble ends and indulges in such fine phrases holds himself for a fine creature: a swollen enlargement which gives itself and others a mighty size of a head, but big from inflation with emptiness.

Virtue in the olden time had its secure and determinate significance, for it found the fullness of its content and its solid basis in the substantial life of the nation, and had for its purpose and end a concrete good that existed and lay at its hand: it was also for that reason not directed against actual reality

as a general perversity, and not turned against a world process. The virtue above considered, however, is removed from that substantial life, and is outside it, a virtue with no essential being, a virtue merely in idea and in words, and one that is deprived of all that content.

The vacuousness of this rhetorical eloquence in conflict with the world's process would be at once discovered if it were to be stated what all its eloquent phrases amount to. They are therefore assumed to be familiar and well-understood. The request to say what, then, this "well-known" is would be either met by a new swell of phrases, or in reply there would be an appeal to the "heart" which "inwardly" tells what they mean — which is tantamount to an admission of inability to say what the meaning is.

The fatuousness of that style of eloquence seems, too, in a quasi-unconscious manner to have got the length of being an acknowledged certainty for the cultivated minds of our time, since all interest in the whole mass of those rhetorical spread-eagle phrases has disappeared — a loss of interest which is betrayed in the sheer wearisomeness they produce.

The result, then, arising from this opposition, consists in the fact that consciousness lets the idea of an inherent good, which yet has no actual reality, slip from it like a mere cloak. Consciousness has learned in the course of its struggle that the world's process is not so bad as it looked; for the reality of the world's process is that of the universal. With the discovery of this it is seen that there is no way of producing the good through the sacrifice of individuality, the means for doing so have gone; for individuality is precisely the explicit actualization of what is implicitly and inherently real (i.e. the universal); and the perversion ceases to be looked at as a perversion of goodness, for it is just the transmuting of the good, *qua* bare purpose, into actual reality. The movement of individuality is the reality of the universal.

In point of fact, however, what as world process stood opposed to the consciousness of the inherently and implicitly real, has likewise been vanquished and has disappeared with the attainment of the above result. The self-existence of individuality was there in opposition to the inner essential nature, the universal, and made its appearance as a reality cut off from the inherent implicit nature. Since, however, it has come out that reality is in undivided unity with the universal, the self-existence of the world's process proves not to be more than an aspect, just as the inherent nature (*Ansich*) of virtue is merely an aspect too (*Ansicht*). The individuality of the world's process may doubtless think it acts merely for itself or selfishly; it is better than it thinks; its action is at the same time one that is universal and with an inherent being of its own. If it acts selfishly, it does not know what it is doing; and if it insists that all men act selfishly, it merely asserts that all men are unaware as to what action is. If it acts for itself, this is just the explicit bringing into reality of what is at first implicit and inherent. The purpose of its self-existence, of its "being for itself", which it fancies opposed to the inherent nature — its futile ingenuity and cunning, as also its fine-spun explanations which so knowingly demonstrate the existence of selfishness everywhere — all these have as much vanished as the purpose of the inherent element and its rhetoric.

Thus, then, the effort, the struggle, the activity of individuality is inherently an end in itself; the use of powers, the play of their outward manifestations — that is what gives them life: otherwise they would be lifeless, potential, and merely implicit (*Ansich*). The inherent implicit nature is not an abstract universal without existence and never carried into effect; it is itself immediately this actual present and this living actuality of the process of individuality.

C

Individuality, which Takes Itself to Be Real In and for Itself

Translator's comments: The following section gives a general description of individuality which seeks to realize itself, not in the one-sided ways analysed in the three preceding sections, but as a complete concrete whole. Here individuality does not regard itself abstractedly, and hence does not treat the sphere of its realization as in any way alien to itself. It is completely one with the objective world where it carries out its ends, and finds both itself adequate to its own realization, and the world sufficient and all-sufficient for the embodiment of its ends. In this sphere we have, as it were, the very antithesis of the preceding state of mind. There the good was opposed to the course of the "world", the latter being dependent for its goodness on individual effort. Here it is as if the "world" were made up of the activity of individuals and were wholly adequate to satisfy and embody all their ends. The real life of the individual is found simply in "self-expression". Naturally therefore individuals take themselves here to be "real just as they are", and have merely to express or develop their own content in order to objectify their ends. The objective world *is* their activity realized, is themselves "externalized".

This condition of individuality is the immediate preparation for the social order of the life of a free spiritual community, and is the anticipation of that community-a community where the individual is universalized through union with the whole, and the whole particularized in the individual.

Individuality, which Takes Itself to Be Real In and for Itself

SELF-CONSCIOUSNESS has now grasped its own principle, which at first was only *our* notion of it, viz. the notion that, when consciously certain

of itself, it is all reality. Its purpose and nature henceforward consist in the interpenetration of the universal (its "gifts" and capacities") and individuality. The individual moments of this process of complete concrete permeation preceding the unity into which they have now coalesced, were found in the purposes hitherto considered. These have now vanished — as being mere abstractions and chimeras, which belong to those first shallow modes of mind's self-consciousness, and which have their truth merely in the illusory "being" of the "heart", fancy and rhetoric, and not in reason. This reason is now sure of its own reality as it stands (*an und für sich*), and no longer views itself as an ideal purpose which it seeks to realize from the outset in opposition to immediately existent (sensible) reality, but, on the contrary, has the category as such as the object of its consciousness.

This means that the character of being for itself on its own account (*für sich*), or of negative self-consciousness, with which reason started, is cancelled. This self-consciousness at that stage fell in with a reality which was supposed to be its own negative, and by cancelling which it was to realize its purpose. Now that purpose and inherent nature (*Ansichseyn*) have proved to be the same as objective existence for another and the given reality, [objective] truth is no longer divided from [subjective] certainty — no matter whether the proposed purpose is taken as certainty of self and the realization of that purpose as the truth, or whether the purpose is taken for the truth and reality for certainty. The essential nature and purpose as it stands (*an und für sich*) constitute the certainty of immediate reality itself, the interpenetration of the inherent implicit nature (*ansich*), and the explicit distinctive nature (*fürsich*), of the universal and individuality. Action is *per se* its truth and reality, and the manifestation or expression of individuality is its purpose taken just as it stands.

With the attainment of such a conception, therefore, self-consciousness has returned into itself and passed from those opposite characteristics which

the category presented, and which its relation to the category had, when it was "observing" and when it was "active". Its object is now the category pure and simple; in other words, it is itself the category become conscious of itself. Its account with its previous forms is now closed; they lie behind it in the forgotten past; they do not come forward against it as its world found ready to hand, but are developed solely within itself as transparent moments. Yet they still fall apart within its consciousness at this stage as a movement of distinct moments, which has not yet got combined into its own substantial unity. But throughout all these moments self-consciousness holds firmly to that simple unity of self with objective existence which is its constitutive generic nature.

Consciousness has in this way cast away all opposition and every condition limiting its activity. It starts anew from itself, and is occupied not with something external, but with itself. Since individuality is in itself actuality, the material of operation and the purpose of action lie in the action itself. Action consequently has the appearance of the movement of a circle, which moves itself within itself freely *in vacuo*, which, unimpeded, now enlarges and then contracts, and is quite content to play simply within itself and with itself. The element in which individuality manifests and displays its form and shape, is simply the day, in whose light consciousness wants to display itself. This element-the daylight-means nothing but the simple assuming of the form of individuality. Action alters nothing, opposes nothing; it is the mere form of translation from a condition of being invisible to one of being visible, and the content, brought thus to daylight, and laid bare, is nothing else than what this action already is implicitly (*an sich*). It is *implicit* — that is its *form* as unity in *thought*: and it is *actual* — that is its form as unity in *existence*: while it is itself *content* merely in virtue of maintaining this character of simplicity in spite of its aspect of process and transition.

Introductory Note

Self-Contained Individuals Associated as a Community Of Animals, and the Deception Thence Arising: The Real Fact

Translator's comments: The title of this section sounds unfamiliar; but the purpose of the analysis is plain, and the argument is essential as a stage in the unfolding of what rational self-contained individuality implies. It also, with the immediately succeeding sections, prepares the way for the constructive interpretation of organized society. Indeed, without individuals constituted as rational self-conscious units, each self-contained, a free self-conscious community could not exist. They form the component separate cells of the "organism" of a society, the elements out of which the compact structure of a society is made. In the first instance and as an abstract aspect of associated life, they can be regarded, and for certain purposes are in fact regarded, as merely distinct and detached units living together. Each functions as an individuality, endowed with certain powers and capacities for self-expression, pursuing his ends for his own interest, spontaneously putting forth his energies without being clearly aware of or concerned with any universal result which his essentially universal nature must bring about. In realizing his individuality he goes out of himself in one sense, in another sense he does not. By expressing himself he carries out some "end" in which he has an "interest"; he "does" something: he does a deed or a "work", which *qua* mere action is nothing more than a mode of purposed self-expression, and is not, as such, either good or bad (at this stage). What he does appears as external to himself, but is his own all the while, something which he has formed and in which he specifically is interested. Such a result at once objective, framed by himself and reflecting his

interest, is “fact” as distinct from “thing” (which is an object of perception at the level of consciousness, not of self-consciousness). But by the nature of the case he can distinguish within this fact what is the real “intent” (*die Sache Selbst*) he has in mind from the merely objective character of the fact (*Sache*); he can, if we may put it so, distinguish the “fact of the matter” from mere “matter of fact”. But other individuals with whom he is associated and who are similarly constituted, carry on the same process of separate self-expression. Each is “honest” and “honourable” in so doing: each is concerned with his own “real intent” and his own “fact”. By this association they necessarily are interrelated and intercommunicate. But communication on such a basis leads to misconception, transference of intent, and “deception” of each other as well as of themselves. Work, deeds, facts have a universal character as well as a particular nature: in the former aspect they cannot be one’s own, in the latter aspect they cannot be another’s: yet both aspects are inseparable. Intercommunication between these individuals thus inevitably leads to contradiction. It implies a common universal nature between the individuals: but such universality at this stage is implicit not explicit. The contradiction inherent at this level between the elements in the situation created by individuals merely coexisting together without a conscious common purpose controlling and guiding all, points the way and compels an advance to another stage in the evolution of rational individuality.

When self-conscious individuals are regarded as merely “together”, as coexisting without consciously controlling common purposes, they resemble a community or herd of animals. Hence the title of the Section.

It is not an accidental but an essential aspect of the life of society; it is indeed the indispensable basis of community which is in one respect like a community of ants, the system of activity of its component individuals, though each may and does fulfil his purpose as his own private interest.

This aspect of social existence can be over-emphasized and may be regarded at times as the sole nature of society. The result can only lead to confusion. Such a conception of society may perhaps be said to be found where, as in certain economic conceptions of society, society is viewed as a herd of self-interested units each pursuing his own individual ends. It is also seen in certain historical forms of national polity which recur from time to time.

Self-Conscious Individuals Associated as a Community of Animals and the Deception Thence Arising: The Real Fact

THE above substantial individuality, to begin with, is again single and determinate. Absolute reality, which it knows itself to be, is thus, in the way it becomes consciously aware of that reality, abstractly universal, without filling and content, merely the empty thought of this category. We have to see how this conception of substantial individuality is made explicit in its various moments, and how it comes to be conscious of its true nature.

The conception of this individuality, as it takes itself as such to be all reality, is in the first instance a mere *result*: its own movement and reality are not yet set forth; it is here in its immediacy as something purely and simply implicit. Negativity, however, which is the same as what appears as movement and process, is inherent in this implicit state as a determinate quality; and being, i.e. the simple implicit state, comes to be a determinate compass or range of being. Individuality confronts us, therefore, as an original determinate nature: *original*, in virtue of its being implicit: originally *determinate*, in virtue of the negative moment lying in that implicitness, which negative element is thereby a quality. This limitation cannot, however, limit the action of consciousness, for this consists at the present stage in thorough and complete relation of itself to itself: relation to

what is other than itself, which its limitation would involve, is now overcome. The character inherent originally by nature is thus merely an undefined (simple) principle, a transparent universal element in which individuality finds itself free and at one with itself, as well as unfolds its diversity without restraint, and in realizing itself is simply in reciprocal relation with itself. We have here something similar to what we find in the case of indeterminate animal life: this breathes the breath of life, let us say, into water as its element, or air or earth, and within these again into still more determinate conditions: every aspect of its life is affected by the specific element, and yet animal life still keeps these aspects within its power and itself a unity in spite of the limitations of the element, and remains *qua* the given particular organization animal life throughout, the same general fact of animal life.

This determinate original nature of consciousness, in which it finds itself freely and wholly, appears as the immediate and only proper content of the purpose of the individual. That content is indeed a definite content, but is only content so far as we take the implicit nature in isolation. In truth, however, it is reality (*Realität*) permeated by individuality: actuality (*Wirklichkeit*) in the way consciousness *qua* individual contains this within itself, and is to begin with taken as existing, but not yet as acting. So far as action is concerned, however, that determinateness is, in one respect, not a limitation it wants to overcome; for, looked at as an existent quality, that determinateness is simply the colour of the element where it moves: in another respect, however, the negativity is determinateness merely in the case of what "exists". But acting is nothing else than negativity. Hence when individuality acts, its specific determinateness is dissipated into the general process of negation, into the sum and substance of all determinateness.

The simple “original nature” now breaks up, in action and the consciousness of action, into the distinction which action implies. To begin with, action is here an object, an object, too, still belonging to consciousness; it is present as a purpose, and thus opposed to a given reality. The other moment is the process of this statically presented purpose, the process of actualization of the purpose, bringing the purpose to bear on the entirely formal reality, and hence is the idea of the transition itself. In other words, this second moment is the “means”. The third moment is, finally, the object, no longer as immediately and subjectively presented purpose, but as brought to light and established as something other than and external to the acting subject.

These various aspects must be viewed in the light of the general principle of this sphere of consciousness. The content throughout remains the same, without any difference, whether between individuality and existence in general, or between purpose as against individuality in the sense of an “original nature”, or between purpose and the given reality: or between the means and that reality as absolute purpose: or finally between the reality moulded by the agent as against the purpose, the “original nature”, of the means.

At the outset, then, the nature of individuality in its original determinate form, its immediate essence, is not yet affirmed as active; and in this shape is called special capacity, talent, character, and so on. This peculiar colouring of mind must be looked at as the only content of its purpose, and as the sole and only reality. If we thought of consciousness as going beyond that, as seeking to bring into reality another content, then we should think of it as a nothing working away towards nothing.

This original nature is, moreover, not merely the substance of its purpose, but implicitly the reality as well, which otherwise assumes the appearance of being a given material on which to act, of being found ready

at hand for action to work up into some determinate form. That is to say, acting is simply transferring from a state not yet explicitly expressed to one fully expressed; the inherent being of that reality opposed to consciousness has sunk to the level of a mere empty appearance, a mere seeming. This mode of consciousness, by determining itself to act, thereby refuses to be led astray by the semblance of reality on the part of what is presented to it; and has likewise to abandon its dealings with idle thoughts and purposes, and keep its hold on the original content of its own nature. No doubt this content first exists as a fact for consciousness, when it has made that content actual; but the distinction between something which while *for* consciousness is only inside itself, and a reality outside consciousness existing in itself, has broken down. Consciousness must act solely that what it inherently and implicitly is, may be for it explicitly; or, acting is just the process of mind coming to be *qua* consciousness. What it is implicitly, therefore, it knows from its actual reality. Hence it is that an individual cannot know what he is till he has made himself real by action.

Consciousness, however, seems on this view to be unable to determine the purpose of its action before action has taken place; but before action occurs it must, in virtue of being consciousness, have the act in front of itself as entirely its own, i.e. as a purpose. The individual, therefore, who is going to act seems to find himself in a circle, where each moment already presupposes the others, and hence seems unable to find a beginning, because it only gets to know its own original nature, the nature which is to be its purpose by first acting, while in order to act it must have that purpose beforehand. But just for that reason it has to start straight away and, whatever the circumstances are, without troubling further about beginning, means, or end, proceed to action at once. For its essential and implicit (*ansichseyende*) nature is beginning, means, and end all in one. As *beginning*, it is found in the circumstances of the action; and the *interest*

which the individual finds in. something is just the answer to the question, “whether he should act and what is to be done in a given case”. For what seems to be a reality confronting him is implicitly his own original fundamental nature, which has merely the appearance of an objective being — an appearance which lies in the notion of action involving as this does self-diremption, but which expressly shows itself to be his own original nature by the interest the individual finds therein. Similarly the *how,* the means, is determined as it stands (*an und für sich*). Talent is likewise nothing but individuality with a definite original constitution looked at as the subjective internal means, or transition of purpose into actuality. The actual means, however and the real transition are the unity of talent with the nature of the fact as present in the interest felt. The former [talent] expresses that aspect of the means which concerns action, the latter [the fact found of interest] that which concerns content: both are individuality itself, as a fused whole of acting and existing. What we find, then, is *first* circumstances given ready to hand, which are implicitly the original nature of the individual; *next* the interest which affirms them as its own or as its purpose; and *finally* the connexion and sublation of these opposite elements in the means. This connexion itself still falls within consciousness, and the whole just considered is one side of an opposition. This appearance of opposition which still remains is removed by the transition, i.e. by the means. For the means is a unity of inner and outer, the antithesis of the determinate character it has *qua* inner means (viz. talent): it therefore abolishes this character, and makes itself — this unity of action and existence — equally an outer, viz.: the actually realized individuality, i.e. individuality which is established for individuality itself as the objectively existent. The entire act in this way does not go beyond itself, either as circumstances, or as purpose, or means, or as work performed.

In this notion of work, however, the distinction which lay within the original nature seems to enter. The work done is something determinate, like the original nature it expresses, because being cut loose by the process of acting and become an existing reality, the negation implied in this process remains in it as a quality. Consciousness, however, as against the work, is specifically that in which this quality is to be found as a general process of negation, as acting. It is thus the universal as opposed to the specific determinateness of the work performed; it can therefore compare one kind of work with another, and can thence apprehend individualities themselves as different; it can, e.g. regard an individual who is of wider compass in his work as possessing stronger energy of will or a richer nature, i.e. a nature whose original constitution (*Bestimmtheit*) is less limited; another again as a weaker and a poorer nature.

In contrast with this purely quantitative difference, which is not an essential difference, “good” and “bad” would express an absolute difference; but this is not in place here. Whether taken in one way or another, action is equally carried on; there is a process of displaying and expressing an individuality, and for that reason it is all good: it would, properly speaking, be impossible to say what “bad” is to be here. What would be called a bad work is the individual life of a certain specific nature, which is therein realized. It would only be degraded into a bad work by a reflective comparison, which, however, is quite empty and futile, since this goes beyond the essential meaning and nature of work (which is a self-expression of individuality, and then seeks to find and demand from it heaven knows what else.

The comparison could have to do only with the distinction above mentioned. But this, being a distinction of quantity, is *in itself* not an essential one; and here in particular is unessential because what are to be compared together are different works and individualities. But these do not

affect one another; each is concerned simply with itself. The original nature is alone the essential fact, or what could be used as an ultimate standard of judgment regarding the work; and conversely. Both, however, correspond to each other: there is nothing *for*, individuality which is not obtained *throug*h it: or there is no *reality* which is not *its* nature and *its* action, and no action nor inherent substance of individuality which is not real. And only these moments are to be compared.

There is, therefore, in general, no ground for feeling elevated or for lamenting or repenting: all that sort of thing arises from a reflection which imagines another content and another inner nature than is to be found in the original nature of the individual and the actual carrying of it out in reality. Whatever it is that the individual does, and whatever happens to him, that the individual has done, and is that himself. He can only have the consciousness of the mere transference of his self from the darkness of possibility to the daylight of the present, from a state abstract and implicit to the significance of actual being, and can have only the certainty that what seems to him in the second state is nothing else than what lay dormant in the former. The consciousness of this unity is no doubt likewise a comparison, but what is compared is just a mere appearance of opposition, a formal appearance which for reason, *qua* self-conscious and aware that individuality is inherently actuality, is nothing more than seeming. The individual, therefore, knowing that he can find in his objective actuality nothing but its unity with himself or can find only the certainty of himself in its very truth, and knowing that he thus always attains his purpose — can experience only a sense of joy in himself.

That, then, is the conception consciousness has of itself when it is sure of its being an absolute identification, a complete permeation, of individuality and existence. Let us see whether this notion is confirmed and supported by its experience, and whether its reality agrees with this notion.

The work produced is the reality which consciousness gives itself. It is there that the individual becomes consciously what he is implicitly, and in such wise that the consciousness which becomes aware of the individual in the work performed is not the particular consciousness but universal consciousness. He has placed himself by his work quite outside in the element of universality, in the characterless, qualityless region of existence. The consciousness which withdraws from its work is in point of fact universal-because it becomes, in this opposition between work and consciousness, absolute negativity, the process of action-and stands over against its work, which is determinate and particular. It thus goes beyond itself *qua* work, and is itself the indeterminate region which its work still leaves void and unfilled. If their unity was in the above notion still preserved, this took place just through the work being cancelled *qua* objectively existing product. But it has to *be*, and we have to see how individuality will retain its universality in the existence of the work, and will know how to get satisfaction.

To begin with we have to consider by itself the work which has come into being. It has received within it the entire nature of the individual. Its existence is therefore itself an action, in which all distinctions interpenetrate and are resolved. The work is thus thrown out into a subsisting form where the specific character of the original nature does in fact come out as against other determinate natures, encroaches on them, just as these in their turn encroach on it, and is lost as a vanishing moment in this general process. Although in the conception of individuality as here dealt with, the various moments (circumstances, purpose, means, and realization) are all alike, and the original specific nature stands for no more than a universal element, on the other hand, when this element takes on an objective existence, its determinate character as such comes to light in the work done, and obtains its truth in its dissolution. Looked at more closely, this dissolution is such

that in this specific character the individual, *qua* this individual, has become consciously real; but the specific character is not merely the content of reality, but its form as well; or this reality as such is as a whole just this specific character, viz. being opposed to self-consciousness. On this view this reality is seen to be a reality which has disappeared out of the notion, and is merely found given as an alien reality. The work *is*, i.e. it is for other individuals, and for them it is an external, an alien reality, in whose place they have to put their own, in order to get by *their* action consciousness of *their* unity with reality. In other words, the interest which they take in that work owing to their original constitution is other than the peculiar interest of this work, which thereby is turned into something different. The work is, thus, in general something transitory, which is extinguished by the counter-action of other powers and interests, and displays the reality of individuality in a transitory form rather than as fulfilled and accomplished.

Consciousness, then, by doing work becomes aware of that contrast between being and acting, which in the earlier forms of consciousness was at, the same time the beginning of action, and is here merely a result. This contrast, however, was in fact likewise the ultimate principle involved when consciousness proceeded to act as an implicitly real individuality; for action presupposed the determinate original nature as the ultimate implicit element, and the mere process of performing the act for the sake of this performance took that nature as its content. Mere action is, however, the self-identical form, with which, consequently, the specific determinateness of the original nature does not agree. It is a matter of indifference here, as elsewhere, which of the two is called notion and which reality. The original nature is the thought element, the implicit factor as against the action, in which it first gets its reality; or, again, the original nature is the existence both of individuality as such and of individuality in the form of work; while action is the original notion as pure and simple transition, as the process of

becoming. This lack of correspondence between idea and reality, which lies in its essence, consciousness learns in its work; in work, therefore, consciousness becomes aware of itself as it in truth is, and its empty notion of itself disappears.

In this fundamental contradiction characteristic of work — which contains the truth of this individuality that takes itself to be inherently real — all the aspects of individuality thus appear again as contradictory. That is to say, in the work (done) the content of the entire individuality is put forth out of the process of doing (it), which is the negative unity holding fast all the moments of that content, into (objective) existence. So transferred and set forth, the work (done) lets the moments now go free; and in the element of factual subsistence they become indifferent to one another. The notion and its reality are thus separated into purpose and the original essential nature (*Wesenheit*). It is an accident that the purpose should have a true being, or that the implicit inherent nature should be made a purpose. Similarly, again, notion and reality fall apart as transition to actuality and as purpose; in other words, it is an accident that the means expressing the purpose should actually be chosen. While, finally, these inner moments taken together (whether they have some intrinsic unity or not) — i.e. the action of the individual — are again accidentally related to actuality in general: fortune decides equally in favour of a badly determined purpose and badly selected means, as well as against them.

If, now, consciousness hereby becomes aware in its work of the opposition between willing and performance, between purpose and means, and again between this inward nature, taken all together, and actual reality — an opposition which as a whole shows the fortuitous character of the action of consciousness-still the unity and the necessity of this action are just as much present too. This latter aspect transcends the former, and experience of the fortuitousness of the action is itself only a fortuitous

experience. The necessity of the action consists in this, that purpose is directly related to actuality, and the unity of these is the very notion of action: the act takes place because action is *per se* and of itself the essence of actuality. In the work there is no doubt comes out the fortuitousness which characterizes accomplishment when contrasted with willing and the process of performing; and this experience, which seems as if it must be the truth, contradicts that notion of the act. Still, if we look at the content of this experience taken in its completeness, that content is seen to be the transitory work. What persists is not the transitoriness; rather this is itself actual and is bound up with the work, and vanishes with it; the negative falls away along with the positive whose negation it is.

The very notion of substantially and inherently real individuality contains within it this transience of transitoriness (*Verschwinden des Verschwindens*). For that wherein the work disappears, or what disappears in the work, is the objective reality; and this same reality was to give experience, as it was called, its supremacy over the notion which individuality has about itself. Objective reality, however, is a moment which itself has no longer independent truth in this mode of consciousness; it (i.e. the truth) consists solely in the unity of this consciousness with action, and the true work is only that unity of action and existence, of willing and performance. Because of the certainty fundamental to its actions, consciousness takes the actual reality opposed to that conscious certainty to be something which itself is only *for* consciousness. The opposition cannot any longer occur for consciousness in this form of its self-existence in contrast to reality, when consciousness is self-consciousness returned into itself and with all opposition gone. On the contrary, the opposition and the negativity manifested in the case of work then affect not only the content of the work or the content of consciousness as well, but the reality as such, and hence affect the opposition present merely in virtue of that reality and in it,

and the disappearance of the work. In this way consciousness turns from its transitory work back upon itself, and asserts its own notion and its certainty to be what is permanent and abiding, as opposed to the experience of the fortuitousness of action. In point of fact it comes to know its essential principle or notion, in which the reality is only a moment, something *for* consciousness, not something in and for itself; it finds that reality to be a passing moment, of significance therefore merely as being in general, whose universality is one and the same with action. This unity, this identity is the true work; it is the real intent, *the fact of the matter* (*die Sache selbst*), which asserts itself at all costs and is felt to be the lasting element, independent of "fact" which is the accident of an individual action as such, the accident of circumstances, means, and actuality.

The main concern (*die Sache selbst*) stands opposed to these moments only so far as they claim to have a value in isolation, but is essentially their unity, because identifying, fusing, actuality with individuality. It is, too, an action, and, *qua* action, pure action in general, and thereby just as much action of *this* individual; and this action, because still appertaining to the individual in opposition to actuality, has the sense of a purpose. Similarly it is the transition from this specific character to the opposite: and finally it is a reality which is present objectively for consciousness. The main intent thus expresses the essential spiritual substance in which all these moments as independently valid are cancelled and transcended and so hold good only as universal; and in which the certainty consciousness has regarding itself is a "fact" — a real object before consciousness, an object born of self-consciousness as its own, without ceasing to be a free independent object in the proper sense. The "thing", found at the stage of sense-certainty and perception, now gets its significance through self-consciousness, and through it alone. On this rests the distinction between a thing (*Ding*) and a

fact (*Sache*). A process is gone through here corresponding to what we find in the case of sense-experience and perception.

Self-consciousness, then, has attained its true conception of itself when this stage of the real intent is reached; it is the interpenetration of individuality and objectivity: an interpenetration which has become objective. In it self-consciousness has arrived at a consciousness of its own substance. At the same time, as we find self-consciousness here, it is a consciousness of its substance which has just arisen, and hence is immediate; and this is the specific way in which we find spirit at the present stage: it has not yet reached its truly real substance. The objectified intent takes in this immediate consciousness the form of bare and simple essence (*einfachen Wesen*), which being universal, contains all its various moments in itself and belongs to them, but, again, is also indifferent towards them taken as specific moments, and is independent by itself; and, as this free and objective simple abstract "fact", passes for the essentially real (*Wesen*). The various moments of the original determinateness, the moments of the "fact" of *this* particular individual, his purpose, means, action, and actual reality, are, on the one hand, particular moments for this consciousness, which it can abandon and give up for the objectified intent; on the other hand, however, they all have this object as their essential nature, but only in such a way that it, being their abstract universal, can find itself in each of these different moments and be their predicate. The objectified intent is not yet subject; but those moments stand for subject, because they belong to the aspect of individualness, while the object in mind is only at this stage bare universality. It is the genus which finds itself in all these moments as species of itself, and is equally independent of them.

Consciousness is called "honest", when it has on the one hand attained this idealization (*Idealismus*), which objectified intent expresses, and on the other possesses the truth in it *qua* this formal universality. Consciousness

when so characterized is solely concerned with intended object, and hence occupies itself with its various moments or species. And when it does not reach this fact in one of these moments, does not find the real intent in one meaning, it just on that account lays hold of the fact in another; and consequently always really secures that satisfaction which should belong to this mode of consciousness by its very nature (*seinem Begriffe nach*). However things turn out, it achieves and secures the objectified intent, for the latter, being this universal *genus* of those moments, is the predicate of all.

Should it not bring a purpose into reality, it has at least *willed* the purpose, i.e. turns purpose *qua* purpose, mere doing which does nothing, into the real intent, and can therefore maintain and feel consoled that at least there has always been something attempted, something done. Since the universal contains within it even the negative or the transitoriness, this too, the self-annihilation of the work, is itself *its* doing. It has stimulated others towards this, and still finds satisfaction in the disappearance of its reality, just as bad boys enjoy a personal pleasure in getting their ears boxed because they are the cause of its being done. Or, again, suppose it has not so much as tried to carry out the real intent and done nothing at all, then it has not *cared*; the objectified intent is for it just the unity of its decision with reality; it asserts that the reality would be nothing else than its own wish in the matter (*sein Mögen*). Finally, suppose something of interest has come its way entirely without its help, then for it this reality is the real intent just by the interest which it finds therein, although that reality has not been produced by its doing. If it is a piece of good luck, which has befallen the individual personally, he reckons it his own act and his own desert; if it is, on the other hand, a mere event in the world, which does not concern him further, he makes it likewise his own, and an interest, where he has done

nothing, is held as a party interest which *he* has taken up and defended or maintained, for or against.

The “Honesty”, or “Honourableness”, of this mode of consciousness, as well as the satisfaction which it meets with at every point, really consists, as the above makes clear, in this, that it does not bring together its ideas regarding the objectified intent. Its own affair (*seine Sache*), no work at all, or mere action and bare purpose, or again a reality involving no action at all — all and every one of these are equally the real intent: it makes one meaning after another the subject of this predicate, and forgets one after the other. By its having merely willed or, again, in not having cared, the real intent has now the meaning of empty purpose, and of the merely ideal thought-unity of willing and performance. The consolation for the annihilation of the purpose which was at all events willed or at all events simply done, as well as the satisfaction of having given others something to do, makes simple doing, or entirely bad work, the essential reality; for that must be called a bad work which is no work at all. Finally, in the case of finding through good luck the reality at hand, this existence without any act becomes the real intent.

The true meaning of this “Honesty”, however, lies in not being so honest as it seems. For it cannot be so unintelligent as to let these various moments fall apart in that way; it must have an immediate consciousness regarding their opposition, because they are absolutely related to one another. Bare action is essentially action of *this* individual, and this action is likewise essentially an actuality or a “fact”. Conversely, actuality essentially is only as his own action, and as action in general as well; and just as his own action is action in general, so it is only reality in general. While, then, he thinks he has only to do with the objectified intent as abstract reality, there is also present this idea that he has to do with it as his own doing. But precisely so far as it is only a matter of being busy about doing something,

he is not really in earnest in the matter, but rather is dealing with a "fact", and with fact as his own. Since, finally, he seems to will merely *his own* "fact" and his own action, it is again a matter of dealing with "fact" in general or actuality substantial and abiding (*an und für sich bleibende*).

Just as the real intent and its moments appear at this stage as *content*, they are likewise necessary also as *forms* in consciousness. They come forward as content merely to pass away again, each making room for the other. They have therefore to be present in the character of cancelled and sublated forms: so taken, however, they are aspects of *consciousness* itself. The real intent is present as the inherent nature or reflexion of consciousness into self; the ousting of the moments by each other there finds expression, however, in their being established in consciousness, not *per se*, but only for another consciousness. One of the moments of the content is exposed by it to the light, and presented as an object for others. Consciousness, however, is at the same time reflected therefrom back upon itself, and the opposite is thus equally present within it, is retained for itself as its own. There is, too, not one of them which could be *merely* and solely put outside, and another *merely* retained within; rather, consciousness operates alternately with them, for it has to make one as well as another essential for itself and for others. The *whole* is the moving process of permeating individuality with the universal. In that this consciousness finds this whole, however, to be merely the simple ultimate nature (*Wesen*) and thus the abstraction of the real intent, the moments of this whole appear as distinct outside that object and outside one another. As a single whole it is only exhaustively exhibited by the process of alternately exposing its elements to view and keeping them within itself. Since in this alternation consciousness has in its process of reflexion one moment for itself and keeps it as essential, while another is merely externally implied or is for *others,* there thus enters a play of individualities with one another, where

they both deceive and find deceived themselves and one another reciprocally.

An individuality, then, sets to work to carry out something; by so doing it seems to have made something into an "actual fact". It acts; by so doing it comes out before others, and seems to be concerned to secure the reality of something. Others, therefore, take its action to be an interest in the "fact" as such, and take the end of the act to be the carrying out of the "fact" *per se,* regardless of whether this is done by the former individuality or by them. When on this account they point out that this "fact" has been already brought about by themselves, or, if not, offer and actually furnish their assistance, then they see that consciousness has rather left the position where they think it to be; it is its own action and effort, which arouses its interest in the "fact", and when they come to know that this was the real intent, the fact of the matter, they feel themselves deceived. In reality, however, their haste to render assistance was itself nothing else than their desire to see and manifest their own action and not the objectified intent, i.e. they wanted to deceive the other individual just in the way they complain of having been deceived. Since there has now been brought to light that its own action and effort, the play of its powers, is taken for the real intent, consciousness seems to be occupied in its own way on its own account and not on that of others, and only to be troubled about action *qua* its own action, and not about action *qua* an action of others, and hence seems to let the others in their turn keep to their own "fact" But they go wrong again; that consciousness has already left the point where they thought it was. It is not concerned with the matter in hand as "fact" in the sense of this its own *particular* fact, but as fact *qua* fact, *qua* something universal, which is for all. Hence it interferes in the action and work of others; and if consciousness can no longer take their work out of their hands, it is at least interested in the matter, and shows this by its concern to pass judgment.

When it stamps the result with the mark of its approval and praise, this is meant to imply that in the work it does not merely praise the work itself, but at the same time its own generosity and moderation in not having destroyed the work as work nor spoiled it by finding fault. Since it shows an interest in the work, it enjoys its own self therein; and in the same way the work which it found fault with is welcomed for just this enjoyment of its own action which is thereby procured. Those, however, who regard themselves as, or profess to be, deceived by this interference from others wanted really themselves to deceive in the same way. They give out their efforts and doings as something only for themselves, in which they merely have themselves and their own nature in view. But since they do something, and thus express their nature, bring themselves to the light of day, they directly contradict by their deed the pretence of wanting to exclude the daylight, i.e. to exclude the publicity of universal consciousness, and participation by every one. Actualization is, on the contrary, an exposing of what is one's own in a universal element, where it comes to be and has to be "fact" for every one.

There is, then, as much deception of itself as of others, if it is pretended that the "bare fact" is one's sole concern. A consciousness that lays open a "fact" soon learns that others hurry to the spot and want to make themselves busy there, like flies to milk newly put out; and they in their turn find out in its case that it is not dealing with "fact" *qua* object, but with fact as "its own". On the other hand, if only action itself, the use of powers and capacities, or the expression of a given individuality, is to be the essential thing, they reciprocally learn that all are on the alert and consider themselves invited to deal with the matter, and that instead of a mere abstract action, or a single peculiar action, something has been elicited and exposed which was equally well *for others* or is a real intent. In both cases the same thing happens; and only appears to have a different significance by

contrast with that which was accepted and assumed to hold on the matter. Consciousness finds both sides to be equally essential moments, and thereby learns what the nature of the “fact of the matter”, the real intent, is, viz. that it is neither merely “fact”, which is opposed to action in general and to individual action, nor action which is opposed to permanence and is the genus independent of these moments as its species. Rather it is an essential reality whose existence means the action of the single individual and of all individuals, and whose action is immediately for others, or is a “fact”, and is only “fact” in the sense of an action of each and all — the essential reality which is the essence of all beings (*Wesen*), which is spiritual essence. Consciousness learns that no one of these moments is subject, but rather gets dissolved in the universal objectified intent. The moments of individuality, which were taken as subject one after another by this unreflective incoherent stage of consciousness, coalesce and concentrate into simple individuality, which *qua this,* is no less immediately universal. The real intent thereby ceases to stand in the relation of a predicate, loses the characteristic of lifeless abstract universality: it is substance permeated by individuality: it is subject, wherein is individuality just as much *qua* individual, or *qua* this, as *qua* all individuals: and it is the universal, which has an existence only as being this action of each and all, and gets an actual reality in that *this* consciousness knows it to be its own individual reality, and the reality of all. Pure objectified intent is what was characterized above as the “category” — being which is the ego, or ego which is being, but in the sense of thought, which is still distinguished from actual self-consciousness. Here, however, the moments of actual self-consciousness — both so far as we call them its content (purpose, action, and reality), and also in so far as we call them its form (being-for-self and being-for-another) — are made identical with the bare and simple category itself, and the category is thereby at the same time the entire content.

b

Reason as Lawgiver

Translator's comments: The next step in the development of individuality is to bring out the universal conditions of its co-existence with other individualities. This it can do because it is complete in itself, and is essentially self-conscious reason. These conditions are many, because of the diversity of its own content and of the relations in which it stands; and are yet the conditions of individuality which is one and single. Hence their plurality never implies a separation; the conditions limit each other's operation and their precise operation must be determined.

These, then, are the two stages in determining the general conditions or laws of co-existence of individuality: the enunciation of different laws by and for rational individuality, the relation of these laws *inter se*, and to the single principle from which they all proceed. Both stages owe their existence to the activity of reason. Reason promulgates laws, and criticizes, tests the validity of, the laws.

Hence the two following sections.

Reason as Lawgiver

SPIRITUAL essential reality is, in its bare existence, pure consciousness, and also *this* self-consciousness. The originally determinate nature of the individual has lost its positive significance of being inherently the element and purpose of his activity; it is merely a superseded moment, while the individual is a self in the sense of a universal self. Conversely the formal "real intent" gets its filling from active self-differentiating individuality; for the distinctions within individuality compose the content of that universal. The category is implicit (*an sich*) as the universal of pure consciousness; it

is also explicit (*für sich*), for the self of consciousness is likewise its moment. It is absolute being, for that universality is the bare self-identity of being.

Thus what is object for consciousness has (now) the significance of being the true; it *is* and it *holds good,* in the sense of being and holding good by itself as an independent entity (*an und für sich selbst*). It is the "absolute fact", which no longer suffers from the opposition of certainty and its truth, between universal and individual, between purpose and its reality, but whose existence is the reality and action of self-consciousness. This "fact" is therefore the *ethical substance;* and consciousness of it is *ethical* consciousness. Its object is likewise taken to be the truth, for it combines self-consciousness and being in a single unity. It stands for what is absolute, for self-consciousness cannot and will not again go beyond this object because it is there at home with itself: it *cannot*, for the object is all power, and all being: it *will* not, because the object is its *self,* or the will of *this* self. It is the real object inherently as object, for it contains and involves the distinction which consciousness implies. It divides itself into areas or spheres (*Massen*) which are the determinate laws of the absolute reality [viz. the ethical substance]. These spheres, however, do not obscure the notion, for the moments (being, bare consciousness and self) are kept contained within it — a unity which constitutes the inner nature of these spheres, and no longer lets these moments in this distinction fall apart from one another.

These laws or spheres (*Massen*) of the substance of ethical life are directly recognized and acknowledged. We cannot ask for their origin and justification, nor is there something else to search for as their warrant; for something other than this independent self-subsistent reality (*an und für sich seyendes Wesen*) could only be self-consciousness itself. But self-consciousness is nothing else than this reality, for itself is the self-existence

of this reality, which is the truth just because it is as much the self of consciousness as its inherent nature (*sein Ansich*), or pure consciousness.

Since self-consciousness knows itself to be a moment of this substance, the moment of self-existence (of independence and self-determination), it expresses the existence of the law within itself in the form: "the healthy natural reason knows immediately what is right and good". As healthy reason knows the law immediately, so the law is valid for it also immediately, and it says directly: "this is right and good". The emphasis is on *"this"*: there are determinate specific laws; there is the "fact itself " with a concrete filling and content.

What is thus given immediately must likewise be accepted and regarded as immediate. As in the case of the immediacy of sense-experience, so here we have also to consider the nature of the existence to which this immediate certainty in ethical experience gives expression — to analyse the constitution of the immediately existing areas (*Massen*) of ethical reality. Examples of some such laws will show what we want to know; and since we take them in the form of declarations of the healthy reason knowing them, *we*, have not, in this connexion, to introduce the moment which has to be made good in their case when looked at as immediate ethical laws.

"Every one ought to speak the truth." In this duty, as expressed unconditionally, the condition will at once be granted, viz. *if* he knows the truth. The command will therefore now run: everyone should speak the truth, at all times according to his knowledge and conviction about it. The healthy reason, this very ethical consciousness which knows immediately what is right and good, will explain that this condition had all the while been so bound up with that universal maxim that it meant the command to be taken in that sense. It thereby admits, however, in point of fact, that in the very expression of the maxim it *eo ipso* really violated it. The healthy reason *said*: "each should speak the truth"; it *intended*, however: "he must

speak the truth according to his knowledge and conviction". That is to say, it spoke otherwise than it intended, and to speak otherwise than one intends means not speaking the truth. The improved untruth, or inaptitude now takes the form: "each must speak the truth according to his knowledge and conviction about it on each occasion". Thereby, however, what was universally necessary and absolutely valid (and this the proposition wanted to express) has turned round into what is really a complete contingency. For speaking the truth is left to the chance whether I know it and can convince myself of it; and there is nothing more in the statement than that truth and falsehood are to be spoken, just as anyone happens to know, intend, and understand. This contingency in the content has universality merely in the propositional form of the expression; but as an ethical maxim the proposition promises a universal and necessary content, and thus contradicts itself by the content being contingent. Finally, if the maxim were to be improved by saying that the contingency of the knowledge and the conviction as to the truth should be dropped, and that the *truth*, too, "*ought*" to be known, then this would be a command which contradicts straightway what we started from. Healthy reason was at first assumed to have the immediate capacity of expressing the truth; now, however, we are saying that it "ought" to know the truth, i.e. that it does *not* immediately know how to express the truth. Looking at the content, this has dropped out in the demand that we "should" know the truth; for this demand refers to knowing in general— "we ought to *know*". What is demanded is, therefore, strictly speaking, something independent of every specific content. But here the whole point of the statement concerned a definite content, a distinction involved in the substance of the ethical life. Yet this immediate determination of that substance is a content of such a kind as turned out really to be a complete contingency; and when we try to get the required

universality and necessity by making the law refer to the *knowledge* [instead of to the content], then the content really disappears altogether.

Another celebrated command runs: “Love thy neighbour as thyself.” It is directed to an individual standing in relation to another individual, and asserts this law as a relation of a particular individual to a particular individual, i.e. a relation of sentiment or feeling (*Empfindung*). Active love — for an inactive love has no existence, and is therefore doubtless not intended here — aims at removing evil from someone and bringing him good. To do this we have to distinguish what the evil is, what is the appropriate good to meet this evil, and what in general his well-being consists in; i.e. we have to love him intelligently. Unintelligent love will do him harm perhaps more than hatred. Intelligent, veritable (*wesentlich*) well-doing is, however, in its richest and most important form the intelligent universal action of the state — an action compared with which the action of a particular individual as such is something altogether so trifling that it is hardly worth talking about. The action of the state is in this connexion of such great weight and strength that if the action of the individual were to oppose it, and either sought to be straightway and deliberately (*für sich*) criminal, or out of love for another wanted to cheat the universal out of the right and claim which it has upon him, such action would be useless and would inevitably be annihilated. Hence all that well-doing, which lies in sentiment and feeling, can mean is an action wholly and solely particular, a help at need, which is as contingent as it is momentary. Chance determines not merely its occasion, but also whether it is a “work” at all, whether it is not at once dissipated again, and whether it does not itself really turn to evil. Thus this sort of action for the good of others, which is given out as necessary, is so constituted that it may just as likely not exist as exist; is such that if the occasion by chance arises, it may possibly be a “work”, may possibly be good, but just as likely may not. This law, therefore, has as little

of a universal content as the first above considered, and fails to express anything substantial, something objectively real *per se* (*an und für sich*), which it should do if it is to be an absolute ethical law. In other words, such laws never get further than the *"ought to be*", they have no actual reality; they are not laws, but merely commands.

It is, however, in point of fact, clear from the very nature of the case that we must renounce all claim to an absolute universal content. For every specific determination which the simple substance (and its very nature consists in being simple) might obtain is inadequate to its nature. The command itself in its simple absoluteness expresses immediate ethical existence; the distinction appearing in it is a specific determinate element, and thus a content standing under the absolute universality of this simple existence. Since, then, an absolute content must thus be renounced, formal universality is the only kind that is possible and suitable, and this means merely that it is not to contradict itself. For universality devoid of content is formal; and an absolute content amounts to a distinction which is no distinction, i.e. means absence of content.

In default of all content there is thus nothing left with which to make a law but the bare form of universality, in fact, the mere tautology of consciousness, a tautology which stands over against the content, and consists in a knowledge, not of the content actually existing, the content proper, but of its ultimate essence only, a knowledge of its self-identity.

The ethical inner essence is consequently not itself *ipso facto* a content, but only a standard for deciding whether a content is capable of being a law or not, i.e. whether the content does not contradict itself. Reason as law-giver is reduced to being reason as criterion; instead of laying down laws reason now only tests *what is* laid down.

c

Reason as Testing Laws

A DIFFERENCE within the bare and simple ethical substance is for it an accident, which, in the case of determinate commands, as we saw, appeared as contingency in the knowledge of the circumstances and contingency in action. The comparison of that simple existence with the determinateness which was inadequate to its nature took place in us; and the simple substance was then seen to be formal universality or pure consciousness which holds itself free from and in opposition to the content, and is a knowledge of that content as something determinate. The universality in this way remains the same as what the objectified intent was. But in consciousness this universality is something different; it is no longer the genus, inert and void of thought, but is related to the particular and valid as its force and truth.

This consciousness at first seems the same process of testing which formerly *we* carried on, and its action seems unable to be anything else than has already taken place — a comparison of the universal with the determinate particular which would yield as formerly their mutual incongruity. But the relation of content to universal is different here, since this universal has got another significance. It is *formal* universality, of which the specific consent is *capable*; for in that universality the content is considered merely in relation to itself. When *we* were applying the test, the universal solid substance stood over against that specificity, which proved to be a contingent element of the consciousness into which the substance entered. *Here* one term of the comparison has vanished; the universal is no longer the existing substance with a value all its own, is no longer substantive right *per se,* but simple knowledge or form, which compares a content merely with itself, and looks at it to see if it is a tautology. Laws are no longer given, but examined and tested; and for that consciousness which applies the test the laws are already given. It picks up their content as

simply there, without going into the consideration (as was done before) of the particularity and contingency attaching to its reality; instead of this it takes its stand by the command as command, and takes up an attitude towards this command just as direct and simple as [the fact of] its being a standard and criterion for criticizing it.

For that reason, however, this process of testing does not get very far. Just because the standard is a tautology and indifferent to the content, it accepts one content just as readily as the opposite. Suppose the question is: — ought it to be a law without qualification (*an und für sich*) that there should be property? Without qualification, and not because of utility for other ends: — the essential ethical truth consists just in the fact that the law should be merely a self-consistent whole (*sich selbst gleiche*), and through being identical with itself have its ground in its own essential nature, and not be something conditioned. Property *per se* does not contradict itself. It is a specifically determinate isolated element, or merely self-identical (*sich selbst gleich*). Absence of property, absence of ownership of things, or again, community of goods, contradicts itself just as little. That something belong to nobody at all, or to the first best man who puts himself in possession, or, again, to all together, and to each according to his need or in equal portions — that is a simple characteristic, a formal thought, like its opposite, property.

If indeed no one is master of a thing and it is looked at as a necessary object for human requirement, then it is necessary that it should become the possession of some particular individual; and the contradiction would rather lie in making a law out of the freedom of the thing. By the thing being without an owner is meant, however, not absolute freedom from ownership, but that it shall come into someone's possession according to the need of the individual, and, moreover, not in order to be kept but directly to be used. But to make provision for need in such an entirely haphazard manner is

contradictory to the nature of the conscious being, with whom alone we have here to do. For such a being has to think of his need in a universal way, to look to his existence in its entirety, and procure himself a permanent lasting good. This being so, the idea that a thing is to become by chance the possession of the first self-conscious individual (*Leben*) who happens to need it, is inconsistent with itself.

In a communistic society, where provision would be made in a way which is universal and permanent, either each comes to have as much as he requires-in which case there is a contradiction between this inequality and the essential nature — of consciousness, whose principle is the equality of individuals-or, acting on this last principle, there is an equal division of goods, and in this case the share each gets has no relation to his needs, and yet this is solely what "share", i.e. fair share, really means.

But if when taken in this way absence of property seems contradictory, this is only because it has not been left in the form of a simple determinate characteristic. The same result is found in the case of property if this is resolved into separate moments. The particular thing which is my property has by being so the value of something universal, established, and permanent. This, how. ever, contradicts its nature, which consists in its being *used* and *passing away.* At the same time its value lies in being *mine*, which all others acknowledge and keep themselves away from. But just in my being acknowledged lies rather my equality, my identify, with every one — the opposite of exclusion.

Again, what I possess is a thing, i.e. an existence, which is there for others in general, quite universally and without any condition that it is for me alone. That I possess it contradicts the general nature of its thinghood. Property therefore contradicts itself on all hands just as much as absence of property; each has within it both these opposite and self-contradictory moments, universality and particularity.

But each of these determinate characteristics, presented simply as property or absence of property without further developing its implications, is as simple as the other, i.e. is not self-contradictory. The standard of law which reason has within itself therefore fits every case in the same way, and is in point of fact no standard at all. It would, too, turn out rather strange, if tautology, the principle of contradiction, which is allowed to be merely a formal criterion for knowledge of theoretical truth, i.e. something which is quite indifferent to truth and untruth alike, were to be more than this for knowledge of practical truth.

In both the above moments of what fills up the previous emptiness of spiritual reality (*geistigen Wesen*) the attempt to establish immediate determinate characteristics within the substance of the ethical life, and then to know whether these determinations are laws, has cancelled itself. The outcome, then, seems to be that neither determinate laws nor a knowledge of these can be obtained. But the substance in question is the consciousness of itself as absolute essentiality (*Wesenheit*), a consciousness therefore which can give up neither the difference falling within that substance, nor the knowledge of this difference. That giving laws and testing laws have turned out futile indicates that both, taken individually and in isolation, are merely unstable moments of the ethical consciousness; and the process in which they appear has the formal significance, that the substance of ethical life thereby expresses itself as consciousness.

So far as both these moments are more precise determinations of the consciousness of the real intent (*Sache selbst*) they can be looked on as forms of that honesty of nature (*Ehrlichkeit*) which now, as always with its formal moments, is much occupied with a content which “ought to be” good and right, and with testing definite fixed truth of this sort, and supposes itself to possess in healthy reason and intelligent insight the force and validity of ethical commands.

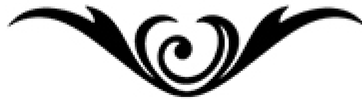
Without this honesty of nature, however, laws do not have validity as essential realities of consciousness, and the process of testing likewise does not hold good as an activity inside consciousness. Rather, these moments, when they appear directly as a reality each by itself, express in the one case an invalid establishment and mere *de facto* existence of actual laws, and in the other an equally invalid detachment from them. The law as determinate has an accidental content: this means here that it is a law made by a particular individual conscious of an arbitrary content. To legislate immediately in that way is thus tyrannical insolence and wickedness, which makes caprice into a law, and morality into obedience to such caprice — obedience to laws which are *merely* laws and not at the same time commands. So, too, the second process, testing the laws, so far as it is taken by itself, means moving the immovable, and the insolence of knowledge, which treats absolute laws in a spirit of intellectual detachment, and takes them for a caprice that is alien and external to it.

In both forms these moments are negative in relation to the ethical substance, to the real spiritual nature. In other words, the substance does not find in them its reality: but instead consciousness contains the substance still in the form of its own immediacy; and the substance is, as yet, only a process of willing and knowing on the part of *this* individual, or the ought" of an unreal command and a knowledge of formal universality. But since these modes were cancelled, consciousness has passed back into the universal and those oppositions have vanished. The spiritual reality is actual substance precisely through these modes not holding good individually, but merely as cancelled and transcended; and the unity where they are merely moments is the self of consciousness which is henceforth established within the spiritual reality, and makes that spirit concrete, actual, and self-conscious.

Spiritual reality (*das geistige Wesen*) is thus, in the first place, for self-consciousness in the shape of a law implicitly existing. The universality present in the process of testing, which was of a formal kind and not inherently existent, is transcended. The law is, too, an eternal law, which does not have its ground in the will of a given individual, but has a being all its own (*an und für sich*), the pure and absolute will of all which takes the form of immediate existence. This will is, again, not a command which merely *ought to be*; it *is* and *has* validity; it is the universal ego of the category, ego which is immediately reality, and the world is only this reality. Since, however, this existing law is absolutely valid, the obedience given by self-consciousness is not service rendered to a master, whose orders are mere caprice and in which it does not recognize its own nature. On the contrary, the laws are thoughts of its own absolute consciousness, thoughts which are its own immediate possession. Moreover, it does not believe in them, for belief, while it no doubt sees the essential nature, still gazes at an alien essence — not its own. The ethical self-consciousness is directly at one with the essential reality, in virtue of the universality of its own self. Belief, on the other hand, begins with an individual consciousness; it is a process in which this consciousness is always approaching this unity, without ever being able to find itself at home with its essential nature. The above consciousness, on the other hand, has transcended itself as individual, this mediating process is completed, and only because of this, is it immediate self-consciousness of ethical substance.

The distinction, then, of self-consciousness from the essential nature (*Wesen*) is completely transparent. Because of this the distinctions found within that nature itself are not accidental characteristics. On the contrary, because of the unity of the essence with self-consciousness (from which alone discordance, incongruity, might have come), they are articulated groups (*Massen*) of the unity permeated by its own life, unsundered spirits

transparent to themselves, stainless forms and shapes of heaven, that preserve amidst their differences the untarnished innocence and concord of their essential nature.



Self-consciousness, again, stands likewise in a simple and clear relation to those different laws. They *are*, and nothing more — this is what constitutes the consciousness of its relation to them. Thus, Antigone takes them for the unwritten and unerring laws of the god —

“Not now, indeed, nor yesterday, but for aye
It lives, and no man knows what time it came.”

They are. If I ask for their origin, and confine them to the point whence they arose, that puts me beyond them, for it is I who am now the universal, while they are the conditioned and limited. If they are to get the sanction of my insight, I have already shaken their immovable nature, their inherent constancy, and regard them as something which is perhaps true, but possibly may also be not true, so far as I am concerned. True ethical sentiment consists just in holding fast and unshaken by what is right, and abstaining altogether from what would move or shake it or derive it. Suppose a deposit has been made over to me on trust, it is the property of another, and I recognize it because it is so, and remain immovable in this relation towards it. But if I keep the deposit for myself, then, according to the principle I use in testing laws — tautology — I undoubtedly do not commit a contradiction; for in that case I do not regard it any longer as the property of another. To keep anything which I do not look on as the property, of some one else is perfectly consistent. Changing the point of view is not contradiction; for what we have to do with is not the point of view, but the object and content, which is not to contradict itself. Just as I can — as I do, when I give something away in a present — alter the view that something is mine into the view that it is the property of another, without being thereby guilty of a contradiction, so too I can proceed the

other way about. It is not, then, because I find something not contradicting itself that it is right; but it is right because it is the right. That something is the property of another, this lies at the basis of what I do. I have not to “reason why”, nor to seek out or hit upon thoughts of all kinds, connexions, aspects; I have to think neither of giving laws nor of testing them. By all such thought-processes on my part I should stultify that relation, since in point of fact I could, if I liked, make the opposite suit my indeterminate tautological knowledge just as well, and make *that* the law. But whether this or the opposite determination is the right, that is settled just as it stands (*an und für sich*). I might, for my own part, have made the law whichever I wanted, and neither of them just as well, and am, by my beginning to test them, thereby already on an immoral track. That the right is there for me just as it stands — this places me within the substance of ethical reality: and in this way that substance is the essence of self-consciousness. But self-consciousness, again is *its* actualization and its existence, its self, and its will.

VI. SPIRIT

Translator's comments: In the preceding section there is analysed the attempt on the part of individuality to operate as its own legislator and judge of laws holding for individuals. Individuality may claim the privilege of enunciating laws universal in character but having their source and inspiration solely in the single individual. Such laws can at best only be regulative and cannot be constitutive of the substance of individuality; for the substance of individuality necessarily involves other individuals within it. In short individuality is itself only realized as a part of a concrete whole of individuals: its life is drawn from common life in and with others. To attempt to enunciate laws from itself as if it could create the conditions of its own inherent universality can only issue in one result: laws are furnished without the content which gives those laws any meaning, or else the laws and the content remain from first to last external to one another. But if laws are purely formal, they cease to be i.e. constitutive conditions of individuality. Hence the attempt above described is sure to break down by its own futility. What is wanted to give the laws meaning is the concrete substance of social life: and when this concrete substance is provided *ipso facto* the attempt of individuality to create laws disappears, for these laws are already found in operation in social life. Only such laws have reality. But this involves the further step that individuality is only realized, only finds its true universal content, in and with the order of a society. Here alone is individuality what it is in truth, at once a particular focus of self-consciousness, and a realization of universal mind. This condition where individuality is conscious of itself only in and with others, and conscious of the common life as its own, is the stage of spiritual existence. Spiritual

existence and social life thus go together. The following section begins the analysis of this phase of experience, which extends from the simplest form of sociality — the Family — up to the highest experience of universal mind — Religion.

The immediately succeeding section may be taken as the keystone of the whole arch of experience traversed in the Phenomenology. Here it is pointed out that all the preceding phases of experience have not merely been preparing the way f or what is to follow, but that the various aspects, hitherto treated as separate moments of experience, are in reality abstractions from the life of concrete spirit now to be discussed and analysed.

It is noteworthy that from this point onwards the argument is less negative in its result either directly or indirectly, and is more systematic and constructive. This is no doubt largely because hitherto individual mind as such has been under review, and this is an abstraction from social mind or spiritual existence.

Spirit

REASON is spirit, when its certainty of being all reality has been raised to the level of truth, and reason is *consciously* aware of itself as its own world, and of the world as itself. The development of spirit was indicated in the immediately preceding movement of mind, where the object of consciousness, the category pure and simple, rose to be the notion of reason. When reason "observes", this pure unity of ego and existence, the unity of subjectivity and objectivity, of for-itself-ness and in-itself-ness-this unity is immanent, has the character of implicitness or of being; and consciousness of reason *finds itself.* But the true nature of "observation" is rather the transcendence of this instinct of *finding* its object lying directly at hand, and passing beyond this unconscious state of its existence. The

directly perceived (*angeshcaut*) category, the thing simply "found", enters consciousness as the self-existence of the ego-ego, which now knows itself in the objective reality, and knows itself there as the *self*. But this feature of the category, viz. of being for-itself as opposed to being — immanent — within — itself, is equally one-sided, and a moment that cancels itself. The category therefore gets for consciousness the character which it possesses in its universal truth — it is self-contained essential reality (*an und für sich seyendes Wesen*). This character, still abstract, which constitutes the nature of absolute fact, of "fact itself", is the beginnings of "spiritual reality" (*das geistige Wesen*); and its mode of consciousness is here a formal knowledge of that reality, a knowledge which is occupied with the varied and manifold content thereof. This consciousness is still, in point of fact, a particular individual distinct from the general substance, and either prescribes arbitrary laws or thinks it possesses within its own knowledge as such the laws as they absolutely are (*an und für sich*), and takes itself to be the power that passes judgment on them. Or again, looked at from the side of the substance, this is seen to be the self-contained and self-sufficient spiritual reality, which is not yet a consciousness of its own self. The self-contained and self-sufficient reality, however, which is at once aware of being actual in the form of consciousness and presents itself to itself, is Spirit.

Its essential spiritual being (*Wesen*) has been above designated as the ethical substance; spirit, however, is concrete ethical actuality (*Wirklichkeit*). Spirit is the *self* of the actual consciousness, to which spirit stands opposed, or rather which appears over against itself, as an objective actual world that has lost, however, all sense of strangeness for the self, just as the self has lost all sense of having a dependent or independent existence by itself, cut off and separated from that world. Being substance and universal self-identical permanent essence (*Wesen*), spirit is the immovable

irreducible basis and the starting point for the action of all and every one; it is their purpose and their goal, because the ideally implicit nature (*Ansich*) of all self-consciousnesses. This substance is likewise the universal product, wrought and created by the action of each and all, and constituting their unity and likeness and identity of meaning; for it is self-existence (*Fürsichseyn*), the self, action. *Qua* substance, spirit is unbending righteous selfsameness, self-identity; but *qua* for-itself, self-existent and self-determined (*Fürsichseyn*), its continuity is resolved into discrete elements, it is the self-sacrificing soul of goodness, the benevolent essential nature in which each fulfils his own special work, rends the continuum of the universal substance, and takes his own share of it. This resolution of the essence into individual forms is just the aspect of the separate action and the separate self of all the several individuals; it is the moving soul of the ethical substance, the resultant universal spiritual being. Just because this substance is a being resolved in the self, it is not a lifeless essence, but actual and alive.

Spirit is thus the self-supporting absolutely real ultimate being (*Wesen*). All the previous modes of consciousness are abstractions from it: they are constituted by the fact that spirit analyses itself, distinguishes its moments, and halts at each individual mode in turn. The isolating of such moments presupposes spirit itself and requires spirit for its subsistence, in other words, this isolation of modes only exists within spirit, which is existence. Taken in isolation they appear as if they existed as they stand. But their advance and return upon their real ground and essential being showed that they are merely moments or vanishing quantities; and this essential being is precisely this movement and resolution of these moments. Here, where spirit, the reflexion of these moments into itself, has become established, our reflexion may briefly recall them in this connexion: they were consciousness, self-consciousness, and reason. Spirit is thus *Consciousness*

in general, which contains sense-certainty, perception and understanding, so far as in analysing its own self it holds fast by the moment of being a reality objective to itself, and by abstraction eliminates the fact that this reality is its own self objectified, its own self-existence. When again it holds fast by the other abstract moment produced by analysis, the fact that its object is its own self become objective to itself, is its self-existence, then it is *Self-consciousness*. But as immediate consciousness of its inherent and its explicit being, of its immanent self and its objective self, as the unity of consciousness and self-consciousness, it is that type of consciousness which has Reason: it is the consciousness which, as the word "have" indicates, has the object in a shape which is implicitly and inherently rational, or is categorized, but in such a way that the object is not yet taken by the consciousness in question to have the value of a category. Spirit here is that consciousness from the immediately preceding consideration of which we have arrived at the present stage. Finally, when this reason, which spirit "*has*", is seen by spirit to be reason which actually *is*, to be reason which is actual in spirit, and is its world, then spirit has come to its truth; it *is* spirit, the essential nature of ethical life actually existent.

Spirit, so far as it is the immediate, truth, is the ethical life of a nation: — the individual, which is a world. It has to advance to the consciousness of what it is immediately; it has to abandon and transcend the beautiful simplicity of ethical life, and get to a knowledge of itself by passing through a series of stages and forms. The distinction between these and those that have gone before consists in their being real spiritual individualities (*Geister*), actualities proper, and instead of being forms merely of consciousness, they are forms of a world.

The living ethical world is spirit in its truth. As it first comes to an abstract *knowledge* of its essential nature, ethical life (*Sittlichkeit*) is destroyed in the formal universality of right or legality (*Recht*). Spirit, being

now sundered within itself, traces one of its worlds in the element of its objectivity as in a crass solid actuality; this is the realm of Culture and Civilization; while over against this in the element of thought is traced the world of Belief or Faith, the realm of the.Inner Life and Truth (*Wesen*). Both worlds, however, when in the grip of the notion — when grasped by spirit which, after this loss of self through self-diremption, penetrates itself — are thrown into confusion and revolutionized through individual Insight (*Einsicht*), and the general diffusion of this attitude, known as the "Enlightenment" (*Aufklärung*). And the realm which had thus been divided and expanded into the "present" and the "remote beyond", into the "here" and the "yonder", turns back into self-consciousness. This self-consciousness, again, taking now the form of Morality (the *inner moral* life) apprehends itself as the essential truth, and the real essence as its actual self no longer puts its world and its ground and basis away outside itself, but lets everything fade into itself, and in the form of Conscience (*Gewissen*) is spirit sure and certain (*gewiss*) of itself.

The ethical world, the world rent asunder into the "here" and the "yonder", and the moral point of view (*moralische Weltanschauung*), are, then, individual forms of spirit (*Geister*) whose process and whose return into the self of spirit, a self simple and self-existent (*fürsichseyend*), will be developed. As these attain their goal and final result, the actual self-consciousness of Absolute Spirit will make its appearance and be their outcome.

A

Objective Spirit — The Ethical Order

Spirit, in its ultimate simple truth, is consciousness, and breaks asunder its moments from one another. An act divides spirit into spiritual substance on the one side, and consciousness of the substance on the other; and divides the substance as well as consciousness. The substance appears in the shape of a universal inner nature and purpose standing in contrast to itself *qua* individualized reality. The middle or mediating term, infinite in character, is self-consciousness, which, being *implicitly* the unity of itself and that substance, becomes so, now, explicitly (*für sich*), unites the universal inner nature and its particular realization, raises the latter to the former and acts *ethically*: and, on the other hand, brings the former down to the latter and carries out the purpose, the substance presented merely in thought. In this way it brings to light the unity of its self and the substance, and produces this unity in the form of its "work", and thus as actual concrete fact (*Wirklichkeit*).

When consciousness breaks up into these elements, the simple substance has in part acquired the attitude of opposition to self-consciousness; in part it thereby manifests in itself the very nature of consciousness, which consists in distinguishing its own content within itself — manifests it as a world articulated into its spheres, The substance is thus an ethical being split up into distinct elemental forms, a human and a divine law. In the same way, the self-consciousness appearing over against the substance assigns itself, in virtue of its inner nature, to one of these powers, and, *qua* involving knowledge, gets broken up into ignorance of what it is doing, on the one hand, and knowledge of this on the other, a knowledge which for that reason proves a deception. It learns, therefore, through its own act at once the contradictory nature of those powers into which the inner substance divided itself, and their mutual overthrow, as well as the contradiction between its knowledge of the ethical character of its act and what is truly and essentially ethical, and so finds *its own* destruction. In

point of fact, however, the ethical substance has by this process become actual concrete self-consciousness: in other words this particular self has become self-sufficient and self-dependent — (*Anund Fürsichseyenden*), but precisely thereby the ethical order has been overthrown and destroyed.

1. Der wahre Geist.
2. Sittlichkeit.

a

The Ethical World: Law Human and Divine: Man and Woman

Translator's comments: The first step in the analysis of spirit is to take spirit as a realized actual social order, immediately given as a historical fact, and present directly to the minds of the individuals composing it. This is social life as an established routine of human adjustments, where the natural characteristics and constitution of its moral individuals are absorbed and built into the single substance of the living social whole. It is spirit as an objectively embodied whole of essentially spiritual individuals, without any consciousness of opposition to one another or to the whole, and with an absolute unbroken sense of their own security and fulfilment within the substance of social mind. It is spirit at the level of naive acquiescence in the law and order of conventional life.

But such a self-complete type of experience has various levels of realization. It cannot exist except through the union of opposing elements; and the central principle of all experience, self-consciousness, which assumes here such a concrete form, has abundant material on which to exercise its function of creating and uniting distinctions. The first level is determined by the fact that the substance of social life is constituted out of the quasi-natural phenomena of human genus and species, of race and nationality, on the one hand, and the purely natural element of specialized

individual sex on the other. These two aspects go together; the sex-relations of individuals maintain race and nationality, the nation lives in and through its sexually distinct individuals. The social order as an order is realized and maintained in the medium of these elements. The fact that this order is an order of universal mind gives it a permanence, an inviolability, an absoluteness, which are inseparable from it, so inseparable that the order is looked on as having its roots in the Absolute Mind, and as deriving its authority from it. The social order on this aspect consists of a divinely established and divinely sanctioned *régime*; the gods are the guardians of the city, of the hearth and the home. On the other hand the expression of this order varies, and is enunciated from time to time in the history of a community. The order in this sense is made by man; the law of the social order thus becomes a human law, determined by human conditions and human ends; it is a round of conventions and customs. These two forms of order are inseparable in the life of a community, and they subsist together and side beside at this level of social consciousness. They may lead to conflict in the life of the individual in the community, and have to be reconciled by force or otherwise; and they become associated and connected with the fundamental differences of individuality above referred to.

The analysis of this level of social life constituted as above furnishes the argument of the following section. With Hegel's treatment of the relationships holding between Husband and Wife, Parents and Children, Brothers and Sisters should be read Aristotle's discussion of social fellowship in Eth. Nicom. Bks. VIII, IX.

The Ethical World: Law Human and Divine: Man and Woman

THE simple substance of spirit, being consciousness, divides itself into parts. In other words, just as consciousness of abstract sensuous existence passes over into perception, so does immediate certainty of real ethical existence; and just as for sense-perception bare "being" becomes a "thing" with many properties, so for ethical perception a given act becomes a reality involving many ethical relations. For the former, again, the unnecessary plurality of properties concentrates itself into the form of an essential opposition between individual and universal; and still more for the latter, which is consciousness purified and substantial, the plurality of ethical moments is reduced to and assumes a twofold form, that of a law of individuality and a law of universality. Each of these areas or "masses" of the substance remains, however, spirit in its entirety. If in sense-perception "things" have no other substantial reality than the two determinations of individual and universal, these determinations express, in the present instance, merely the superficial opposition of both sides to one another.

Individuality, in the case of the subject (*Wesen*) we are here considering, has the significance of self-consciousness in general, not of any particular consciousness we care to take. The ethical substance is, thus, in this determination actual concrete substance, Absolute Spirit realized in the plurality of distinct consciousnesses definitely existing. It [this spirit] is the community (*Gemeinwesen*) which, as we entered the stage of the practical embodiment of reason in general, came before us as the absolute and ultimate reality, and which here comes objectively before itself in its true nature as a conscious ethical reality (*Wesen*), and as the essential reality for that mode of consciousness we are now dealing with. it is spirit which is *for itself,* since it maintains itself by being reflected in the minds of the component individuals; and which is *in itself* or substance, since it preserves them within itself. *Qua* actual substance, that spirit is a Nation (*Volk*); *qua* concrete consciousness, it is the Citizens of the nation. This consciousness

has its essential being in simple spirit, and is certain of itself in the actual realization of this spirit, in the entire nation; it has its truth there directly, not therefore in something unreal, but in a spirit which exists and makes itself felt.

This spirit can be named Human Law, because it has its being essentially in the form of self-conscious actuality. In the form of universality, that spirit is the law known to everybody, familiar and recognized, and is the everyday Customary Convention (*Sitte*); in the form of particularity it is the concrete certainty of itself in any and every individual; and the certainty of itself as a single individuality is that spirit in the form of Government. Its true and complete nature is seen in its authoritative validity openly and unmistakably manifested, an existence which takes the form of unconstrained independent objective fact, and is immediately apprehended with conscious certainty in this form.

Over against this power and publicity of the ethical secular human order there appears, however, another power, the Divine Law. For the ethical power of the state, being the movement of self-conscious action, finds its opposition in the simple immediate essential being of the ethical order; *qua* actual concrete universality, it is a force exerted against the independence of the individual; and, *qua* actuality in general, it finds inherent in that essential being something other than the power of the state.

We mentioned before that each of the opposite ways in which the ethical substance exists contains that substance in its entirety, and contains all moments of its contents. If, then, the community is that substance in the form of self-consciously realized action, the other side has the form of immediate or directly existent substance. The latter is thus, on the one band, the inner principle (*Begriff*) or universal possibility of the ethical order in general, but, on the other hand, contains within it also the moment of self-consciousness. This moment which expresses the ethical order in this

element of immediacy or mere being, which, in other words, is an immediate consciousness of self (both as regards its essence and its particular thisness) in an other" — and hence, is a *natural* ethical community — this is the *Family*. The family, as the inner indwelling principle of sociality operating in an unconscious way, stands opposed to its own actuality when explicitly conscious; as the basis of the actuality of a nation, it stands in contrast to the nation itself; as the *immediate* ethical existence, it stands over against the ethical order which shapes and preserves itself by work for universal ends; the Penates of the family stand in contrast to the universal spirit.

Although the ethical existence of the family has the character of immediacy, it is within itself an *ethical* entity, but not so far as it is the natural relation of its component members, or so far as their connexion is one immediately holding between individual concrete beings. For the *ethical* element is intrinsically universal and this relation established by nature is essentially just as much a spiritual fact, and is only ethical by being spiritual. Let us see wherein its peculiar ethical character consists.

In the first place, because the ethical element is the intrinsically universal element, the *ethical* relation between the members of the family is not that of sentiment or the relationship of love. The ethical element in this case seems bound to be placed in the relation of the individual member of the family to the *entire* family as the real substance, so that the purpose of his action and the content of his actuality are taken from this substance, are derived solely from the family life. But the conscious purpose which dominates the action of this whole, so far as that purpose concerns that whole, is itself the individual member. The procuring and maintaining of power and wealth turn, in part, merely on needs and wants, and are a matter that has to do with desire; in part, they become in their higher object something which is merely of mediate significance. This object does not fall

within the family itself, but concerns what is truly universal, the community; it acts rather in a negative way on the family, and consists in setting the individual outside the family, in subduing his merely natural existence and his mere particularity and so drawing him on towards virtue, towards living in and for the universal. The positive purpose peculiar to the family is the individual as such. Now in order that this relationship may be ethical, neither the individual who does an act, nor he to whom the act refers must show any trace of contingency such as obtains in rendering some particular help or service. The content of the ethical act must be substantial in character, or must be entire and universal; hence it can only stand in relation to the entire individual, to the individual *qua* universal. And this, again, must not be taken as if it were merely in idea that an act of service furthered his entire happiness, whereas the service, taken as an immediate or concrete act, only does something particular in regard to him. Nor must we think that the ethical act, like a process of education, really takes him as its object, and, dealing with him as a whole, in a series of efforts, produces him as a kind of work; for there, apart from the purpose, which operates in a negative way on the family, the real act has merely a limited content. Finally, just as little should we take it that the service rendered is a help in time of need, by which in truth the entire individual is saved; for such help is itself an entirely casual act, the occasion of which is an ordinary actuality which can as well be as not be. The act, then, which embraces the entire existence of the blood relation does not concern the citizen, for he does not belong to the family, nor does it deal with one who is going to be a citizen and so will cease to have the significance of a mere particular individual: it has as its object and content this specific individual belonging to the family, takes him as a universal being, divested of his sensuous, or particular reality. The act no longer concerns the living but the dead, one who has passed through the long sequence of his broken and

diversified existence and gathered up his being into its one completed embodiment, who has lifted himself out of the unrest of a life of chance and change into the peace of simple universality. Because it is only as citizen that he is real and substantial, the individual, when not a citizen, and belonging to the family, is merely unreal insubstantial shadow.

This condition of universality, which the individual *as such* reaches, is mere being, death; it is the immediate issue of the process of nature, and is not the action of a conscious mind. The duty of the member of a family is on that account to attach this aspect too, in order that this last phase of being also (this universal being), may not belong to nature alone, and remain something irrational, but may be something actually *done*, and the right of consciousness be asserted in it. Or rather the significance of the act is that, because in truth the peace and universality of a self-conscious being does not belong to nature, the apparent claim which nature has made to act in this way may be given up and the truth reinstated.

What nature did in the individual's case concerns the aspect in which his process of becoming universal is manifested as the movement of an existent. It takes effect no doubt within the ethical community, and has this in view as its purpose: death is the fulfilment and highest task which the individual as such undertakes on its behalf. But so far as he is essentially a particular individual, it is an accident that his death was connected directly with his labour for the universal whole, and was the outcome of his toil; partly because, if it was so, it is the *natural* course of the negativity of the individual *qua* existent, in which consciousness does not return into itself and become self-conscious; or, again, because, since the process of the existent consists in becoming cancelled and transcended and attaining the stage of independent self-existence, death is the aspect of diremption, where the self-existence, which is obtained, is something other than that being which entered on the process.

Because the ethical order is spirit in its immediate truth, those aspects into which its conscious life breaks up fall also into this form of immediacy; and the individual's particularity passes over into this abstract negativity, which, being in itself without consolation or reconcilement, must receive them essentially through a concrete and external act.

Blood-relationship therefore supplements the abstract natural process by adding to it the process of consciousness, by interrupting the work of nature, and rescuing the blood-relation from destruction; or better, because destruction, the passing into mere being, is necessary, it takes upon itself the act of destruction.

Through this it comes about that the universal being, the sphere of death, is also something which has returned into itself, something self-existent; the powerless bare particular unity is raised to universal individuality. The dead individual, by his having detached and liberated his being from his action or his negative unity, is an empty particular, merely existing passively for some other, at the mercy of every lower irrational organic agency, and the [chemical, physical] forces of abstract material elements, both of which are now stronger than himself, the former on account of the life which they have, the latter on account of their negative nature. The family keeps away from the dead this dishonouring of him by the desires of unconscious organic agencies and by abstract elements, puts its own action in place of theirs, and weds the relative to the bosom of the earth, the elemental individuality that passes not away. Thereby the family makes the dead a member of a community which prevails over and holds under control the powers of the particular material elements and the lower living creatures, which sought to have their way with the dead and destroy him.

This last duty thus accomplishes the complete divine law, or constitutes the positive ethical act towards the given individual. Every other relation towards him which does not remain at the level of love, but is ethical,

belongs to human law, and has the negative significance of lifting the individual above the confinement within the natural community to which he belongs as a concrete individual. But, now, though human right has for its content and power the actual ethical substance consciously aware of itself, the entire nation, while divine right and law derive theirs from the particular individual who is beyond the actual, yet he is still not without power. His power lies in the abstract pure universal, the elemental individual, which seizes upon the individuality that cuts itself loose from the element and constitutes the self-conscious reality of the nation, and draws it back into the pure abstraction which is its essential nature: draws it back just as that essence is its ultimate ground and source. How this power is made explicit in the nation itself will come out more fully as we proceed.

Now in the one law as in the other there are differences and stages. For since these laws involve the element of consciousness in both cases, distinction is developed within themselves: and this is just what constitutes the peculiar process of their life. The consideration of these differences brings out the way they operate, and the kind of self-consciousness at work in both the universal essential principles (*Wesen*) of the ethical world, as also their connexion and transition into one another.

The community, the upper law whose validity is open to the light of day, has its concrete vitality in government; for in government it is an individual whole. Government is concrete actual spirit reflected into itself, the self pure and simple of the entire ethical substance. This simple force allows, indeed, the community to unfold and expand into its component members, and to give each part subsistence and self-existence of its own (*Fürsichseyn*). Spirit finds in this way its realization or its objective existence, and the family is the medium in which this realization takes effect. But spirit is at the same time the force of the whole, combining these parts again within the unity which negates them, giving them the feeling of

their want of independence, and keeping them aware that their life only lies in the whole. The community may thus, on the one hand, organize itself into the systems of property and of personal independence, of personal right and right in things; and, on the other hand, articulate the various ways of working for what in the first instance are particular ends — those of gain and enjoyment — into their own special guilds and associations, and may thus make them independent. The spirit of universal assemblage and association is the single and simple principle, and the negative essential factor at work in the segregation and isolation of these systems. In order not to let them get rooted and settled in this isolation and thus break up the whole into fragments and let the common spirit evaporate, government has from time to time to shake them to the very centre by War. By this means it confounds the order that has been established and arranged, and violates their right to independence, while the individuals (who, being absorbed therein, get adrift from the whole, striving after inviolable self-existence (*Fürsichseyn*) and personal security), are made, by the task thus imposed on them by government, to feel the power of their lord and master, death. By thus breaking up the form of fixed stability, spirit guards the ethical order from sinking into merely natural existence, preserves the self of which it is conscious, and raises that self to the level of freedom and its own powers. The negative essential being shows itself to be the might proper of the community and the force it has for self-maintenance. The community therefore finds the true principle and corroboration of its power in the inner nature of divine law, and in the kingdom of the nether world.

The divine law which holds sway in the family has also on its side distinctions within itself, the relations among which make up the living process of its realization. Amongst the three relationships, however, of husband and wife, parents and children, brothers and sisters, the relationship of husband and wife is to begin with the primary and

immediate form in which one consciousness recognizes itself in another, and in which each knows that reciprocal recognition. Being natural self-knowledge, knowledge of self on the basis of nature and not on that of ethical life, it merely represents and typifies in a figure the life of spirit, and is not spirit itself actually realized. Figurative representation, however, has its reality in an other than it is. This relationship, therefore, finds itself realized not in itself as such, but in the child — an other, in whose coming into being that relationship consists, and with which it passes away. And this change from one generation onwards to another is permanent in and as the life of a nation.

The reverent devotion (*Pietät*) of husband and wife towards one another is thus mixed up with a natural relation and with feeling, and their relationship is not inherently self-complete; similarly, too, the second relationship, the reverent devotion of parents and children to one another. The devotion of parents towards their children is affected with emotion just by their being consciously realized in what is external to themselves (viz. the children), and by their seeing them become something on their own account without this returning to the parents; independent existence on the part of the children remains a foreign reality, a reality all their own. The devotion of children, again, towards their parents is conversely affected by their coming into being from, or having their essential nature in, what is external to themselves (viz. the parents) and passes away; and by their attaining independent existence and a self-consciousness of their own solely through separation from the source whence they came — a separation in which the spring gets exhausted.

Both these relationships are constituted by and hold within the transience and the dissimilarity of the two sides, which are assigned to them.

An unmixed intransitive form of relationship, however, holds between brother and sister. They are the same blood, which, however, in them has

entered into a condition of stable equilibrium. They therefore stand in no such natural relation as husband and wife, they do not desire one another; nor have they given to one another, nor received from one another, this independence of individual being; they are free individualities with respect to each other. The feminine element, therefore, in the form of the sister, premonizes and foreshadows most completely the nature of ethical life (*sittliches Wesen*). She does not become conscious of it, and does not actualize it, because the law of the family is her inherent implicit inward nature, which does not lie open to the daylight of consciousness, but remains inner feeling and the divine element exempt from actuality. The feminine life is attached to these household divinities (*Penates*), and sees in them both her universal substance, and her particular individuality, yet so views them that this relation of her individuality to them is at the same time not the natural one of pleasure.

As a daughter, the woman must now see her parents pass away with natural emotion and yet with ethical resignation, for it is only at the cost of this condition that she can come to that individual existence of which she is capable. She thus cannot see her independent existence positively attained in her relation to her parents. The relationships of mother and wife, however, are individualized partly in the form of something natural, which brings pleasure; partly in the form of something negative, which finds simply its own evanescence in those relationships; partly again the individualization is just on that account something contingent which can be replaced by an other particular individuality. In a household of the ethical kind, a woman's relationships are not based on a reference to this particular husband, this particular child but to a husband, to children *in general* — not to feeling, but to the universal. The distinction between her ethical life (*Sittlichkeit*) (while it determines her particular existence and brings her pleasure) and that of her husband consists just in this, that it has always a

directly universal significance for her, and is quite alien to the impulsive condition of mere particular desire. On the other hand, in the husband these two aspects get separated; and since he possesses, as a citizen, the self-conscious power belonging to the universal life, the life of the social whole, he acquires thereby the rights of desire, and keeps himself at the same time in detachment from it. So far, then, as particularity is implicated in this relationship in the case of the wife, her ethical life is not purely ethical; so far, however, as it is ethical, the particularity is a matter of indifference, and the wife is without the moment of knowing herself as *this* particular self in and through an other.

The brother, however, is in the eyes of the sister a being whose nature is unperturbed by desire and is ethically like her own; her recognition in him is pure and unmixed with any sexual relation. The indifference characteristic of particular existence and the ethical contingency thence arising are, therefore, not present in this relationship; instead, the moment of individual selfhood, recognizing and being recognized, can here assert its right, because it is bound up with the balance and equilibrium resulting from their being of the same blood, and from their being related in a way that involves no mutual desire. The loss of a brother is thus irreparable to the sister, and her duty towards him is the highest.

This relationship at the same time is the limit, at which the circumscribed life of the family is broken up, and passes beyond itself. The brother is the member of the family in whom its spirit becomes individualized, and enabled thereby to turn towards another sphere, towards what is other than and external to itself, and pass over into consciousness of universality. The brother leaves this immediate, rudimentary, and, therefore, strictly speaking, negative ethical life of the family, in order to acquire and produce the concrete ethical order which is conscious of itself.

He passes from the divine law, within whose realm he lived, over to the human law. The sister, however, becomes, or the wife remains, director of the home and the preserver of the divine law. In this way both the sexes overcome their merely natural being, and become ethically significant, as diverse forms dividing between them the different aspects which the ethical substance assumes. Both these universal factors of the ethical world have their specific individuality in naturally distinct self-consciousnesses, for the reason that the spirit at work in the ethical order is the immediate unity of the substance [of ethical life] with self-consciousness — an immediacy which thus appears as the existence of a natural difference, at once as regards its aspect of reality and of difference. It is that aspect which, in the notion of spiritual reality, came to light as "original determinate nature", when we were dealing with the stage of "Individuality which is real to itself". This moment loses the indeterminateness which it still has there, and the contingent diversity of "constitution" and "capacities". It is now the specific opposition of the two sexes, whose natural character acquires at the same time the significance of their respective ethical determinations.

The distinction of the sexes and of their ethical content remains all the same within the unity of the ethical substance, and its process is just the constant development of that substance. The husband is sent forth by the spirit of the family into the life of the community, and finds there his self-conscious reality. Just as the family thereby finds in the community its universal substance and subsistence, conversely the community finds in the family the formal element of its own realization, and in the divine law its power and confirmation. Neither of the two is alone self-complete. Human law as a living and active principle proceeds from the divine, the law holding on earth from that of the nether world, the conscious from the unconscious, mediation from immediacy; and returns too whence it came.

The power of the nether world, on the other hand, finds its realization upon earth; it comes through consciousness to have existence and efficacy.

The universal elements of the ethical life are thus the (ethical) substance *qua* universal, and that substance *qua* particular consciousness. Their universal actuality is the nation and the family; while they get their natural self, and their operative individuality, in man and woman. Here in this content of the ethical world we see attained those purposes which the previous insubstantial modes of conscious life set before them. What Reason apprehended only as an object has become Self-consciousness, and what self-consciousness merely contained within it is here explicit true reality. What Observation knew — an object given externally and picked up, and one in the constitution of which the subject knowing had no share — is here a given ethical condition, a custom found lying ready at hand, but a reality which is at the same time the deed and product of the subject finding it. The individual who seeks the "pleasure" of enjoying his particular individuality finds it in the family life, and the "necessity" in which that pleasure passes away is his own self-consciousness as a citizen of his nation. Or, again, it is knowing the "law of his own heart" as the law of all hearts, knowing the, consciousness of self to be the recognized and universal ordinance of society: it is "virtue", which enjoys the fruits of its own sacrifice, which brings about what it sets out to do, viz. to bring the essential nature into the light of the actual present — and its enjoyment is this universal life. Finally, consciousness of "fact as such" (*der Sache selbst*) gets satisfaction in the real substance, which contains and maintains in positive form the abstract aspects of that empty category. That substance finds a genuine content in the powers of the ethical order, a content that takes the place of those insubstantial commands which the "healthy human reason" wanted to give and to know: and in consequence thus gets a

concrete inherently determinate standard for "testing", not the laws, but what is done.

The whole is a stable equilibrium of all the parts, and each part a spirit in its native element, a spirit which does not seek its satisfaction beyond itself, but has the satisfaction within itself for the reason that itself is in this balanced equipoise with the whole. This condition of stable equilibrium can, doubtless, only be living by inequality arising within it, and being brought back again to equipoise by Righteousness and Justice. Justice, however, is neither an alien principle (*Wesen*) holding somewhere remote from the present, nor the realization (unworthy of the name of justice) of mutual malice, treachery, ingratitude, etc., which, in the unintelligent way of chance and accident, would fulfil the law by a kind of irrational connexion without any controlling idea, action by commission and omission, without any consciousness of what was involved. On the contrary, being justice in human law, it brings back to the whole, to the universal life of society, what has broken away separately from the harmony and equilibrium of the whole: — the independent classes and individuals. In this way justice is the government of the nation, and is its all-pervading essential life in a consciously present individual form, and is the personal self-conscious will of all.

That justice, however, which restores to equilibrium the universal when getting the mastery over the particular individual, is similarly the simple single spirit of the individual who has suffered wrong; it is not broken up into the two elements, one who has suffered wrong and a far-away remote reality (*Wesen*). The individual himself is the power of the "nether" world, and that reality is *his* "fury", wreaking vengeance upon him. For his individuality, his blood still lives in the house, his substance has a lasting actuality. The wrong, which can be brought upon the individual in the realm of the ethical world, consists merely in this, that a bare something by

chance happens to him. The power which perpetrates on the conscious individual this wrong of making him into a mere thing is “nature” it is the universality not of the community, but the abstract universality of mere existence. And the particular individual, in wiping out the wrong suffered, turns not against the community — for he has not suffered at its hands — but against the latter. As we saw, the consciousness of those who share the blood of the individual removes this wrong in such a way that what has happened becomes rather a work of their own doing, and hence bare existence, the last state, gets also to be something willed, and thus an object of gratification.

The ethical realm remains in this way permanently a world without blot or stain, a world untainted by any internal dissension. So, too, its process is an untroubled transition from one of its powers to the other, in such a way that each preserves and produces the other. We see it no doubt divided into two ultimate elements and their realization: but their opposition is rather the confirming and substantiation of one through the other; and where they directly come in contact with each other as actual factors, their mediating common element is the immediate permeation of the one with the other. The one extreme, universal spirit conscious of itself, becomes, through the individuality of man, linked together with its other extreme, its force and its element, with *unconscious* spirit. On the other hand, divine law is individualized, the unconscious spirit of the particular individual finds its existence, in woman, through the mediation of whom the unconscious spirit comes out of its unrealizedness into actuality, and rises out of the state of unknowing and unknown, into the conscious realm of universal spirit. The union of man with woman constitutes the operative mediating agency for the whole, and constitutes the element which, while separated into the extremes of divine and human law, is, at the same time, their immediate union. This union, again, turns both those first mediate connexions

(*Schlusse*) into one and the same synthesis, and unites into one process the twofold movement in opposite directions-one from reality to unreality, the downward movement of human law, organized into independent members, to the danger and trial of death,-the other, from unreality to reality, the upward movement of the law of the nether world to the daylight of conscious existence. Of these movements the former falls to man, the latter to woman.

b

Ethical Action. Knowledge, Human and Divine. Guilt and Destiny

Translator's comments: A fundamental condition of social order is that it is maintained by action on the part of the individual members of a society; action is a fundamental principle of distinction between individuals, is the way they make their contribution to social life, and is also the way by which the continuance of social life is ceaselessly broken and reconstituted. In a comprehensive sense therefore action is the principle by which distinction in unity is carried out in social life. The consideration of its significance is thus an essential problem of social mind. Action must be considered at once with reference to individuality and also with reference to those conceptions of social order as containing both "divine" and "human" law. In the following section, this analysis is undertaken.

The specific historical background of Hegel's thought in this section, and to some extent in the preceding section, is supplied by the social life of the Greek city state. The Greek city state has been taken as the type, so to say, of spiritual existence realized as a self-complete ethical order. But the social life of Greece is here in large measure read and interpreted in the light of the dramatization of Greek ethical conceptions by the great Greek tragedians, especially Sophocles. This accounts for the repeated reference to

the purely dramatic conception of the "destiny" or the "pathic" element in the life of the individual whose spiritual existence is completely bound up with the established social order. It is in Greece that we find most fully realized the all-sufficiency of the state for the individual, which Hegel has here in view, a sufficiency which was at once the strength and beauty, as well as the pathos and weakness, of Greek social life.

With this and the preceding section should be read Hegel's *Philosophy of History,* Part II, "The Greek World".

Ethical Action. Knowledge, Human and Divine. Guilt and Destiny

IN the form presented by the opposition of elements in the realm just dealt with, self-consciousness has not yet come to its rights as a single individuality. Individuality there has, on one side, the sense of merely universal will, on the other, of consanguinity of the family. *This* particular individual has merely the significance of shadowy unreality. There is as yet no performance of an act. The act, however, is the realized self. It breaks in upon the untroubled stable organization and movement of the ethical world. What there appears as ordinance and harmony between both its constituent elements, each of which confirms and complements the other, becomes through the performing of an act a transition of opposites into one another, by which each proves to be the annihilation rather than the confirmation of its self and its opposite. It becomes the process of negation or destruction, the eternal necessity of awful destiny, which engulfs in the abyss of its bare identity divine and human law alike, as well as both the self-conscious factors in which these powers subsist; and, to our view, passes over into the absolute self-existence of mere single self-consciousness.

The basis from which this movement proceeds, and on which it takes effect, is the kingdom of the ethical order. But the activity at work in this

process is self-consciousness. Being ethical consciousness, it is the pure and simple direction of activity towards the essential principle of the ethical life — it is *Duty*. There is no caprice, and likewise no struggle, no indecision in it, since it has given up legislating and testing laws: the essential ethical principle is, for it, something immediate, unwavering, without contradiction. There is therefore neither the painful spectacle of finding itself in a collision between passion and duty, nor the comic spectacle of a collision between duty and duty — a collision, which so far as content goes is the same as that between passion and duty; for passion can also be presented as a duty, because duty, when consciousness withdraws into itself and leaves its immediate essential, substance (*Wesenheit*), comes to be the formal universal, into which one content fits equally well with another, as we found before. The collision of duties is, however, comical, because it brings out the contradiction inherent in the idea of an absolute standing opposed to another absolute, expresses something absolute and then directly the annihilation of this so-called absolute or duty. The ethical consciousness, however, knows what it has to do; and is decided, whether it is to belong to divine or human law. This directness which characterizes its decision is something immanent and inherent (*Ansichseyn*), and hence has at the same time the significance of a natural condition of being, as we saw. Nature, not the accident of circumstances or choice, assigns one sex to one law the other to the other law; or conversely both the ethical powers themselves establish their individual existence and actualization in the two sexes.

Thus, then, because on the one side the ethical order consists essentially in this immediate directness of decision, and therefore only the one law is *for consciousness* the essential reality; while, on the other side, the powers of the ethical order are actual in the self of conscious life — in this way these forces acquire the significance of excluding one another and of being

opposed to one another. They are explicit in self-consciousness just as they were merely implicit in the realm of the ethical order. The ethical consciousness, because it is decisively on the side of one of them, is essentially *Character*. There is not for it equal essentiality in both. The opposition therefore appears as an unfortunate collision of duty merely with reality, on which right has no hold. The ethical consciousness is *qua* self-consciousness in this opposition, and being so, it at once proceeds either to subdue by force this reality opposed to the law which it accepts, or to get round this reality by craft. Since it sees right only on its own side, and wrong on the other, so, of these two, that which belongs to divine law detects, on the other side, mere arbitrary fortuitous human violence, while what appertains to human law finds in the other the obstinacy and disobedience of subjective self-sufficiency. For the commands of government have a universal sense and meaning open to the light of day; the will of the other law, however, is the inner concealed meaning of the realm of darkness (*unterirdisch*), a meaning which appears expressed as the will of a particular being, and in contradicting the first is malicious offence.

There arises in this way in consciousness the opposition between what is known and what is not known, just as, in the case of substance, there was an opposition between the conscious and the unconscious; and the absolute right of ethical self-consciousness comes into conflict with the divine right of the essential reality. Self-consciousness, *qua* consciousness, takes the objective actuality, as such, to have essential being. Looking at its substance, however, it is the unity of itself and this opposite, and the ethical self-consciousness is consciousness of that substance: the object, *qua* opposed to self-consciousness, has, therefore, entirely lost the characteristic of having essential being by itself. Just as the spheres [of conscious life] where the object is merely a “thing” are long past and gone, so, too, are these spheres, where consciousness sets up and establishes something from

out itself, and turns a particular moment into the essential reality (*Wesen*). Against such one-sidedness actual concrete reality has a power of its own; it takes the side of truth against consciousness and shows consciousness itself what the truth is. The ethical consciousness, however, has drunk from the cup of the absolute substance, forgotten all the one-sidedness of isolating self-existence, all its purposes and peculiar notions, and has, therefore, at the same time drowned in this Stygian stream all essentiality of nature and all the independence claimed by the objective reality. Its absolute right, therefore, when it acts in accordance with ethical law, is to find in this actualization nothing else than the fulfilment and performance of this law itself: and that the deed should manifest nothing but ethical action.

The ethical, being absolute essence and absolute power at once, cannot endure any perversion of its content. If it were merely absolute essence without power, it might undergo perversion at the hands of individuality. But this latter, being ethical consciousness, has renounced all perverting when it gave up its one-sided subjectivity (*Fürsichseyn*). Conversely, again, mere power might be perverted by the essential reality, if power were still a subjectivity of that kind. On account of this unity, individuality is a pure form of the substance which is the content, and action consists in transition from thought over into reality, merely as the process of an unreal opposition, whose moments have no special and particular content distinct from one another, and no essential nature of their own. The absolute right of ethical consciousness is, therefore, that the deed, the mode and form of its realization, should be nothing else than it *knows.*

But the essential ethical reality has split asunder into two laws, and consciousness, taking up an undivided single attitude towards law, is assigned only to one. Just as this simple consciousness takes its stand on the absolute right that the essential reality has appeared to it *qua* ethical as that reality inherently is, so, too, this essence insists on the right belonging to its

reality, i.e. the right of having a double form. This right of the essential reality does not, however, at the same time stand over against and opposed to self-consciousness, as if it were to be found anywhere else; rather it is the essential nature of self-consciousness. Only there has it its existence and its power; and its opposition is the act of self-consciousness itself. For the latter, just in that it is a self to itself, and proceeds to act, lifts itself out of the state of simple immediacy, and itself sets up the division into two. By the act it gives up the specific character of the ethical life, that of being pure and simple certainty of immediate truth, and sets up the division of itself into self as active and reality over against it, and for it, therefore, negative. By the act it thus becomes *Guilt*. For the deed is its doing, and doing is its inmost nature. And the guilt acquires also the meaning of Crime; for as simple ethical consciousness it has turned to and conformed itself to the one law, but turned away from the other and thus violates the latter by its deed.

Guilt is not an external indifferent entity (*Wesen*) with the double meaning, that the deed, as actualiv manifested to the light of day, may be an action of the guilty self, or may not be so, as if with the doing of, it there could be connected something external and accidental that did not belong to it, from which point of view, therefore, the action would be innocent. Rather the act is itself this diremption, this affirming itself for itself, and establishing over against this an. alien external reality. That such a reality exists is due to the deed itself, and is the outcome of it. Hence, innocence is an attribute merely of the want of action (*Nicht-thun*), a state like the mere being of a stone, and one which is not even true of a child.

Looking at the content, however, the ethical act contains the element of wrongdoing, because it does not cancel and transcend the natural allotment of the two laws to the two sexes; but rather, being an undivided attitude towards the law, keeps within the sphere of natural immediacy, and, *qua* acting, turns this one-sidedness into guilt, by merely laying hold of one side

of the essential reality and taking up a negative relation towards the other, i.e. violating it. Where, in the general ethical life, guilt and crime, deeds and actions, come in, will be more definitely brought out later. Meantime, so much is at once clear, that it is not *this* particular individual who acts and becomes guilty. For he, *qua* this particular self, is merely a shadowy unreality; he *is* merely *qua* universal self, and individuality is purely the formal aspect of doing anything at all, while its content is the laws and customs, which, for the individual, are, specifically, the laws and customs of his class or station. He is the substance *qua* genus, which by its determinateness becomes, no doubt, a species, but the specific form remains at the same time the generic universal. Self-consciousness within the life of a nation descends from the universal only down as far as specific particularity, but not as far as the single individuality, which sets up an exclusive self, establishes in its action a reality negative to itself. On the contrary, the action of that self-consciousness rests on secure confidence in the whole, into which there enters nothing alien or foreign, neither fear nor hostility.

Ethical self-consciousness now comes to find in its deed the full explicit meaning of concrete real action as much when it followed divine law as when it followed human. The law manifest to it is, in the essential reality, bound up with its opposite; the essential reality is the unity of both; but the deed has merely carried out one as against the other. But being bound up with this other in the inner reality, the fulfilment of the one calls forth the other, in the shape of something which, having been violated and now become hostile, demands revenge — an attitude which the deed has made it take up. In the case of action, only one phase of the decision is in general in evidence. The decision, however, is inherently something negative, which plants an “other” in opposition to it, something foreign to the decision, which is clear knowledge. Actual reality, therefore, keeps concealed within

itself this other aspect alien to clear knowledge, and does not show itself to consciousness as it fully and truly is (*an und für sich).* In the story of Œdipus the son does not see his own father in the person of the man who has insulted him and whom be strikes to death, nor his mother in the queen whom he makes his wife. In this way a hidden power shunning the light of day, waylays the ethical self-consciousness, a power which bursts forth only after the deed is done, and seizes the doer in the act. For the completed deed is the removal of the opposition between the knowing self and the reality over against it. The ethical consciousness cannot disclaim the crime and its guilt. The deed consists in setting in motion what was unmoved, and in bringing out what in the first instance lay shut up as a mere possibility, and thereby linking on the unconscious to the conscious, the non-existent to the existent. In this truth, therefore, the deed comes to the light; — it is something in which a conscious element is bound up with what is unconscious, what is peculiarly one's own with what is alien and external: — it is an essential reality divided in sunder, whose other aspect consciousness experiences and also finds to be its own aspect, but as a power violated by its doing, and roused to hostility against it.

It may well be that the right, which kept itself in reserve, is not in its peculiar form present to the consciousness of the doer, but is merely implicit, present in the subjective inward guilt of the decision and the action. But the ethical consciousness is more complete, its guilt purer, if it knows beforehand the law and the power which it opposes, if it takes them to be sheer violence and wrong, to be a contingency in the ethical life, and wittingly, like Antigone, commits the crime. The deed when accomplished transforms its point of view; the very performance of it *eo ipso* expresses that what is ethical has to be actual; for the realization of the purpose is the very purpose of acting. Acting expresses precisely the unity of reality and the substance; it expresses the fact that actuality is not an accident for the

essential element, but that, in union with that element, it is given to no right which is not true right. On account of this actuality and on account of its deed ethical consciousness must acknowledge its opposite as its own actuality; it must acknowledge its guilt.

Because of our sufferings we acknowledge we have erred.

To acknowledge this is expressly to indicate that the severance between ethical purpose and actuality has been clone away; it means the return to the ethical frame of mind, which knows that nothing counts but right. Thereby, however, the agent surrenders his character and the reality of his self, and has utterly collapsed. His being lies in belonging to his ethical law, as his substance; in acknowledging the opposite law, however, he has ceased to find his substance in this law; and instead of reality this has become an unreality, a mere *sentiment*, a frame of mind. The substance no doubt appears as the "pathic" element in the individuality, and the individuality appears as the factor which animates the substance, and hence stands above it. But the substance is a "pathic" element which is at the same time his character; the ethical individuality is directly and inherently one with this its universal, exists in it alone, and is incapable of surviving the destruction which this ethical power suffers at the hands of its opposite.

This individuality, however, has all the same the certainty that that individuality, whose "pathic" element is this opposite power [the opposed law], suffers no more harm than it has inflicted. The opposition of the ethical powers to one another, and the process of the individualities setting up these powers in life and action, have reached their true end only in so far as both sides undergo the same destruction. For neither of the powers has any advantage over the other that it should be a more essential moment of the substance common to both. The fact of their being equally and to the same degree essential, and subsisting independently beside each other, means their having no separate self; in the act they have a self-nature, but a

different self — which contradicts the unity of the self and cancels their claim to independent right, and thus brings about their necessary destruction. Character too, in part, looking at its "pathic" element, the substance, belongs to one alone; in part, when we look at the aspect of knowledge, the one character like the other is divided into a conscious element and an unconscious: and since each itself calls forth this opposition, and the want of knowledge is by the act also its doing, each falls into the guilt which consumes it. The victory of one power and its character, and the defeat of the other side, would thus be merely the part and the incomplete work, which steadily advances till the equilibrium between the two is attained. It is in the equal subjection of both sides that absolute right is first accomplished, and the ethical substance, as the negative force devouring both sides, in other words omnipotent and righteous Destiny, makes its appearance.

If both powers are taken according to their specific content and its individualization, we have the scene presented of a contest between them as individuated. On its formal side, this is the struggle of the ethical order and of self-consciousness with unconscious nature and a contingency due to this nature. The latter has a right as against the former, because this is only objective spirit, merely in immediate unity with its substance. On the side of content, the struggle is the rupture of divine and human law. The youth goes forth from the unconscious life of the family and becomes the individuality of the community [i.e. Ruler]. But that he still shares the natural life from which he has torn himself away is seen in the fact that he emerges there — from only to find his claim affected by the contingency that there are *two* brothers who with equal right take possession of the community; the inequality due to the one having been born earlier and the other later, an inequality which is a natural difference, has no importance for them when they enter the ethical life of society. But government, as the single soul, the

self of the national spirit, does not admit of a duality of individuality; and in contrast to the ethical necessity of this unity, nature appears as by accident providing more than one. These two [brothers], therefore, become disunited; and their equal right in regard to the power of the state is destructive to both, for they are equally wrong. Humanly considered, he has committed the crime who, not being in actual possession, attacks the community, at the head of which the other stood. While again he has right on his side who knew how to seize the other merely *qua* particular individual, detached from the community, and who banished him, while thus powerless, out of the community; he has merely laid hands on the individual as such, not the community, not the essential nature of human right. The community, attacked and defended from a point of view which is merely particular, maintains itself; and both brothers find their destruction reciprocally through one another. For individuality, which involves peril to the whole in the maintenance of its own self-existence (*Fürsichseyn*), has thrust its own self out of the community, and is disintegrated in its own nature. The community, however, will do honour to the one who is found on its side; the government, the reestablished singleness of the self of the community, will punish by depriving of the last honour him who already proclaimed its devastation on the walls of the city. He who came to affront the highest spiritual form of conscious life, the spirit of the community, must be stripped of the honour of his entire and complete nature, the honour due to the spirit of the departed.

But if the universal thus lightly knocks off the highest point of its pyramid, and doubtless triumphs victoriously over the family, the rebellious principle of individuation, it has thereby merely put itself into conflict with divine law, the self-conscious with the unconscious spirit. For the latter, this unconscious spirit, is the other essential power, and therefore the power undestroyed, and only insulted by the former. It finds, however, only a

bloodless shade to lend it help towards actually carrying itself out in the face of that masterful and openly enunciated law. Being the law of weakness and of darkness, it therefore gives way, to begin with, before law which has force and publicity; for the strength of the former is effective in the nether realm, not on earth and in the light of day. But the actual and concrete, which has taken away from what is inward its honour and its power, has thereby consumed its own real nature. The spirit which is manifest to the light of day has the roots of its power in the lower world: the certainty felt by a nation, a certainty which is sure of itself and which makes itself assured, finds the truth of its oath binding all its members into one, solely in the mute unconscious substance of all, in the waters of forgetfulness. In consequence, the fulfilment of the public spirit turns round into its opposite, and learns that its supreme right is supreme wrong, its victory rather its own defeat. The slain, whose right is injured, knows, therefore, how to find means of vengeance which are equally as real and strong as the power at whose hands it has suffered. These powers are other communities, whose altars the dogs or birds defiled with the corpse of the dead, which is not raised into unconscious universality by being restored, as is its due, to the ultimate individuum, the elemental earth, but instead has remained above ground in the sphere of reality, and has now received, as the force of divine law, a self-conscious actual universality. They rise up in hostility, and destroy the community which has dishonoured and destroyed its own power, the sacred claims, the "piety" of the family.

Represented in this way, the movement of human and divine law finds the expression of its necessity in individuals, in whom the universal appears as a "pathic" element, and the activity of the movement as action of individuals, which gives the appearance of contingency to the necessity of the process. But individuality and action constitute the principle of individuation in general, a principle which in its pure universality was

called inner divine law. As a moment of the visible community it does not merely exhibit that unconscious activity of the nether world, its operation is not simply external in its existence; it has an equally manifest visible existence and process, actual in the actual nation. Taken in this form, what was represented as a simple process of the "pathic" element as embodied in individuals, assumes another look, and crime and the resulting ruin of the community assume the proper form of their existence.

Human law, then, in its universal mode of existence is the community, in its efficient operation in general is the manhood of the community, in its actual efficient operation is the government. It has its being, its process, and its subsistence by consuming and absorbing into itself the separatist action of the household gods (*Penates*), the individualization into insular independent families which are under the management of womankind, and by keeping them dissolved in the fluent continuum of its own nature. The family at the same time, however, is in general its element, the individual consciousness its universal operative basis. Since the community gets itself subsistence only by breaking in upon family happiness, and dissolving [individual] self-consciousness into the universal, it creates its enemy for itself within its own gates, creates it in what it suppresses, and what is at the same time essential to it — womankind in general. Womankind the everlasting irony in the life of the community changes by intrigue the universal purpose of government into a private end, transforms its universal activity into a work of this or that specific individual, and perverts the universal property of the state into a possession and ornament for the family. Woman in this way turns to ridicule the grave wisdom of maturity, which, being dead to all particular aims, to private pleasure, personal satisfaction, and actual activity as well, thinks of, and is concerned for, merely what is universal; she makes this wisdom the laughing-stock of raw and wanton youth, an object of derision and scorn, unworthy of their

enthusiasm. She asserts that it is everywhere the force of youth that really counts; she upholds this as of primary significance; extols a son as one who is the lord and master of the mother who has borne him; a brother as one in whom the sister finds man on a level with herself; a youth as one through whom the daughter, freed from her dependence (on the family unity), acquires the satisfaction and the dignity of wifehood.

The community, however, can preserve itself only by suppressing this spirit of individualism; and because the latter is an essential element, the community likewise creates it as well, and creates it, too, by taking up the attitude of seeking to suppress it as a hostile principle. Nevertheless, since, by cutting itself off from the universal purpose, this hostile element is merely evil, and in itself of no account, it would be quite ineffective if the community itself did not recognize the force of youth, (manhood, which, while immature, still remains in the condition of particularity), as the force of the whole. For the community, the whole, is a nation, it is itself individuality, and really only is something for itself by other individualities being for it, by its excluding these from itself and knowing itself independent of them. The negative side of the community, suppressing the isolation of individuals within its own bounds, but originating activity directed beyond those bounds, finds the weapons of its warfare in individuals. War is the spirit and form in which the essential moment of ethical substance, the absolute freedom of ethical self-consciousness from all and every kind of existence, is manifestly confirmed and realized. While, on the one hand, war makes the particular spheres of property and personal independence, as well as the personality of the individual himself, feel the force of negation and destruction, on the other hand this engine of negation and destruction stands out as that which preserves the whole in security. The individual who provides pleasure to woman, the brave youth, the suppressed principle of ruin and destruction, comes now into prominence,

and is the factor of primary significance and worth. It is now physical strength and what seems like the chance of fortune, that decide as to the existence of ethical life and spiritual necessity. Because the existence of the ethical life thus rests on physical strength and the chances of fortune, it is *eo ipso* settled that its overthrow has come. While only household gods, in the former case, gave way before and were absorbed in the national spirit, here the living individual embodiments of the national spirit fall by their own individuality and disappear in one universal community, whose bare universality is soulless and dead, and whose living activity is found in the particular individual *qua* particular. The ethical form and embodiment of the life of spirit has passed away, and another mode appears in its place.

This disappearance of the ethical substance, and its transition into another mode are thus determined by the ethical consciousness being directed upon the law essentially in an immediate way. It lies in this character of immediacy that nature at all enters into the acts which constitute the ethical life. Its realization simply reveals the contradiction and the germ of destruction, which lie hid within that very peace and beauty belonging to the gracious harmony and peaceful equilibrium of the ethical spirit. For the essence and meaning of this immediacy contains a contradiction: it is at once the unconscious peace of nature and the self-conscious unresting peace of spirit. On account of this "naturalness", this ethical nation is, in general, an individuality determined by nature, and therefore limited, and thus finds its dissolution in, and gives place to, another individuality. This determinateness being given a positive existence, is a limitation, but at the same time is the negative element in general and the self of individuality. In so far, however, as this determinateness passes away, the life of spirit and this substance, conscious of itself in all its component in duals, are lost. The substance comes forth and stands apart as a formal universality of all the component individuals, and no longer dwells

within them as living spirit; instead, the uniform solidarity of their individuality has burst into a plurality of separate points.

c

The Condition of Right or Legal Status

Translator's comments: A further step in the realization of the principle of coherent sociality is reached when the individual is invested with the universality of the social order by definite enactments of the controlling agency of the social whole. His contingency as an individual is removed by his being expressly treated as a focal unity of the whole order, whose very existence is staked on maintaining him as a emit with a universal significance, and which stands or falls by maintaining him in this condition. The universal order is in this case no longer merely implicit, merely a matter of routine and custom; it is openly and objectively expressed in and through each individual component of society. The form this takes is the differentiation of the social substance into a totality of "persons", each and all invested with express universal, or legally acknowledged, significance. This is the sphere of legal personality, or of individuality constituted by a system of Rights. It is a supreme achievement of social existence, and the highest attainment of coherent social experience. Hence the present section.

This is a condition or stage in every developed community. But the specific historical material for this section is derived from the law — constituted social order of the Roman Empire, especially the Empire under the Antonines. Here, whether by coincidence or otherwise, the culmination of imperial rule and the "golden age" of law synchronized. The triumph of Roman imperial government and the perfecting of the system of Roman jurisprudence were accomplished during the same period of time, about A.D. 131-235. There is every reason to suppose that the two necessarily

arose and fell together, and that the decline and disappearance of the Roman law-constituted state should thus prepare the way for a further achievement of the social spirit of humanity. Hence the historical justification for the transition to the next stage of social life, that of self-discordant spiritual existence.

With this section should be read Hegel's *Philosophy of History,* Part III, especially the introduction to this part, and Sect. III, c. 1., "Rome under the Emperors."

The Condition of Right or Legal Status

THE general comprehensive unity, into which the living immediate unity of individuality and the ethical substance falls back, is the soulless (*geistlos*) community, which has ceased to be the unselfconscious substance of individuals, and in which they now, each in his separate individual existence, count as selves and substances with a being of their own. The universal being thus split up into the atomic units of a sheer plurality of individuals, this inoperative, lifeless spirit is a principle of equality in which all count for as much as each, i.e. have the significance of *Persons.* What in the realm of the ethical life was called the hidden divine law has in fact come out of concealment to the light of actuality. In the former the individual was, and was counted, actual merely as a blood relation, merely as sharing in the general life of the family. *Qua* particular individual, he was the selfless departed spirit; now, however, he has come out of his unreality. Because the ethical substance is only objective, "true", spirit, the individual on that account turns back to the immediate certainty of his own self; he is that substance *qua* positive universal, but his actuality consists in being a negative universal self.

We saw the powers and forms of the ethical world sink in the bare necessity of mere Destiny. This power of the ethical world is the substance turning itself back into its ultimate and simple nature. But that absolute being turning back into itself, that very necessity of characterless Destiny, is nothing else than the Ego of self-consciousness.

This, therefore, is taken henceforth as the absolutely real, as the ultimate self-contained reality. To be so acknowledged is its substantiality; but this is abstract universality, because its content is this rigid self, not the self dissolved in the substance.

Personality, then, has here risen out of the life and activity of the ethical substance. It is the condition in which the independence of consciousness has actual *concrete validity.* The unrealized abstract thought of such independence, which arises through renouncing actuality, was at an earlier stage before our notice in the form of "Stoical self-consciousness". Just as the latter was the outcome of "Lordship and Bondage", the mode in which self-consciousness exists immediately — so personality is the outgrowth of the immediate life of spirit which is the universal controlling will of all, as well as their dutiful obedience and submissive service. What in Stoicism was implicit merely in an abstract way, is now an explicit concrete world. Stoicism is nothing else than the mood of consciousness which reduces to its abstract form the principle of legal status, the principle of the sphere of right — an independence devoid of the qualities of spirit (*geistlos*). By its flight from actuality it attained merely the idea of independence: it is absolutely subjective, exists solely for itself, in that it does not link its being to anything that exists, but is prepared to give up every kind of existence, and places its essential meaning in the unity of mere thinking. In the same manner, the "right" of a "person" is not linked on to a richer or more powerful existence of the individual *qua* individual, nor again connected

with a universal living spirit, but, rather, is attached to the mere unit of its abstract reality, or to that unit *qua* self-consciousness in general.

Now just as the abstract independence of Stoicism set forth the stages of its actualization, so, too, this last form of independence [Personality] will recapitulate the process of the former mode. The former Stoicism] passes over into the state of sceptical confusion, into a broken gibber of negation, which without adopting any permanent form strays from one contingent mode of being and thinking to another, dissipates them indeed in absolute independence, but just as readily creates them again once more. In fact, it is simply the contradiction of consciousness claiming to be at once independent and yet devoid of independence. In like manner, the personal independence characteristic of the sphere of right is really a similar universal confusion and reciprocal dissolution of this kind. For what passes for the absolute essential reality is self-consciousness in the sense of the bare empty unit of the person. As against this empty universality, the substance has the form of what supplies the filling and the content; and this content is now left completely detached and disconnected; for the spirit, which kept it in subjection and held it together in its unity, is no longer present. The empty unit of the person is, therefore, as regards its reality, an accidental existence, a contingent insubstantial process and activity that comes to no durable subsistence. Just as was the case in Scepticism, the formalism of "right" is, thus, by its very conception, without special content; it finds at its hand the fact of "possession," a fact subsisting in multiplicity, and imprints thereon the abstract universality, by which it is called "property" — the same sort of abstraction as Scepticism made use of. But while the reality so determined is in Scepticism called a mere appearance, "mere semblance", and has merely a negative value, in the case of right it has a positive significance. The negative value in the former case consists in the real having the meaning of self *qua* thought, *qua* inherent

universal; the positive significance in the latter case, however, consists in its being mine in the sense of the category, as something whose validity is admitted, recognized, and actual. Both are the same abstract universal, The actual content, the proper value of what is “mine”-whether it be an external possession, or again inner riches or poverty of mind and character-is not contained in this empty form and does not concern it. The content belongs, therefore, to a peculiar specific power, which is something different from the formal universal, is chance and caprice. Consciousness of right, therefore, even in the very process of making its claim good, experiences the loss of its own reality, discovers its complete lack of inherent substantiality; and to describe an individual as a “person” is to use-an expression of contempt.

The free and unchecked power possessed by the content takes determinate shape in this way. The absolute plurality of dispersed atomic personalities is, by the nature of this characteristic feature, gathered at the same time into a single centre, alien to them and just as devoid of the life of spirit (*geistlos*). That central point is, in one respect, like the atomic rigidity of their personality, a merely single reality; but in contrast to their empty singleness, it has the significance of the entire content, and hence is taken to be the essential element; while again, in contrast to their pretended absolute, but inherently insubstantial, reality it is the universal power, and absolute actuality. This “lord and master of the world” takes himself in this way to be the absolute person, comprising at the same time all existence within himself, for whom there exists no higher type of spirit. He is a person: but the solitary single person who has taken his stand confronting all. These all constitute and establish the triumphant universality of the one person; for the single being, as such, is truly what it is only *qua* universal plurality of single units: cut off from this plurality, the solitary and single self is, in fact, a powerless and unreal self. At the same time, it is the consciousness of the

content which is antithetically opposed to that universal personality. This content, however, when liberated from its negative power, means chaos of spiritual powers,, which, when let loose, become elemental independent agencies, break out into wild extravagances and excesses, and fall on one another in mad destruction. Their helpless self-consciousness is the powerless inoperative enclosure and the arena of their chaotic tumult. But this master and lord of the world, aware of his being the sum and substance of all actual powers, is the titanic self-consciousness, which takes itself to be the living God. Since, however, he exists merely *qua* formal self, which is unable to tame and subdue those powers, his procedure and his self-enjoyment are equally titanic excess.

The lord of the world becomes really conscious of what he is — viz. the universal might of actuality — by that power of destruction which he exercises against the contrasted selfhood of his subjects. For his power is not the spiritual union and concord in which the various persons might get to know their own self-consciousness. Rather they exist as persons separately for themselves, and all continuity with others is excluded from the absolute punctual atomicity of their nature. They are, therefore, in a merely negative relation, a relation of exclusion both to one another and to him, who *is* their principle of connexion or continuity. *Qua* this continuity, he is the essential being and content of their formal nature — a content, however, foreign to them, and a being hostile in character, which abolishes just what they take, to be their very essence, viz. bare self-existence without any content, mere empty independent existence each on its own account. And, again, *qua* the continuity of their personality, he destroys this very personality itself. Juridical personality thus finds itself, rather, without any substance of its own, since content alien to it is imposed on it and holds good within it-and does so there, because such content is the reality of that type of personality. On the other hand the passion for destroying and

turning over everything on this unreal field gains for itself the consciousness of its complete supremacy. But this self is sheer devastation, and hence is merely beside itself, and is indeed the very abandonment and rejection of its own self-consciousness.

Such, then, is the constitution of that aspect in which self-consciousness *qua* absolute being is *actual*. The consciousness, however, that is driven back into itself out of this actuality, *thinks* this its insubstantiality, makes it an object of *thought*. Formerly we saw the stoical independence of pure thought pass through Scepticism and find its true issue in the “unhappy consciousness”-the truth about what constitutes its inherent and explicit nature, its final meaning. If this knowledge appeared at that stage merely as the one-sided view of a consciousness *qua* consciousness, here the actual truth of that view has made its appearance. The truth consists in the fact that this universal accepted objectivity of self-consciousness is reality estranged from it. This objectivity is the universal actuality of the self; but this actuality is directly the perversion of the self as well-it is the loss of its essential being. The reality of the self that was not found in the ethical world, has been gained by its reverting into the “person”. What in the case of the former was all harmony and union, comes now on the scene, no doubt in developed form, but self-estranged.

B

Spirit in Self-Estrangement — The Discipline Of Culture

Translator’s comments: The life of spirit as found in the social self-consciousness has two fundamental factors, the universal spirit or social whole as such, and the individual member as such. The interrelation of these constitutes the spiritual existence of society. Each by itself is abstract, but the realization of complete spiritual life through and in each is

absolutely essential for spiritual fulfilment. In the preceding analysis of spirit, one form of this process has been considered, the realization of the objective social order in and through individuals. In the succeeding section, with its various subsections, the other process of securing the same general result is analysed: we have the movement by which, starting from the individual spirit, the realization of complete spiritual existence is established. The former starts from the compact solidarity of the social substance, and results in the establishment of separate and individually complete legal personalities. The latter process starts from the rigidly exclusive unity of the individual self and issues in the establishment of a social order of absolutely universal and therefore absolutely free wins. Both processes are *per se* abstract, necessary though they are: hence, as we shall find, a further stage in the evolution of spirit has still to appear.

The process of spirit in this second stage assumes from the start a conscious contrast between the individual spirit and a universal spiritual whole, a contrast, which, while profound, the individual seeks to remove, because the universality of spiritual existence which he seeks to attain is implicitly involved in his very being as a spiritual entity. His spiritual life seems, to begin with, rent in twain, so complete is the sense of the opposition of these factors constituting his life. His true life, his objective embodiment, seems outside him altogether and yet is felt to be his own self. He seems "estranged" from his complete self, and the estrangement seems his own doing, because the substance from which he is cut off is felt to be his own. The contrast is the deepest that spirit can possibly experience, just because spirit is and knows itself to be self-contained and self-complete, "the only reality". The contrast can only be removed by effort and struggle, for the individual spirit has to create or recreate for itself and by its own activity a universal objective spiritual realm, which it implies and in which alone it can be free and feel itself at home. The struggle spirit goes through

is thus the greatest in the whole range of its experience, for the opposition to be overcome is the profoundest that exists. Since its aim is to achieve the highest for itself, nothing sacred can be allowed to stand in its way. It will make any sacrifice, and, if necessary, produce the direst spiritual disaster, a spiritual "reign of terror", to accomplish its result.

The movement of spirit here analysed covers every form of the individual's "struggle for a substantial spiritual life". It embraces the "intellectual", "economic", "religious", and the "ethical" in the narrower sense of these terms; it embraces all that we mean by "culture" and "civilization". Hence the various parts of the argument: — spiritual "discipline", "enlightenment", the pursuit of "wealth", "belief" and "superstition", "absolute freedom".

The process of spiritual life passed under critical review here is familiar to a greater or less extent in every age and every society. But the actual historical material present to the mind of the writer is derived from the period of European history embracing the entrance of Christianity and Christian philosophy into European civilization after the fall of the Roman Empire, and the intellectual, "humanistic", awakening of the Renaissance which led on to the ecclesiastical revolution known as the Reformation: the rationalistic movement of the eighteenth century, the so-called "Enlightenment" which proceded and culminated in the French Revolution, the supreme outburst of spiritual emancipation known in European history. These two periods, far removed as they are in time, have much in common. They embody principles of spiritual development fundamentally &like, and are therefore freely drawn upon in the analysis, regardless of historicity.

Much of Hegel's analysis of the first stage of this spiritual movement has also directly in view the character of Rameau in Diderot's *Le neveu de Rameau*. This remarkable work was written in 1760, but was first brought to the notice of the literary public by Goethe, who translated and published

the work in 1805. It thus came into Hegel's hands while he was writing the *Phenomenology*: and this perhaps accounts the repeated references to it in the argument. The term "self-estranged spirit" with which he heads this section occurs in Goethe's translation. Rameau is an extreme type of such a spirit.

With this section should be read Hegel's *Philosophy of History*, Pt. III, § 3, c. 2; Pt. IV, § 2, c. 1, § 3, c. 1, 3: the *History of Philosophy*, Pt. 3, Introduction, and c. 2, "The French Philosophy and the German Enlightenment."

Spirit in Self-Estrangement-The Discipline Of Culture

The ethical substance preserved and kept opposition enclosed within its simple conscious life; and this consciousness was in immediate unity with its own essential nature. That nature has therefore the simple characteristic of something merely existing for the consciousness which is directed immediately upon it, and whose "custom" (*Sitte*) it is. Consciousness does not take itself to be particular excluding self, nor does the substance mean for it an existence shut out from it, with which it would have to establish its identity only through estranging itself and thus at the same time have to produce that substance. But that spirit, whose self is absolutely insular, absolutely discrete, finds its content over against itself in the form of a reality that is just as impenetrable as itself, and the world here gets the characteristic of being something external, negative to self-consciousness. Yet this world is a spiritual reality, it is essentially the fusion of individuality with being. This its existence is the work of self-consciousness, but likewise an actuality immediately present and alien to it, which has a peculiar being of its own, and in which it does not know itself. This reality is the external element and the free content of the sphere of

legal right. But this external reality, which the lord of the world of legal right takes control of, is not merely this elementary external entity casually lying before the self; it is his work, but not in a positive sense, rather negatively so. It acquires its existence by self-consciousness of its own accord relinquishing itself and giving up its essentiality, the condition which, in that waste and ruin which prevail in the sphere of right, the external force of the elements let loose seems to bring upon self-consciousness. These elements by themselves are sheer ruin and destruction, and cause their own overthrow. This overthrow, however, this their negative nature, is just the *self;* it is their subject, their action, and their process. Such process and activity again, through which the substance becomes actual, are the estrangement of personality, for the immediate self, i.e. the self without estrangement and holding good as it stands, is without substantial content, and the sport of these raging elements. Its substance is thus just its relinquishment, and the relinquishment is the substance, i.e. the spiritual powers forming themselves into a coherent world and thereby securing their subsistence.

The substance in this way is spirit, self-conscious unity of the self and the essential nature; but both also take each other to mean and to imply alienation. Spirit is consciousness of an objective reality which exists independently on its own account. Over against this consciousness stands, however, that unity of the self with the essential nature, consciousness pure and simple over against actual consciousness. On the one side actual self-consciousness by its self-relinquishment passes over into the real world, and the latter back again into the former. On the other side, however, this very actuality, both person and objectivity, is cancelled and superseded; they are purely universal. This their alienation is pure consciousness, or the essential nature. The “present” has directly its opposite in its “beyond”, which is its thinking and its being thought; just as this again has its opposite in what is

here in the “present”, which is the actuality of the “beyond” but alienated from it.

Spirit in this case, therefore, constructs not merely one world, but a twofold world, divided and self-opposed. The world of the ethical spirit is its own proper present; and hence every power it possesses is found in this unity of the present, and, so far as each separates itself from the other, each is still in equilibrium with the whole. Nothing has the significance of a negative of self-consciousness; even the spirit of the departed is in the life-blood of his relative, is present in the self of the family, and the universal power of government is the will, the self of the nation. Here, however, what is present means merely objective actuality, which has its consciousness in the beyond; each single moment, as an essential entity, receives this, and thereby actuality, from an other, and so far as it is actual, its essential being is something other than its own actuality. Nothing has a spirit self-established and indwelling within it; rather, each is outside itself in what is alien to it. The equilibrium of the whole is not the unity which abides by itself, nor its inwardly secured tranquillity, but rests on the estrangement of its opposite. The whole is, therefore, like each single moment, a self-estranged reality. It breaks up into two spheres: in one kingdom self-consciousness is actually both the self and its object, and in another we have the kingdom of pure consciousness, which, being beyond the former, has no actual present, but exists for Faith, is matter of Belief. Now just as the ethical world passes from the separation of divine and human law, with its various forms, and its consciousness gets away from the division into knowledge and the absence of knowledge, and returns into the principle which is its destiny, into the self which is the power to destroy and negate this opposition, so, too, both these kingdoms of self-alienated spirit will return into the self. But if the former, the first self holding good directly, was the single person, this second, which returns into itself from its self-

relinquishment, will be the universal self, the consciousness grasping the conception; and these spiritual worlds, all of whose moments insist on having a fixed reality and an unspiritual subsistence, will be dissolved in the light of pure Insight. This insight, being the self grasping itself, completes the stage of culture. It takes up nothing but the self, and everything as the self, i.e. it comprehends everything, extinguishes all objectiveness, and converts everything implicit into something explicit, everything which has a being *in itself* into what is *for* itself. When turned against belief, against faith, as the alien realm of inner being lying in the distant beyond, it is Enlightenment (*Aufklärung*). This enlightenment completes spirit's self-estrangement in this realm too, whither spirit in self-alienation turns to seek its safety as to a region where it becomes conscious of the peace of self-equipoise. Enlightenment upsets the household arrangements, which spirit carries out in the house of faith, by bringing in the goods and furnishings belonging to the world of the Here and Now, a world which that spirit cannot refuse to accept as its own property, for its conscious life likewise belongs to that world. In this negative task pure insight realizes itself at the same time, and brings to light its own proper object, the "unknowable absolute Being" and utility. Since in this way actuality has lost all substantiality, and there is nothing more implicit in it, the kingdom of faith, as also that of the real world, is overthrown; and this revolution brings about absolute freedom,, the stage at which the spirit formerly estranged has gone back completely into itself, leaves behind this sphere of culture, and passes over into another region, the land of the inner or subjective moral consciousness (*moralischen Bewusstsein*).

I

The World of Spirit in Self-Estrangement

THE sphere of spirit at this stage breaks up into two regions. The one is the actual world, that of self-estrangement, the other is that which spirit constructs for itself in the ether of pure consciousness raising itself above the first. This second world, being constructed in opposition and contrast to that estrangement, is just on that account not free from it; on the contrary, it is only the other form of that very estrangement, which consists precisely in having a conscious existence in two sorts of worlds, and embraces both. Hence it is not self-consciousness of Absolute Being in and for itself, not Religion, which is here dealt with: it is Belief, Faith, in so far as faith is a flight from the actual world, and thus is not a self-complete experience (*an und für sich*). Such flight from the realm of the present is, therefore, directly in its very nature a dual state of mind. Pure consciousness is the sphere into which spirit rises: but it is not only the element of faith, but of the notion as well. Consequently both appear on the scene together at the same time, and the former comes before us only in antithesis to the latter.

a

Culture and its Realm of Actual Reality

THE spirit of this world is spiritual essence permeated by a self-consciousness which knows itself to be directly present as a self-existent particular, and knows that essence as an objective actuality over against itself. But the existence of this world, as also the actuality of self-consciousness, depends on the process that self-consciousness divests itself of its personality, by so doing creates its world, and treats it as something alien and external, of which it must now take possession. But the renunciation of its self-existence is itself the production of the actuality, and in doing so, therefore, self-consciousness *ipso facto* makes itself master of this world.

To put the matter otherwise, self-consciousness is only something definite, it only has real existence, so far as it alienates itself from itself. By doing so, it puts itself in the position of something universal, and this its universality is its validity, establishes it, and is its actuality. This equality of the self with all selves is, therefore, not the equality that was found in the case of right; self-consciousness does not here, as there, get immediate validity and acknowledgment merely because it is; on the contrary, its claim to be valid rests on its having made itself, by that mediating process of self-alienation, conform to what is universal. The spiritless formal universality which characterizes the sphere of right takes up every natural form of character as well as of existence, and sanctions and establishes them. The universality which holds good here, however, is one that has undergone development, and for that reason it is concrete and actual.

The means, then, whereby an individual gets [objective validity and concrete actuality here is the formative process of Culture. The estrangement on the part of spirit from its natural existence is here the individual's true and original nature, his very substance. The relinquishment of this natural state is, therefore, both his purpose and his mode of existence; it is at the same time the mediating process, the transition of the thought-constituted substance to concrete actuality, as well as, conversely, the transition of determinate individuality to its essential constitution. This individuality moulds itself by culture to what it inherently is, and only by so doing is it then something *per se* and possessed of concrete existence. The extent of its culture is the measure of its reality and its power. Although the self, *qua* this particular self, knows itself here to be real, yet its concrete realization consists solely in cancelling and transcending the natural self. The original determinateness of its nature is, therefore, reduced to a matter of quantity, to a greater or less energy of will, a non-essential principle of distinction. But purpose and content of the self belong to the universal

substance alone, and can only be something universal. The specific particularity of a given nature, which becomes purpose and content, is something powerless and unreal: it is a "kind of being" which exerts itself foolishly and in vain to attain embodiment: it is the contradiction of giving reality to the bare particular, while reality is, *ipso facto,* something universal. If, therefore, individuality is falsely held to consist in particularity of nature and character, then the real world contains no individualities and characters; individuals are all alike for one another; the pretence (*vermeint*) of individuality in that case is precisely the mere presumptive (*gemeint*) existence which has no permanent place in this world where only renunciation of self and, therefore, only universality get actual reality. What is presumed or conjectured to be (*Das Gemeinte*) passes, therefore, simply for what it is, for a *kind* of being. "Kind" is not quite the same as *Espèce*, "the most horrible of all nicknames, for it signifies mediocrity, and denotes the highest degree of contempt". "A kind" and "to be good of its kind" are German expressions, which add an air of honesty to this meaning, as if it were not so badly meant and intended after all; or which, indeed, do not yet involve a clear consciousness of what "kind" and what culture and reality are.

That which, in reference to the single individual, appears as his culture, is the essential moment of spiritual substance as such, viz.: the direct transition of its ideal, thought-constituted, universality into actual reality; or otherwise put, culture is the single soul of this substance, in virtue of which the essentially inherent (*Ansich*) becomes something explicitly acknowledged, and assumes definite objective existence. The process in which an individuality cultivates itself is, therefore, *ipso facto*, the development of individuality *qua* universal objective being; that is to say, it is the development of the actual world. This world, although it has come into being by means of individuality, is in the eyes of self-consciousness

something that is directly and primarily estranged, and, for self-consciousness, takes on the form of a fixed, undisturbed reality. But at the same time self-consciousness is sure this is its own substance, and proceeds to take it under control. This power over its substance it acquires by culture, which, looked at from this aspect, appears as self-consciousness making itself conform to reality, and doing so to the extent permitted by the energy of its original character and talents. What seems here to be the individual's power and force, bringing the substance under it, and thereby doing away with that substance is the same thing as the actualization of the substance. For the power of the individual consists in conforming itself to that substance, i.e. in emptying itself of its own self, and thus establishing itself as the objectively existing substance. Its culture and its own reality are, therefore, the process of making the substance itself actual and concrete.

The self is conscious of being actual only as transcended, as cancelled. The self does not here involve the unity of consciousness of self and object; rather this object is negative as regards the self. By means of the self *qua* inner soul of the process, the substance is so moulded and worked up in its various moments, that one opposite puts life into the other, each opposite, by its alienation from the other, gives the other stability, and similarly gets stability from the other. At the same time, each moment has its own definite nature, in the sense of having an insuperable worth and significance; and has a fixed reality as against the other. The process of thought fixes this distinction in the most general manner possible, by means of the absolute opposition of "good" and "bad", which are poles asunder and can in no way become one and the same. But the very soul of what is thus fixed consists in its immediate transition to its opposite; existence consists really in transmuting each determinate element into its opposite; and it is only this estrangement that constitutes the essential nature and the preservation of the whole. We must now consider this process by which the moments are thus

made actual and give each other life; the alienation will be found to alienate itself, and the whole thereby will take all its contents back into the ultimate principle it implies (*seinen Begriff*).

At the outset we must deal with the simple substance itself in its immediate unconscious organization of its moments; they exist there, but are lifeless, their soul is wanting. We have here something like what we find in nature. Nature, we find, is resolved and spread out into separate and general elements — air, water, fire, earth. Of these air is the unchanging factor, purely universal and transparent; water, the reality that is for ever being resolved and given up; fire, their animating unity which is ever dissolving opposition into unity, as well as breaking up their simple unity into opposite constituents: earth is the tightly compact knot of this articulated whole, the subject in which these realities *are*, where their processes take effect, that which they start from and to which they return. In the same way the inner essential nature, the simple life of spirit that pervades self-conscious reality, is resolved, spread out into similar general areas or masses, spiritual masses in this case, and appears as a whole organized world. In the case of the first mass it is the inherently universal spiritual being, self-identical; in the second it is self-existent being, it has become inherently self-discordant, sacrificing itself, abandoning itself; the third which takes the form of self-consciousness is subject, and possesses in its very nature the fiery force of dissolution. In the first case it is conscious of itself, as immanent and implicit, as existing *per se;* in the second it finds independence, self-existence (*Fürsichseyn*) developed and carried out by means of the sacrifice of what is universal. But spirit itself is the self-containedness and self-completeness of the whole, which splits up into substance *qua* constantly enduring and substance *qua* self-sacrificing, and which at the same time resumes substance again into its own unity; a whole which is at once a flame of fire bursting out and consuming the substance,

as well as the abiding form of the substance consumed. We can see that the areas of spiritual reality here referred to correspond to the Community and the Family in the ethical world, without, however, possessing the native indwelling spirit which the latter have. On the other hand, while destiny is alien to this spirit, here self-consciousness is and knows itself to be the real power underlying them.

We have now to consider these separate members of the whole, in the first instance as regards the way they are presented *qua* thoughts, *qua* essential inherent entities falling within pure consciousness, and also secondly as regards the way they appear as objective realities in concrete conscious life.

In the *first* form, the simplicity of content found in pure consciousness, the first member, being the self-identical, immediate and unchanging nature of every consciousness is the Good: — the independent spiritual power inherent in the essence, alongside which the activity of the mere self-existent consciousness is only by-play. Its other is the passive spiritual being, the universal so far as it parts with its own claims, and lets individuals get in it the consciousness of their particular existence; it is a state of nothingness, a being that is null and void, the Bad. This absolute break-up of the real into these *disjecta membra* is itself a permanent condition; while the first member is the foundation, starting-point, and result of individuals, which are there purely universal, the second member, on the other hand, is a being partly sacrificing itself for another, and, on that very account, is partly their incessant return to self qua individual, and their constant development of a separate being of their own.

But, secondly, these bare ideas of Good and Bad are similarly and immediately alienated from one another; they are actual, and in actual consciousness appear as moments that are objective. In this sense the first state of being is the Power of the State, the second its Resources or Wealth.

The state-power is the simple spiritual substance, as well as the achievement of all, the absolutely accomplished fact, wherein individuals find their essential nature expressed, and where their particular existence is simply and solely a consciousness of their own universality. It is likewise the achievement and simple result from which the sense of its having been their doing has vanished: it stands as the absolute basis of all their action, where all their action securely subsists. This simple ethereal substance of their life, owing to its thus determining their unalterable self-identity, has the nature of objective being, and hence only stands in relation to and exists for "another". It is thus, *ipso facto,* inherently the opposite of itself-Wealth or Resources. Although wealth is something passive, is nothingness, it is likewise a universal spiritual entity, the continuously created result of the labour and action of all, just as it is again dissipated into the enjoyment of all. In enjoyment each individuality no doubt becomes aware of self-existence, aware of itself as single; but this enjoyment is itself the result of universal action, just as, reciprocally, wealth calls forth universal labour, and produces enjoyment for all. The actual has through and through the spiritual significance of being directly universal. Each individual doubtless thinks he is acting in his own interests when getting this enjoyment; for this is the aspect in which he gets the sense of being something on his own account, and for that reason he does not take it to be something spiritual. Yet looked at even in external fashion, it becomes manifest that in his own enjoyment each gives enjoyment to all, in his own labour each works for all as well as for himself, and all for him. His self-existence is, therefore, inherently universal, and self-interest is merely a supposition that cannot get the length of making concrete and actual what it means or supposes, viz. to do something that is not to further the good of all.

Thus, then, in these two spiritual powers self-consciousness finds its own substance, content, and purpose; it has there a direct intuitive consciousness

of its twofold nature; in one it sees what it is inherently in itself, in the other what it is explicitly for itself. At the same time *qua* spirit, it is the negative unity, uniting the subsistence of these powers with the separation of individuality from the universal, or that of reality from the self. Dominion and wealth are, therefore, before the individual as objects he is aware of, i.e. as objects from which he knows himself to be detached and between which he thinks he can choose, or even decline to choose either. In. the form of this detached bare consciousness he stands over against the essential reality as one which is merely there for him. He then has the reality *qua* essential reality within himself. In this bare consciousness the moments of the substance are taken to be not state-power and wealth, but thoughts, the thoughts of Good and Bad. But further, self-consciousness is a relation of his pure consciousness to his actual consciousness, of what is thought to the objective being; it is essentially Judgment. What is Good and what is Bad has already been brought out in the case of the two aspects of actual reality by determining what the aspects immediately are; the Good is state-power, the Bad, wealth. But this first judgment, this first distinction of content, cannot be looked at as a "spiritual" judgment; for in that first judgment the one side has been characterized as only the inherently existing or positive, and the other side as only the explicit self-existent and negative. But *qua* spiritual realities, each permeates both moments, pervades both aspects; and thus their nature is not exhausted in those specific characteristics [positive and negative]. And the self-consciousness that has to do with them is self-complete, is in itself and for itself. It must, therefore, relate itself to each in that twofold form in which they appear; and by so doing, this nature of theirs, which consists in being self-estranged determinations, will come to light.

Now self-consciousness takes that object to be good, and to exist *per se,* in which it finds itself; and that to be bad when it finds the opposite of,

itself there. Goodness means identity of objective reality with it, badness their disparity. At the same time what is for it good and bad, is *per se* good and bad; because it is just that in which these two aspects — of being *per se*, and of being for it — are the same: it is the real indwelling soul of the objective facts, and the judgment is the evidence of its power within them, a power which makes them into what they are in themselves. What they are when spirit is actively related to them, their identity or non-identity with spirit — that is their real nature and the test of their true meaning, and not how they are identical or diverse taken immediately in themselves apart from spirit, i.e. not their inherent being and self-existence *in abstracto.* The active relation of spirit to these moments — which are first put forward as objects to it and thereafter pass by its action into what is essential and inherent — becomes at the same time their reflexion into themselves, in virtue of which they obtain actual spiritual existence, and their spiritual meaning comes to light. But as their first immediate characteristic is distinct from the relation of spirit to them, the third determinate moment — their own proper spirit — is also distinguished from the second moment. Their second inherent nature (*Das zweite Ansich derselben*) — their essentiality which comes to light through the relation of spirit to them — in the first instance, must surely turn out different from the immediate inherent nature; for indeed this mediating process of spiritual activity puts in motion the immediate characteristic, and turns it into something else.

As a result of this process, then, the self-contained conscious mind doubtless finds in the Power of the State its bare and simple reality, and its subsistence; but it does not find its individuality as such; it finds its inherent and essential being, but not what it is for itself. Rather, it finds there action *qua* individual action rejected and denied, and subdued into obedience. The individual thus recoils before this power and turns back into himself; it is for him the reality that suppresses him, and is the bad. For instead of being

identical with him, that with which he is at one, it is something utterly in discordance with individuality. In contrast with this, Wealth is the good; wealth tends to the general enjoyment, it is there simply to be disposed of, and it ensures for every one the consciousness of his particular self. Riches means in its very nature universal beneficence: if it refuses any benefit in a given case and does not gratify every need, this is merely an accident which does not detract from its universal and necessary nature of imparting to every individual his share and being a thousand-handed benefactor.

These two judgments provide the ideas of Goodness and Badness with a content which is the reverse of what they had for us. Self-consciousness had up till now, however, been related to its objects only incompletely, viz. only according to the criterion of the self-existent. But consciousness is also real in its inherent nature, and has likewise to take this aspect for its point of view and criterion, and by so doing round off completely the judgment of self-conscious spirit. According to this aspect state-power expresses its essential nature: the power of the state is in part the quiet insistence of law, in part government and prescription, which appoints and regulates the particular processes of universal action. The one is the simple substance itself, the other its action which animates and sustains itself and all individuals. The individual thus finds therein his ground and nature expressed, organized, and exercised. As against this, the individual, by the enjoyment of wealth, does not get, to know his own universal nature: he only gets a transitory consciousness and enjoyment of himself *qua* particular and self-existing and discovers his discordance, his want of agreement with his own essential nature. The conceptions Good and Bad thus receive here a content the opposite of what they had before.

These two ways of judging find each of them an identity and a disagreement. In the first case consciousness finds the power of the state out of agreement with it, and the enjoyment that came from wealth in accord

with it; while in the second case the reverse holds good. There is a twofold attainment of identity and a twofold form of disagreement: there is an opposite relation established towards both the essential realities. We must pass judgment on these different ways of judging as such; to this end we have to apply the criterion already brought forward. The conscious relation which finds identity or agreement, is, according to this standard, the Good; that which finds want of agreement, the Bad. These two types of relation must henceforth be regarded as diverse forms of conscious existence. Conscious life, through taking up a different kind of relation, thereby becomes itself characterized as different, comes to be itself good or bad. It is not thus distinct in virtue of the fact that it took as its constitutive principle either existence for itself, or mere being in itself; for both are equally essential moments of its life: that dual way of judging, above discussed, presented those principles as separated, and contained, therefore, merely abstract ways of judging. Concrete actual conscious life has within it both principles, and the distinction between its forms falls solely within its own nature, viz. inside the relation of itself to the real.

This relation takes opposite forms; in the one there is an active attitude towards state-power and wealth as to something with which it is in accord, in the other it is related to these realities as to something with which it is at variance. A conscious life which finds itself at one with them has the attribute of Nobility. In the case of the public authority of the state, it regards what is in accord with itself, and sees that it has there its own nature pure and simple and the sphere for the exercise of its own powers, and stands in the position of actually rendering obedient service in its interests, as well as that of inner reverence towards it. In the same way in the sphere of wealth, it sees that wealth secures for it the consciousness of self-existence, of realizing the other essential aspect of its nature: hence it looks upon wealth likewise as something essential in relation to itself,

acknowledges him from whence the enjoyment comes as a benefactor, and. considers itself under a debt of obligation.

The conscious life involved in the other relation, again, that of disagreement, has the attribute of Baseness. It holds to its discordance with both those essential elements. It looks upon the authoritative power of the state as a chain, as something suppressing its separate existence for its own sake, and hence hates the ruler, obeys only with secret malice, and stands ever ready to burst out in rebellion. It sees, too, in wealth, by which it attains to the enjoyment of its own independent existence, merely something discordant, i.e. its disagreement with its permanent nature; since through wealth it only gets a sense of its particular isolated existence and a consciousness of passing enjoyment, since it loves wealth but despises it, and, with the disappearance of enjoyment, of what is inherently evanescent regards its relation to the man of wealth as having ceased too.

These relations now express, in the first instance, a judgment, the determinate characterization of what both those facts [state-power and wealth] are as objects for consciousness; not as yet what they are in their complete objective nature (*an und für sich*). The reflexion which is presented in this judgment is partly at first for *us* [who are philosophizing] an affirmation of the one characteristic along with the other, and hence is a simultaneous cancelling of both; it is not yet the reflexion of them for consciousness itself. Partly, again, they are at first immediate essential entities; they have not become this, nor is there in them consciousness of self: that *for* which they are is not yet their animating principle: they are predicates which are not yet themselves subject. On account of this separation, the entirety of the spiritual process of judgment also breaks asunder and falls into two modes of consciousness, each of which has a one-sided character. Now, just as at the outset the indifference of the two aspects in the process of self-estrangement-one of which was the inherent

essential being of pure consciousness, viz. the determinate ideas of good and bad, the other their actual existence in the form of state-power and wealth-passed to the stage of being related the one to the other, passed to the level of judgment; in the same way this external relation must be raised to the level of their inner unity, must become a relation of thought to actual reality, and also the spirit animating both the forms of judgment will make its appearance. This takes place when judgment passes into inference, becomes the mediating process in which the middle term necessitating and connecting both sides of the judgment is brought into relief.

The noble type of consciousness, then, finds itself in the judgment related to state-power, in the sense that this power is indeed not a self as yet but at first is universal substance, in which, however, this form of mind feels its own essential nature to exist, is conscious of its own purpose and absolute content. By taking up a positive relation to this substance, it assumes a negative attitude towards its own special purposes, its particular content and individual existence, and lets them disappear. This type of mind is the heroism of Service; the virtue which sacrifices individual being to the universal, and thereby brings this into existence; the type of personality which of itself renounces possession and enjoyment, acts for the sake of the prevailing power, and in this way becomes a concrete reality.

Through this process the universal becomes united and bound up with existence in general, just as the individual consciousness makes itself by this renunciation essentially universal. That from which this consciousness estranges itself by submitting to serve is its consciousness immersed in mere existence: but the being alienated from itself is the inherent nature. By thus shaping its life in accord with what is universal, it acquires a Reverence for itself, and gets reverence from others. The power of the state, however, which to start with was merely universal in thought, the inherent nature, becomes through this very process universal in fact, becomes actual

power. It is actually so only in getting that actual obedience which it obtains through self-consciousness judging it to be the essential reality, and through the self being freely sacrificed to it. The result of this action, binding the essential reality and self indissolubly together, is to produce a twofold actuality — a self that is truly actualized, and a state-power whose authority is accepted as true.

Owing to this alienation [implied in the idea of sacrifice] state-power, however, is not yet a self-consciousness that knows itself as state-power. It is merely the law of the state, its inherent principle, that is accepted; the state-power has as yet no particular will. For as yet the self-consciousness rendering service has not surrendered its pure selfhood, and made it an animating influence in the exercise of state-power; the serving attitude merely gives the state its bare being, sacrifices merely its existence to the state, not its essential nature. This type of self-consciousness has a value as one that is in conformity with the essential nature, and is acknowledged and accepted because of its inherent reality. The others find their essential nature operative in it, but not their independent existence — find their thinking, their pure consciousness fulfilled, but not their specific individuality. It has a value, therefore, in their thoughts, and is honoured accordingly. Such a type is the haughty vassal; be is active in the interests of the state-power, so far as the latter is not a personal will [a monarch] but merely an essential will. His self-importance lies only in the honour thus acquired, only in the general mind which directs its thoughts to what is essential, not in an individuality thinking gratefully of services rendered; for he has not helped this individuality [the monarch] to get independence. The language he would use, were he to occupy a direct relation to the personal win of the state-power, which thus far has not arisen, would take the form of "counsel" imparted in the interests of what is best for all.

State-power has, therefore, still at this stage no will to oppose the advice, and does not decide between the different opinions as to what is universally the best. It is not yet governmental control, and on that account is in truth not yet real state-power. Individual self-existence, the possession of an individual will that is not yet *qua* will surrendered, is the inner secretly reserved spiritual principle of the various classes and stations, a spirit which keeps for its own behoof what suits itself best, in spite of its words about the universal best, and tends to make this clap-trap about what is universally the best a substitute for action bringing it about. The sacrifice of existence, which takes place in the case of service, is indeed complete when it goes so far as death. But the endurance of the danger of death which the individual survives, leaves him still a specific kind of existence, and hence a particular self-reference; and this makes the counsel imparted in the interests of the universally best ambiguous and open to suspicion; it really means, in point of fact, retaining the claim to a private opinion of his own, and a separate individual will as against the power of the state. Its relation to the latter is, therefore, still one of discordance; and it possesses the characteristic found in the case of the base type of consciousness — it is ever at the point of breaking out into rebellion.

This contradiction, which has to be overcome, in this form of discordance and opposition between the independence of the individual conscious life and the universality belonging to state-authority, contains at the same time another aspect. That renunciation of existence, when it is complete, as it is in death, is one that does not revert to the consciousness that makes the sacrifice; it simply is: this consciousness does not survive the renunciation and exist in its own self-completeness (*an und für sich*), it merely passes away into the unreconciled opposite. That alone is true sacrifice of individuality, therefore, in which it gives itself up as completely as in the case of death, but all the while preserves itself in the renunciation.

It comes thereby to be actually what it is implicitly — the identical unity of self with its opposed self. In this way, by the inner withdrawn and secret spiritual principle, the self as such, coming forward and abrogating itself, the state-power becomes *ipso facto* raised into a proper self of its own; without this estrangement of self the deeds of honour, the actions of the noble type of consciousness, and the counsels which its insight reveals, would continue to maintain the ambiguous character which, as we saw, kept that secret reserve of private intention and self-will, in spite of its overt pretensions.

This estrangement, however, takes place in Language, in words alone, and language assumes here its peculiar role. Both in the sphere of the general social order (*Sittlichkeit*), where language embodies laws and commands, and in the sphere of actual life, where it appears as conveying advice, the content of what it expresses is the essential reality, and language is the form of that essential content. Here, however, it takes the form in which *qua* language it exists to be its content, and possesses authority, *qua* spoken word; it is the power of utterance *qua* utterance which, just in speaking, performs what has to be performed. For it is the existence of the pure self *qua* self; in speech the self-existent singleness of self-consciousness comes as such into existence, so that its particular individuality is something for others. Ego *qua* this particular pure ego is non-existent otherwise; in every other mode of expression it is absorbed in some concrete actuality, and appears in a shape from which it can withdraw; it turns reflectively back into itself, away from its act, as well as from its physiognomic expression, and leaves such an incomplete existence (in which there is always at once too much as well as too little), lying soulless behind. Speech, however, contains this ego in its purity; it alone expresses I, I itself. Its existence in this case is, *qua* existence, a form of objectivity which has in it its true nature. Ego is this particular ego, but at the same

time universal; its appearing is *ipso facto* and at once the alienation and disappearance of this particular ego, and in consequence its remaining all the while universal. The I, that expresses itself, is apprehended as an ego; it is a kind of infection in virtue of which it establishes at once a unity with those who are aware of it, a spark that kindles a universal consciousness of self. That it is apprehended as a fact by others means *eo ipso* that its existence is itself dying away: this its otherness is taken back into itself; and its existence lies just in this, that, *qua* self-conscious Now, as it exists, it has no subsistence and that it subsists just through its disappearance. This disappearance is, therefore, itself *ipso facto* its continuance; it is its own cognition of itself, and its knowing itself as something that has passed into another self that has been apprehended and is universal.

Spirit acquires this form of reality here, because the extremes, too, whose unity spirit is, have directly the character of being realities each on its own account. Their unity is disintegrated into rigid aspects, each of which is an actual object for the other, and each is excluded from the other. The unity, therefore, appears in the rôle of a mediating term, which is excluded and distinguished from the separated reality of the two sides; it has, therefore, itself the actual character of something objective, apart, and distinguished from its aspects, and objective for them, i.e. the unity is an existent objective fact. The spiritual substance comes as such into existence only when it has been able to take as its aspects those self-consciousnesses, which know this pure self to be a reality possessing immediate validity, and therein immediately know, too, that they are such realities merely through the mediating process of alienation. Through that pure self the moments of substance get the transparency of a self-knowing category, and become clarified so far as to be moments of spirit; through the mediating process spirit comes to exist in spiritual form. Spirit in this way is the mediating term, presupposing those extremes and produced through their existence;

but it is also the spiritual whole breaking out between them, which sunders its self into them, and, solely in virtue of that contact, creates each into the whole in terms of its principle. The fact that both extremes are from the start and in their very nature transcended and disintegrated produces their unity; and this is the process which fuses both together, interchanges their characteristic features, and binds them together, and does so in each extreme. This mediating process consequently actualizes the principle of each of the two extremes, or makes what each is inherently in itself its controlling and moving spirit.

Both extremes, the state-authority and the noble type of consciousness, are disintegrated by this latter. In state-power, the two sides are the abstract universal which is obeyed, and the individual will existing on its own account, which, however, does not yet belong to the universal itself. In nobility, the two sides are the obedience in giving up existence, or the inherent maintenance of self-respect and honour, and, on the other hand, a self which exists purely for its own sake and whose self-existence is not yet done away with, the self-will that remains always in reserve. These two moments into which the extremes are refined, and which, therefore, find expression in language, are the abstract universal, which is called the "universal best", and the pure self which by rendering service abrogated the life of absorption in the manifold variety of existence. Both in principle are the same; for pure self is just the abstract universal, and hence their unity acts as their mediating term. But the self is, at first, actual only in consciousness, the one extreme, while the inherent nature (*Ansich*) is actualized in the other extreme, state-authority. That state-power not merely in the form of honour but in reality should be transferred to it, is lacking in the case of consciousness; while in the case of state-authority there is lacking the obedience rendered to it not merely as a so-called universal best, but as will, in other words, as state-power which is the self regulating and

deciding. The unity of the principle in which state-power still remains, and into which consciousness has been refined, becomes real in this mediating process, and this exists qua mediating term in the simple form of speech. All the same, the aspects of this unity are not yet present in the form of two selves as selves; for state-power has first to be inspired with active selfhood. This language is, therefore, not yet spiritual existence in the sense in which spirit completely knows and expresses itself.

The noble consciousness, being the extreme which is the self, assumes the rôle of producing the language by which the separate factors related are formed into active spiritual wholes. The heroism of dumb service passes into the heroism of flattery. This reflexion of service in express language constitutes the spiritual self-disintegrating mediating term, and reflects back into itself not only its own special extreme, but reflects the extreme of universal power back into this self too, and makes that power, which is at first implicit, into an independent self-existence, and gives it the individualistic form of self-consciousness. Through this process the indwelling spirit of this state-power comes into existence — that of an unlimited monarch. It is unlimited; the language of flattery raises this power into its transparent, purified universality; this moment being the product of language, of purified spiritualized existence, is a purified form of self-identity. It is a monarch; for flattering language likewise puts individualistic self-consciousness on its pinnacle; what the noble consciousness abandons as regards this aspect of pure spiritual unity is the pure essential nature of its thought, its ego itself. More definitely expressed: — flattery raises the individual singleness, which otherwise is only imagined, into its purist form as an actual existence, by giving the monarch his proper name. For it is in the name alone that the distinction of the individual from every one else is not imagined but is actually made by all. By having a name the individual passes for a pure individual not merely in his own consciousness of himself,

but in the consciousness of all. By its name, then, the monarch becomes absolutely detached from every one, exclusive and solitary, and in virtue of it is unique as an atom that cannot communicate any part of its essential nature, and has no equal. This name is thus its reflexion into itself, or is the actual reality which universal power has inherently within itself: through the name the power is the monarch. Conversely he, this particular individual, thereby knows himself, this individual self, to be the universal power, knows that the. nobles not only are ready and prepared for the service of the state-authority, but are grouped as an ornamental setting round the throne, and that they are for ever telling him who sits thereon what he is.

The language of their proffered praise is in this way the spirit that unites together the two extremes in the case of state-power itself. This language turns the abstract power back into itself, and gives to it the moment peculiar to the other extreme, an isolated self of its own, willing and deciding on its own account, and consequently gives it self-conscious existence. Or again, by that means this actual individual self-consciousness comes to be aware of itself for certain as the supreme authority. This power is the central focal self into which, through relinquishing their own inner certainty of self, the many separate centres of selfhood are fused together into one.

Since, however, this proper spirit of state-power subsists by getting its realization and its nourishment from the homage of action and thought rendered by the nobility, it is a form of independence in internal self-estrangement. The noble, the extreme form of self-existence, receives the other extreme of actual universality in return for the universality of thought which he relinquished. The power of the state has passed over to and fallen upon the noble. It falls to the noble primarily to make the state-authority truly effective: in his existence as a self on his own account, that authority

ceases to be the inert being it appeared to be qua extreme of abstract and merely implicit reality.

Looked at *per se,* state-power reflected back into itself, or becoming spiritual, means nothing else than that it has come to be a moment of self-conscious life, i.e. *is* only by being sublated. Consequently it is now the real in the sense of something whose spiritual meaning lies in being sacrificed and squandered; it exists in the sense of wealth. It continues, no doubt, to subsist at the same time as a form of reality over against wealth, into which in principle it is forever passing; but it is a reality, whose inherent principle is this very process of passing over-owing to the service and the reverence rendered to it, and by which it arises — into its opposite, into the condition of relinquishing its power. Thus from its point of view (*Fürsich*) the special and peculiar self, which constitutes its will, becomes, by the self-abasement of the nobility, a universal that renounces itself, becomes completely an isolated particular, a mere accident, which is the prey of every stronger will. What remains to it of the universally acknowledged and incommunicable independence is the empty name.

While, then, the noble consciousness adopted the attitude of something that stood in concord with the universal power, its true nature lies rather in retaining its own independence of being when rendering its service, but, when really and properly abnegating its personality, its true being lies in actually cancelling and rending in pieces the universal substance. Its spirit is the attitude of thoroughgoing discordance: on one side it retains its own will in the honour it receives; on the other hand it gives up its will, but in part it therein alienates from itself its inner nature, and arrives at the extreme of discordance with itself, in part it subdues the universal substance to itself, and puts this entirely at variance with itself. It is obvious that, as a result, its own specific nature, which made it distinct from the so-called base type of mind, disappears, and with that this latter type of mind too. The base type

has gained its end, that of subordinating universal power to self-centred isolation of self.

Endowed in this way by the universal power, self-consciousness exists in the form of universal beneficence: or, from another point of view, universal power is wealth that again is itself an object for consciousness. For wealth is here taken to be the universal put indeed in subjection, but which is not yet absolutely returned into the self through this first transcendence. Self has not as yet its self as such for object, but the universal essential reality ‘m a state of sublation. Since this object has first come into being, the relation of consciousness towards it is immediate, and consciousness has thus not yet set forth its discordance with this object: we have here nobility acquiring its own self-centred existence in the universal that has become non-essential, and hence acknowledging the object and feeling grateful to its benefactor.

Wealth has within it from the first the aspect of self existence (*Fürsichmein*). It is not the self-less universal of state-power, or the unconstrained simplicity of the natural life of spirit; it is state-power as holding its own by effort of will in opposition to a will that wants to get the mastery over it and get enjoyment out of it. But since wealth has merely the form of being essential, this one-sided self-existent life — which has no being in itself, which is rather the sublation of inherent being — is the return of the individual into himself to find no essential reality in his enjoyment. It thus itself needs to be given animation; and its reflective process of bringing this about consists in its becoming something real in itself as well as for itself, instead of being merely for itself; wealth, which is the sublated essential reality, has to become the essentially real. In this way it preserves its own spiritual principle in itself.

It will be sufficient here to describe the *content* of this process since we have already explained at length its form. Nobility, then, stands here in

relation not to the object in the general sense of something essential; what is alien to it is self-existence itself. It finds itself face to face with its own self as such in a state of estrangement, as an objective solid actuality which it has to take from the hands of another self-centred being, another equally fixed and solid entity. Its object is self-existence, i.e. its own being: but by being an object this is at the same time *ipso facts* an alien reality, which is a self-centred being on its own account, has a will of its own; i.e. it sees its self under the power of an alien will on which it depends for the concession of its self.

From every particular aspect self-consciousness can abstract, and for that reason, even when under an obligation to one of these aspects, retains the recognition and inherent validity of self-consciousness as an independent reality. Here, however, it finds that, as regards its own ego, its own proper and peculiar actuality, it is outside itself and belongs to an other, finds its personality as such dependent on the chance personality of another, on the accident of a moment, of an arbitrary caprice, or some other utterly irrelevant circumstance.

In the sphere of legal right, what lies in the power of the objective being appears as an incidental content from which it is possible to make abstraction; and the governing force does not affect the self as such; rather this self is recognized. But here the self sees its self-certainty as such to be the most unreal thing of all, finds its pure personality to be absolutely without the character of personality. The spirit of its gratitude is, therefore, one in which it feels profoundly this condition of humiliation, and feels also the deepest revolt as well. Since the pure ego sees itself outside self, and torn in sunder, everything that has continuity and universality, everything that bears the name of law, good, and right, is thereby torn to pieces at the same time, and goes to rack and ruin: all identity and concord break up, for what holds sway is the purest discord and disunion, what was absolutely

essential is absolutely unessential, what has a being on its own account has its being outside itself: the pure ego itself is absolutely disintegrated.

Thus although this consciousness receives back from the sphere of wealth the objective form of being a separate self-existence, and transcends that objective character, yet it is not only, like the preceding reflexion, not completed in principle, but is consciously unsatisfied: the reflexion, wherein the self receives itself as an objective fact, is sheer direct contradiction that has taken root in the pure ego as such. *Qua* self, however, it at the same time *ipso facto* rises above this contradiction; it is absolutely elastic, and again cancels this sublation of itself, repudiates this repudiation of itself, wherein its self-existence is made to be something alien to it, revolts against this acceptance of itself and in the very reception of itself is self-existent.

Since, then, the attitude of this type of consciousness is bound up with this condition of utter disintegration, the distinction constituting its spiritual nature-that of being nobility and opposed to baseness-falls away and both aspects are the same.

The spirit of well-doing that characterizes the action of wealth may, further, be distinguished from that of the conscious life accepting the benefit it confers, and deserves special consideration.

The spirit animating wealth had an unreal insubstantial independence; wealth was something given freely to all. By communicating what it has, however, it passes into something essential and inherent; since it fulfilled its destiny, that of sacrificing itself, it cancels the aspect of singleness, that of merely seeking enjoyment for one's own self, and, being thus sublated *qua* single, spirit here is universality or essentially real.

What it imparts, what it gives to others, is self-existence. It does not hand itself over, however, as a natural self-less object, as the frankly and freely offered condition of unconscious life, but as self-conscious, as a

reality keeping hold of itself: it is not like the power of an inorganic element which is felt by the consciousness receiving its force to be inherently transitory; it is the power over self, a power aware that it is independent and voluntary, and knowing at the same time that what it dispenses becomes the self of someone else.

Wealth thus shares repudiation with its clientele; but in place of revolt appears arrogance. For in one aspect it knows, as well as the self it benefits, that its self-existence is a matter of accident but itself is this accident in whose power personality is placed. In this mood of arrogance — which thinks it has secured through a dole an alien ego-nature, and thereby brought its inmost being into submission — it overlooks the secret rebellion of the other self: it overlooks the fact of all bonds being completely cast aside, overlooks this pure disintegration, in which, the self-identity of what exists for its own sake having become sheer internal discordance, all oneness and concord, all subsistence is rent asunder, and in which in consequence the repute of and respect for the benefactor are the first to be shattered. It stands directly in front of this abyss, cleaving it to the innermost, this bottomless pit, where every solid base and stay have vanished: and in the depths it sees nothing but a common thing, a plaything for its whims, a chance result of its own caprice. Its spirit consists in quite unreal imagining, in being superficiality forsaken of all true spiritual import.

Just as self-consciousness had its own manner of speech in dealing with state-power, in other words, just as spirit took the form of expressly and actually mediating between these two extremes, self-consciousness has also a mode of speech in dealing with wealth; but still more when in revolt does it adopt a language of its own. The form of utterance which supplies wealth with the sense of its own essential significance, and thereby makes itself master of it, is likewise the language of flattery, but of ignoble flattery; for

what it gives out to be the essential reality, it knows to be a reality without an inherent nature of its own, to be something at the mercy of others. The language of flattery, however, as already remarked, is that of a spirit still one-sided. To be sure its constituent elements are, on the one hand, a self moulded by service into a shape where it is reduced to bare existence, and, on the other, the inherent reality of the power dominating the self. Yet the bare principle, the pure conception, in which the simple self and the inherent reality (*Ansich*), that pure ego and this pure reality or thought, are one and the same thing — this conceptual unity of the two aspects between which the reciprocity takes effect, is not consciously felt when this language is used. The object is consciously still the inherent reality in opposition to the self; in other words, the object is not for consciousness at the same time its own proper self as such.

The language expressing the condition of disintegration, wherein spiritual life is rent asunder, is, however, the perfect form of utterance for this entire realm of spiritual culture and development, of the formative process of moulding self-consciousness (*Bildung*), and is the spirit in which it most truly exists. This self-consciousness, which finds befitting the rebellion that repudiates its own repudiation, is *eo ipso* absolute self-identity in absolute disintegration, the pure activity of mediating pure self-consciousness with itself. It is the oneness expressed in the identical judgment, where one and the same personality is subject as well as predicate. But this identical judgment is at the same time the infinite judgment; for this personality is absolutely split in two, and subject and predicate are entities utterly indifferent one to the other, which have nothing to do with each other, with no necessary unity, so much so that each has the power of an independent personality of its own. What exists as a self on its own account has for its object its own self-existence, which is object in the sense of an absolute other, and et at the same time directly in the form of

itself — itself in the sense of an other, not as if this had an other content, for the content is the same self in the form of an absolute opposite, with an existence completely all its own and indifferent.

We have, then, here the spirit of this real world of formative culture, conscious of its own nature as it truly is, and conscious of its ultimate and essential principle (*Begriff*).

This type of spiritual life is the absolute and universal inversion of reality and thought, their entire estrangement the one from the other; it is pure culture. What is found out in this sphere is that neither the concrete realities, state-power and wealth, nor their determinate conceptions, good and bad, nor the consciousness of good and bad (the consciousness that is noble and the consciousness that is base) possess real truth; it is found that all these moments are inverted and transmuted the one into the other, and each is the opposite of itself.

The universal power, which is the substance, when it gains a spiritual nature peculiarly its own through the principle of individuality, accepts the possession of a self of its own merely as a. name by which it is described, and, even in being actual power, is really so powerless as to have to sacrifice itself. But this self-less reality given over to others, this self that is turned into a thing, is in fact the return of the reality into itself; it is a self-existence that is there for its own sake, it is the existence of spirit.

The principles belonging to these realities, the thoughts of good and bad, are similarly transmuted and reversed in this process; what is characterized as good is bad, and vice versa. The consciousness of each of these moments by itself, the conscious types judged as noble and base — these are rather in their real truth similarly the reverse of what these specific forms intend to be; nobility is base and repudiated, just as what is repudiated as base turns round into the nobleness that characterizes the most highly developed form of free self-consciousness.

Looked at formally, everything is likewise in its external aspects the reverse of what it is internally for itself; and again it is not really and in truth what it is for itself, but something else than it wants to be; its existence on its own account is, strictly speaking, the loss of self, and alienation of self is really self-preservation.

The state of things brought about here, then, is that all moments execute justice on one another all round, each is just as much in a condition of inherent self-alienation as it moulds itself into its opposite, and in this way reverses the nature of that opposite.

Spirit truly objective, however, is just this unity of absolutely separate moments, and in fact comes into existence as the common ground, the mediating agency, just through the independent reality of these self-less extremes. Its existence consists in universal talk and depreciatory judgment rending and tearing everything, before which all those moments are broken up that are meant to signify something real and to stand for actual members of the whole, and which at the same time plays with itself this game of self-dissolution. This judging and talking is, therefore, the real truth, which cannot be got over, while it overpowers everything it is that which in this real world is alone truly of importance. Each part of this world comes to find there its spirit expressed, or gets to be spoken of with *esprit* and finds said of it what it is.

The honest soul takes each moment as a permanent and essential fact, and is the uncultivated thoughtless condition that does not think and does not know that it is likewise doing the very inverse. The distraught and disintegrated soul is, however, aware of inversion; it is, in fact, a consciousness of absolute inversion: the conceptual principle predominates there, brings together into a single unity the thoughts that lie far apart in the case of the honest soul, and the language conveying its meaning is, therefore, full of *esprit* and wit (*geistreich*).

The content uttered by spirit and uttered about itself is, then, the inversion and perversion of all conceptions and realities, a universal deception of itself and of others. The shamelessness manifested in stating this deceit is just on that account the greatest truth. This style of speech is the madness of the musician "who piled and mixed up together some thirty airs, Italian, French, tragic, comic, of all sorts and kinds; now, with a deep bass, he descended to the depths of hell, then, contracting his throat to a high, piping falsetto, he rent the vault of the skies, raving and soothed, haughtily imperious and mockingly jeering by turns". The placid soul that in simple honesty of heart takes the melody of the good and true to consist in harmony of sound and uniformity of tones, i.e. in a single note, regards this style of expression as a "fantastic mixture of wisdom and folly, a *melée* of as much skill as low cunning, composed of ideas as likely to be right as wrong, with as complete a perversion of sentiment, with as much consummate shamefulness in it, as absolute frankness, candour, and truth. It will not be able, to refrain from breaking out into all these tones, and running up and down the whole gamut of feeling, from the depths of contempt and repudiation to the highest pitch of admiration and stirring emotion. A vein of the ridiculous will be diffused through the latter, which takes away from their nature"; the former will find in their very candour a strain of atoning reconcilement, will find in their shuddering depths the all-powerful strain which gives to itself spirit.

If we consider, by way of contrast to the mode of utterance indulged in by this self-transparent distracted type of mind, the language adopted by that simple, placid consciousness of the good and the true, we find that it can only speak in monosyllables when face to face with the frank and self-conscious eloquence of the mind developed under the influence of culture; for it can say nothing to the latter that the latter does not know and say. If it gets beyond speaking in monosyllables, then it says the same thing that the

cultivated mind expresses, but in doing so commits, in addition, the folly of imagining that it is saying something new, something different. Its very syllables, "disgraceful", "base", are this folly already, for the other says. them of itself. This latter type of spirit perverts in its mode of utterance everything that sounds monotonous, because this self-sameness is merely an abstraction, but in its actual reality is intrinsically and inherently perversion. On the other hand, again, the unsophisticated mind takes under its protection the good and the noble (i.e. what retains its identity of meaning in being objectively expressed), and defends it in the only way here possible-that is to say, the good does not lose its value because it may be linked with what is bad or mingled with it, for to be thus associated with badness is its condition and necessity, and the wisdom of nature lies in this fact. Yet this unsophisticated mind, while it intended to contradict, has merely, in doing so, gathered into a trifling form the meaning of what spirit said, and put it in a manner which, by turning the opposite of noble and good into the necessary condition of noble and good, thoughtlessly supposes itself to convey something else than that the so-called noble and good is by its very nature the reverse of itself, or that what is bad is, conversely, something excellent.

If the naïve consciousness makes up for this barren, soulless idea by the concrete reality of what is excellent, by adducing an example of what is excellent, whether in the form of a fictitious case or a true story, and thus shows it to be not an empty name, but an actual fact, then it has against it the universal reality of the perverted action of the entire real world, where that example constitutes merely something quite isolated and particular, merely an *espece*, a *sort* of thing. And to represent the existence of the good and the noble as an isolated particular anecdote, whether fictitious or true, is the bitterest thing that can be said about it.

Finally, should the naïve mind require this entire sphere of perversion to be dissolved and broken up, it cannot ask the individual to withdraw out of it, for even Diogenes in his tub [with his pretence of withdrawal] is under the sway of that perversion; and to ask this of the particular individual is to ask him to do precisely what is taken to be bad, viz. to care for himself as individual. But if the demand to withdraw is directed at the universal individual, it cannot mean that reason must again give up the culture and development of spiritual conscious life which it has reached, that reason should let the extensive riches of its moments sink back into the *naïveté* of natural emotion, and revert and approximate to the wild condition of the animal consciousness, which is also called the natural state of innocence. On the contrary, the demand for this dissolution can only be addressed to the spirit of culture itself, and can only mean that it must *qua* spirit return out of its confusion into itself, and win for itself a still higher level of conscious life.

In point of fact, however, spirit has already accomplished this result. To be conscious of its own distraught and torn condition and to express itself accordingly — this is to pour scornful laughter on existence, on the confusion pervading the whole and on itself as well: it is at the same time this whole confusion dying away and yet apprehending itself to be doing so. This self-apprehending vanity of all reality and of every definite principle reflects the real world into itself in a twofold form: in the particular self of consciousness *qua* particular, and in the pure universality of consciousness, in thought. According to the first aspect, mind thus come to itself has directed its gaze into the world of actual reality, and still has that reality as its own purpose and its immediate content: from the other side, its gaze is in part turned solely on itself and against that world of reality, in part turned away from it towards heaven, and its object is the region beyond the world.

In respect of that return into self the vanity of all things is its own peculiar vanity, it is itself vain. It is self existing for its own sake, a self that knows not only how to sum up and chatter about everything, but cleverly to state the contradiction that lies in the heart of the solid elements of reality, and in the fixed determinations which judgment sets up; and this contradiction is their real truth. Looked at formally it knows everything to be estranged from itself; self-existence is cut off from essential being (*Ansich*), what is intended and the purpose are separated from real truth, and from both again existence for another, what is ostensibly put forward is cut off from the proper meaning, the real fact, the true intention.

It thus knows exactly how to put each moment in antithesis to every other, knows in short how to express correctly the perversion that dominates all of them: it knows better than each what each is, no matter how it is constituted. Since it apprehends what is substantial from the side of that disunion and contradiction of elements combined within its nature, but not from the side of this union itself, it understands very well how to pass judgment on this substantial reality, but has lost the capacity of truly grasping it.

This vanity needs at the same time the vanity of all things, in order to get from them consciousness of itself it therefore itself creates this vanity, and is the soul that supports it. State-power and wealth are the supreme purposes of its strenuous exertion, it is aware that through renunciation and sacrifice it is moulded into universal shape, that it attains universality, and in possessing universality finds general recognition and acceptance: state-power and wealth are the real and actually acknowledged forms of power. But its gaining acceptance thus is itself vain, and just by the fact that it gets the mastery over them it knows them to be not real by themselves, knows rather itself to be the power within them, and them to be vain and empty. That in possessing them it thus itself is able to stand apart from and outside

them — this is what it expresses in witty phrases; and to express this is, therefore, its supreme interest, and the true meaning of the whole process. In such utterance this self-in the form of a pure self not associated with or bound by determinations derived either from reality or thought-comes consciously to be a spiritual entity having a truly universal significance and value. It is the condition in which the nature of all relationships is rent asunder, and it is the conscious rending of them all. But only by self-consciousness being roused to revolt does it know its own peculiar torn and shattered condition; and in its knowing this it has *ipso facto* risen above that condition. In that state of self-conscious vanity all substantial content comes to have a negative significance, which can no longer be taken in a positive sense. The positive object is merely the pure ego itself; and the consciousness that is rent in sunder is inherently and essentially this pure self-identity of self-consciousness returned to itself.

b

Belief and Pure Insight

THE spiritual condition of self-estrangement exists in the sphere of culture as a fact. But since this whole has become estranged from itself, there lies beyond this sphere the nonactual realm of pure consciousness, of thought. Its content consists of what has been reduced purely to thought, its absolute element is thinking. Since, however, thinking is in the first instance the *element* of this world, consciousness *has* merely these thoughts, but it does not as yet *think* them or does not know that they are thoughts: to consciousness they appear in the form of presentations, they are objects in the form of ideas. For it comes out of the sphere of actuality into that of pure consciousness, but is itself still to all intents and purposes in the sphere of actuality with the determinateness that implies. The conscious state of

contrition and abasement is still essentially and inherently the self-identity of pure consciousness, not as a fact that *itself* is aware of but only as presented to us who are considering its condition. It has thus not as yet completed within itself the process of spiritual exaltation, it is simply there; and it still has within itself the opposite principle by which it is conditioned, without as yet having become master of that principle through the mediating process. Hence the essential content of its thought is not taken to be an essential object merely in the form of abstract immanence (*Ansich*), but in the form of a common object, an object that has merely been elevated into another element, without having lost the character of an object that is not constituted by thought.

It is essentially distinct from the immanent nature which constitutes the essential being of the stoic type of consciousness. The significant factor for Stoicism was merely the form of thought as such, which has any content foreign to it that is drawn from actuality. In the case of the consciousness just described, however, it is not the form of thought which counts. Similarly it is essentially distinct from the inherent principle of the virtuous type of conscious life; here the essential fact stands, no doubt, in a relation to reality; it is the essence of reality itself: but it is no more than an unrealized essence of it. In the above type of consciousness the essence, although no doubt beyond reality, stands all the same for an actual real essence. In the same way, the inherently right and good which reason as lawgiver establishes, and the universal operating — when consciousness tests and examines laws — neither of these has the character of actual reality.

Hence while pure thought fell within the sphere of spiritual culture as an aspect of the estrangement characteristic of this sphere, as the standard, in fact, for judging abstract good and abstract bad, it has become enriched, by having gone through the process of the whole, with the element of reality

and thereby with content. This reality of its essential being, however, is at the same time merely a reality of pure consciousness, not of concrete actual consciousness: it is no doubt lifted into the element of thought, but this concrete consciousness does not yet take it for a thought; it is beyond the reality peculiar to this consciousness, for it means flight from the latter.

In the form in which Religion here appears — for it is religion obviously that we are speaking about — as the belief which belongs to the realm of culture, religion does not yet appear as it is truly and completely (*an und für sich*). It has already come before us in other phases, viz. as the unhappy consciousness, as a form of conscious process with no substantial content in it. So, too, in the case of the ethical substance, it appeared as a belief in the nether-world. But a consciousness of the departed spirit is, strictly speaking, not belief, not the inner essence subsisting in the element of pure consciousness away beyond the actual: there the belief its has itself an immediate existence in the present; its element is the family.

But at the stage we are now considering, religion is in part the outcome of the substance, and is the pure consciousness of that substance; in part this pure consciousness is alienated from its concrete actual consciousness, the essence from its existence. It is thus doubtless no longer the insubstantial process of consciousness; but it has still the characteristic of opposition to actuality *qua this* actuality in general, and of opposition to the actuality of self-consciousness in particular. It is essentially, therefore, merely a *belief*.

This pure consciousness of Absolute Being is a consciousness in estrangement. Let us see more closely what is the characteristic of that whose other it is; we can only consider it in connexion with this other. In the first instance this pure consciousness seems to have over against it merely the world of actuality. But since its nature is to flee from this actuality, and thereby is characterized by opposition, it has this actuality inherent within its own being; pure consciousness is, therefore, essentially

in its very being self alienated, and belief constitutes merely one side of it. The other side has already arisen too. For pure consciousness is reflexion out of the world of culture in such a way that the substantial content of this sphere, as also the separate areas into which it falls, are shown to be what they inherently are-essential modes of spiritual life, absolutely restless processes or determinate moments which are at once cancelled in their opposite. Their essential nature bare consciousness, is thus the bare simplicity of absolute distinction, distinction which as it stands is no distinction. Consequently it is pure self-existence not of this single self, but essentially universal self, whose being consists in a restless process invading and pervading the stable existence of actual fact. In it is thus found the certainty that knows itself at once as the truth: there we have pure thought in the sense of absolute notion with all its power of negativity, which annihilates every objective existence that would claim to stand over against consciousness, and turns it into a form of conscious existence.

This pure consciousness is at the same time simple and undifferentiated as well, just because its distinction is no distinction. Being this form of bare and simple reflexion into self, however, it is the element of belief, in which spirit has the character of positive universality, of what is inherent and essential in contrast with that self-existence of self-consciousness.

Forced back upon itself away from this unsubstantial world whose being is mere dissolution, spirit when we consider its true meaning is, in undivided unity, at once the absolute movement, the ceaseless process of negating its appearance, as well as the essential substance thereof satisfied within itself, and the positive stability of that process. But, bearing as they inherently do the characteristic of alienation, these two moments fall apart in the shape of a twofold consciousness. The former is pure Insight, the spiritual process concentrated and focussed in self-consciousness, a process which has over against it the consciousness of something positive, the form

of objectivity or presentation, and which directs itself against this presented object. The proper and peculiar object of this insight is, however, merely pure ego. The bare consciousness of the positive element, of unbroken self-identity, finds its object, on the other hand, in the inner reality as such.

Pure insight has, therefore, in the first instance, no content within it, because it exists for itself by negating everything in it; to belief, on the other hand, belongs the content, but without insight. While the former does not get away from self-consciousness, the latter to be sure has its content as well in the element of pure self-consciousness, but only in thought, not in conceptions — in pure consciousness, not in pure self-consciousness. Belief is, as a fact, in this way pure consciousness of the essential reality, i.e. of the bare and simple inner nature, and is thus *thought* — the primary factor in the nature of belief, which is generally overlooked. The immediateness which characterizes the presence of the essential reality within it is due to the fact that its object is essence, inner nature, i.e. pure thought. This immediateness, however, so far as thinking enters consciousness, or pure consciousness enters into self-consciousness, acquires the significance of an objective being that lies beyond consciousness of self. It is because of the significance which immediacy and simplicity of pure thought thus acquire in consciousness that the essential reality, the object of belief, drops into being an imaginatively presented idea (*Vorstellung*), instead of being the content of thought, and comes to be looked at as a supersensible world, which is essentially an "other" than self-consciousness.

In the case of pure insight, on the other hand, the passage of pure thought into consciousness has the opposite character: objectivity has the significance of a content that is merely negative, that cancels itself and returns into the self; that is to say, only the self is properly object to self, or, to put it otherwise, the object only has truth so far as it has the form of self.

As belief and pure insight fall in common within pure consciousness, they also in common involve the mind's return out of the concrete sphere of spiritual culture. There are three aspects, therefore, from which they show what they are. In one aspect each is outside every relation, and has a being all its own; in another each takes up an attitude towards the concrete actual world standing in antithesis to pure consciousness; while in the third form each is related to the other inside pure consciousness.

In the case of belief the aspect of complete being, of being in-and-for-itself, is its absolute object, whose content and character we have already come to know. For it lies in the very notion of belief that this object is nothing else than the real world lifted into the universality of pure consciousness. The articulation of this world, therefore, constitutes the organization belonging to pure universality also, except that the parts in the latter case do not alienate one another when spiritualized, but are complete realities all by themselves, are spirits returned into themselves and self-contained.

The process of their transition from one into the other is, therefore, only for us [who are analysing the process] an alienation of the characteristic nature in which their distinction lies, and only for us, the observers, does it constitute a necessary series; for belief, however, their distinction is a static diversity, and their movement simply a historical fact.

To deal shortly with the external character of their form: as in the world of culture state-power or the good was primary, so here the first and foremost moment is Absolute Being, spirit absolutely self-contained, so far as it is simple eternal substances. But in the process of realizing its constitutive notion which consists in being spirit, that substance passes over into a form where it exists for an other; its self-identity becomes actual Absolute Being, actualized in self-sacrifice; it becomes a self, but a self that is transitory and passes away. Hence the third stage is the return of self thus

alienated, the substance thus abased, into its first primal simplicity. Only when this is done is spirit presented and manifested as spirit.

These distinct ultimate Realities, when brought back by thought into themselves out of the flux of the actual world, are changeless, eternal spirits, whose being lies in thinking the unity which they constitute. While thus torn away from self-consciousness, these Realities all the same lay hold on it; for if the Ultimate Reality were to be fixed and unmoved in the form of the first bare and simple substance, it would remain alien to self-consciousness. But the laying aside, the "emptying" of this substance, and afterwards its spirit, involves the element of concrete actuality, and thereby participates in the believing self-consciousness, or the believing attitude of consciousness belongs to the real world.

According to this second condition, the believing type of consciousness partly finds its actuality in the real world of culture, and constitutes its spirit and its existence, which have been described; partly, however, belief takes up an attitude of opposition to this its own actuality, looks on this as something vain, and is the process of cancelling and transcending it. This process does not consist in the believing consciousness making witty remarks about the perverted condition of that reality; for it is the naive simple consciousness, which reckons *esprit* and wit as emptiness and vanity, because this still has the real world for its purpose. On the contrary, in opposition to its placid realm of thought stands concrete actuality as a soulless form of existence, which on that account has to be overcome in external fashion. This obedience through service and praise, by cancelling sense-knowledge and action, produces the consciousness of unity with the self-complete and self-existing Being, though not in the sense of an actual perceived unity. This service is merely the incessant process of producing the sense of unity, a process that never completely reaches its goal in the actual present. The religious communion no doubt does so, for it is

universal self-consciousness. But for the individual self-consciousness the realm of pure thought necessarily remains something away beyond its actuality; or, again, since this remote region by the emptying, the "kenosis", of the eternal Being, has entered the sphere of actuality, its actuality is sensuous, uncomprehended. But one sensuous actuality is ever indifferent and external to another, and what lies beyond has thus only received the further character of remoteness in space and time. The essential notion, however — the concrete actuality of spirit directly present to itself — remains for belief an inner principle, which is all and effects all, but never itself comes to the light.

In the case of pure insight, however, the concept, the essential notion (*Begriff*), is alone the real; and this third aspect of belief — that of being an object for pure insight — is the specific relation in which belief here appears. Pure insight itself has like belief to be considered partly by itself (*an und für sich*), partly in relation to the real world — so far as the real world is still present in positive shape, viz. in the form of a vain consciousness — and lastly in that relation to belief just mentioned.

We have already seen what pure insight by itself is. Belief is unperturbed pure consciousness of spirit as the essentially real; pure insight is the self-consciousness of spirit as the essentially real; it knows the essentially real, therefore, not qua essence but *qua* Absolute Self. Its aim thus is to cancel every kind of independence which falls without self-consciousness, whether that be the independence of the actually objective or of the inherently real, and to mould it into conceptual form. It not merely is the certainty of self-conscious reason assured of being all truth; it knows that it is so.

In the form, however, in which the notion of pure insight meets us first, it is not yet realized. As a phase of consciousness it appears in consequence as something contingent, as something isolated and particular, and its inmost constitutive nature appears as some purpose that it has to carry out

and realize. It has to begin with the *intention* of making pure insight universal, i.e. of making everything that is actual into a notion, and one and the same notion for every self-consciousness. The intention is pure, for its content is pure insight; and this insight is similarly pure, for its content is solely the absolute notion, which finds no opposition in an object, and is not restricted in itself. In the unrestricted notion there are found at once both the aspects — that everything objective is to signify only the self-existent, self-consciousness, and that this is to signify something universal, that pure insight is to be the property of all self-consciousnesses. This second feature of the intention is so far a result of culture, in that in culture both the distinctions of objective spirit, the parts, and express determinations of its world, have come to naught, as well as the distinctions which appeared as originally determinate natures. Genius, talent, special capacities one and all, belong to the world of actuality, in so far as this world contains still the aspect of being a herd of self-conscious individuals, where, in confusion and mutual violence, individuals cheat and struggle with one another over the contents of the real world.

The above distinctions doubtless have no place in it as genuine *espèces*. Individuality neither is contented with unreal "fact", nor has special content and purposes of its own. It counts merely as something universally acknowledged and accepted, viz. *qua* cultivated and developed; and the fact of distinction is reduced to a matter of less or more energy, a distinction of quantity, i.e. a non-essential distinction. This last difference, however, has come to nothing, by the fact that the distinction in the state where consciousness was completely torn asunder, turned round into an absolutely qualitative distinction. What is there the other for the ego is merely the ego itself. In this infinite judgment all the one-sidedness and peculiarity of the original self-existing self is extinguished; the self knows itself *qua* pure self

to be its own object; and this absolute identity of both sides is the element of pure insight.

Pure insight, therefore, is the simple ultimate being undifferentiated within itself, and at the same time the universal achievement and result and a universal possession of all. In this simple spiritual substance self-consciousness gives itself and maintains for itself in every object the sense of this its own individual being or of action, just as conversely the individuality of self-consciousness is there identical with itself and universal.

This pure insight is, then, the spirit that calls to every consciousness: be *for* yourselves what you are all essentially *in* yourselves-rational.

ii

Enlightenment

THE peculiar object against which pure insight directs the active force of the notion is belief, this being a form of pure consciousness like itself and yet opposed to it in that element. But at the same time pure insight has a relation to the actual world, for, like belief, it is a return from the actual world into pure consciousness. We have first of all to see bow its activity is constituted as operating against the impure motives and the perverted forms of insight found in the actual world.

We have touched already on the placid type of consciousness, Which stands in contrast to this turmoil of alternate self-dissolution and self-recreation; it constitutes the aspect of pure insight and intention. This unperturbed consciousness, however, as we saw, has no special insight regarding the sphere of culture. The latter has itself rather the most painful feeling, and the truest insight about itself — the feeling that everything made secure crumbles to pieces, that every limb of its existence is wracked

and rent, and every bone broken: moreover, it consciously expresses this feeling in words, pronounces judgment and gives sparkling utterance concerning all aspects of its condition. Pure insight, therefore, can have here no activity and content of its own, and thus can only take up the attitude of formally and truly apprehending this witty insight peculiar to the world and the language it adopts. Since this language is a scattered and broken utterance and the pronouncement a fickle mood of the moment, which is again quickly forgotten, and is only known to be a whole by a third consciousness, this latter can be distinguished as pure insight only if it gathers those several scattered traces into a universal picture, and then makes them the insight of all.

By this simple means pure insight will resolve the confusion of this world. For we have found that the areas and determinate conceptions and individualities are not the essential nature of this actuality, but that it finds its substance and support alone in the spirit which exists *qua* judging and discussing, and that the interest of having a content for this ratiocination and parlaying to deal with alone preserves the whole and the areas of its articulation. In this language which insight adopts, its self-consciousness is still this isolated individual, a self existing for itself; but the emptiness of its content is at the same time emptiness of the self knowing that content to be vain and empty. Now, when the consciousness placidly apprehending all these sparkling utterances of vanity makes a collection of the most striking and penetrating phrases, the soul that still preserves the whole, the vanity of witty criticism, goes to ruin with the other form of vanity, the previous vanity of existence. The collection shows most people a better wit, or at least shows every one a more varied wit than their own, and shows that “knowing-better” and “judging” generally are something universal and are now universally familiar. Thereby the sole and only surviving interest is done away with; and individual light is resolved into universal insight.

Still, however, knowledge of essential reality stands secure above vain and empty knowledge; and pure insight only appears in genuinely active form in so far as it enters into conflict with belief.

a

The Struggle of Enlightenment with Superstition

THE various negative forms which consciousness adopts, the attitude of scepticism, and that of theoretical and practical idealism, are inferior attitudes compared with that of pure insight and the expansion of pure insight-enlightenment; for pure insight is born of the substance of spirit, it knows the pure self of consciousness to be absolute, and enters into conflict with the pure consciousness of the Absolute Being of all reality.

Since belief and insight are the same pure consciousness, but in form are opposed — the reality in the case of belief being a thought, not a notion, and hence something absolutely opposed to self-consciousness, while the reality in the case of pure insight is the self — they are such that *inter se* the one is the absolute negative of the other.

As appearing the one against the other, all content falls to belief; for in its unperturbed element of thought every moment obtains definite subsistence. Pure insight, however, is in the first instance without any content; it is rather the sheer disappearance of content; but by its negative attitude towards what it excludes it will make itself real and give itself a content.

It knows belief to be opposed to insight, opposed to reason and truth. Just as, for it, belief is in general a tissue of superstitious prejudices and errors; so it further sees the consciousness embracing this content organized into a realm of error, in which false insight is the general sphere of consciousness, immediate, naively unperturbed, and inherently unreflective.

Yet all the while this false insight does have within it the moment of self-reflexion, the moment of self-consciousness, separated from its simple *naïveté*, and keeps this reflexion in the background as an insight remaining by itself, and as an evil intention by which that former conscious state is befooled. That mental sphere is the victim of the deception of a Priesthood, which carries out its envious vain conceit of being alone in possession of insight, and carries out its other selfish ends as well. At the same time this priesthood conspires with Despotism, which takes up the attitude of being the synthetic crude (*begrifflos*) unity of the real and this ideal kingdom — a singularly amorphous and inconsistent type of being — and stands above the bad insight of the multitude and the bad intention of the priests, and even combines both of these within itself. As the result of the stupidity and confusion produced amongst the people by the agency of priestly deception, despotism despises both and draws for itself the advantage of undisturbed control and the fulfilment of its lusts, its humours, and its whims. Yet at the same time it is itself in this same state of murky insight, is equally superstition and error.

Enlightenment does not attack these three forms of the enemy without distinction. For since its essential nature is pure insight, which is *per se* universal, its true relation to the other extreme is that in which it is concerned with the common and identical element in both. The aspect of individual existence isolating itself from the universal naïve consciousness is the antithesis of it, and cannot be directly affected by it. The will of the deceiving priesthood and the oppressive despot is, therefore, not primarily the object on which it directs its activity; its object is the insight that is without will and without individualized isolated self-existence, the notion (*Begriff*) of rational self-consciousness, which has its existence in the total conscious area, but is not yet there in the fullness of its true meaning (*Begriff*). Since, however, pure insight rescues this genuinely honest form of

insight, with its naive simplicity of nature, from prejudices and errors, it wrests from the hands of bad intention the effective realization of its powers of deception, for whose realm the incoherent and undeveloped (*begrifflos*) consciousness of the general area provides the basis and raw material, while the self-existence of each power finds its substance in the simple consciousness.

The relation of pure insight to the naive consciousness of absolute Being has now a double aspect. On one side pure insight is inherently one and the same with it. On the other side, however, this naive consciousness lets absolute Being as well as its parts dispose themselves at will in the simple element of its thought, and subsist there, and lets them bold only as its inherent nature and hence hold good in objective form. In accepting this inherent nature it disowns, however, its own independent existence. In so far as, according to the first aspect, this belief is for pure insight inherently and essentially pure self-consciousness, and has merely to become so expressly for itself, pure insight finds in this constitutive notion of belief the element in which, in place of false insight, it realizes itself.

Since, from this point of view, both are essentially the same, and the relation of pure insight takes effect through and in the same element, the communication between them is direct and immediate, and their give and take an unbroken interfusion. Whatever pins and bolts may be otherwise driven into consciousness, it is in itself this simplicity of nature in which everything is resolved, forgotten, and unconstrained, and which, therefore, is absolutely receptive to the activity of the notion. The communication of pure insight is on that account comparable to a silent extension or the expansion, say, of a scent in the unresisting atmosphere. It is a penetrating infection, which did not previously make itself noticeable as something distinct from and opposed to the indifferent medium into which it insinuates its way, and hence cannot be averted. Only when the infection has become

widespread is that consciousness alive to it, which unconcernedly yielded to its influence. For what this consciousness received into itself was doubtless something simple, homogeneous, and uniform throughout it, but was at the same time the simplicity of self-reflected negativity, which later on also develops by its nature into something opposed, and thereby reminds consciousness of its previous state. This simple uniformity is the notion, which is simple knowledge that knows both itself and its opposite, this opposite being, however, cancelled as opposite within the self-knowledge of the notion. In the condition, therefore, in which consciousness becomes aware of pure insight, this insight is already widespread. The struggle with it betrays the fact that the infection has done its work. The struggle is too late; and every means taken merely makes the disease worse; for the disease has seized the very marrow of spiritual life, viz. consciousness in its ultimate principle (*Begriff*), or its pure inmost nature itself. There is therefore no power left in conscious life to surmount the disease. Because it affects the very inmost being, its manifestations, so long as they remain isolated, are repressed and subside and its superficial symptoms are smothered. This is immensely to its advantage; for it does not now squander its power in useless fashion, nor does it show itself unworthy of its true nature — which is the case when it breaks out into symptoms and isolated eruptions antithetic to the content of belief and to the connexion of its external reality. Rather, being now an invisible and unperceived spirit, it insinuates its way through and through the noble parts, and soon has got complete bold over all the vitals and members of the unconscious idol; and then "some fine morning it gives its comrade a shove with the elbow, when, bash! crash! — and the idol is lying on the floor". On some "fine morning", whose noon is not red with blood, if the infection has penetrated to every organ of spiritual life. It is then the memory alone that still preserves the dead form of the spirit's previous state, as a vanished history, vanished men

know not how. And the new serpent of wisdom, raised on high before bending worshippers, has in this manner painlessly sloughed merely a shrivelled skin.

But this silent steady working of the loom of spirit in the inner region of its substance, spirit's own action being hidden from itself, is merely one side of the realizing of pure insight. Its expansion does not only consist in like combining with like; and its realization is not merely an unresisted expansion. The action of the principle of negation is just as essentially a developed process of self-distinction, which, being a conscious action, must set forth its moments in a definitely manifested expression, and must make its appearance in the form of a great noise, and a violent struggle with an opposite as such.

We have, therefore, to see how pure insight and pure intention manifests its negative attitude towards that other which it finds standing opposed to it.

Pure insight and intention, operating negatively, can only be — since its very principle is all essentiality and there is nothing outside it — the negative of itself. As insight, therefore, it passes into the negative of pure insight, it becomes untruth and unreason; and as intention it passes into the negative of pure intention, becomes a lie and sordid impurity of purpose.

It involves itself in this contradiction by the fact that it engages in a strife and thinks to do battle with some alien external other. It merely imagines this, for its nature as absolute negativity lies in having that otherness within its own self. The absolute notion is the category; it is the principle that knowledge and the object of knowledge are the same. In consequence, what pure insight expresses as its other, what it pronounces to be an error or a lie, can be nothing else than its own self; it can only condemn what itself is. What is not rational has no truth, or what is not comprehended through a notion, conceptually determined, is not. When reason thus speaks of some

other than itself is, it in fact speaks merely of itself; it does not therein go beyond itself.

This struggle with the opposite, therefore, combines in its meaning the significance of being insight's own actualization. This consists just in the process of unfolding its moments and taking them back into itself. One part of this process is the making of the distinction in which the insight of reason opposes itself as object to itself; so long as it remains in this condition, it is at variance with itself. *Qua* pure insight it is without any content; the process of its realization consists in itself becoming content to itself; for no other can be made its content, because it is the category become self-conscious. But since this insight in the first instance thinks of the content as in its opposite, and knows the content merely as a content, and does not as yet think of it as its own self, pure insight misconceives itself in it. The complete attainment of insight, therefore, has the sense of a process of coming to know that content as its own, which was to begin with opposite to itself. Its result, however, will be thereby neither the reestablishment of the errors it fights with, nor merely its original notion, but an insight which knows the absolute negation of itself to be its own proper reality to be its self, or an insight which is its self-understanding notion.

This feature of the struggle of enlightenment with errors — that of fighting itself in them, and of condemning that in them which it asserts — this is something for us who observe the process, or is what enlightenment and its struggle are in themselves implicitly. The first aspect of this struggle, however — the contamination and defilement of enlightenment through its pure self-identity accepting the attitude and function of destructive negation — this bow belief looks upon it; belief finds it simply lying unreason and malicious intent, just as enlightenment in the same way regards belief as error and prejudice.

As regards its content, it is in the first instance empty insight, whose content appears an external other to it. It meets this content, consequently, in the shape of something not yet its own, as something that exists quite independent of it, and is found in belief.

Enlightenment, then, conceives its object in the first instance and generally in such a way as to take it as pure insight, and failing to recognize itself there, interprets it as error. In insight as such consciousness apprehends an object in such a manner that it becomes the inner being of conscious life, or becomes an object which consciousness permeates, in which consciousness maintains itself, keeps within itself, and is present to itself, and, by its thus being the process of that object, brings the object into being. It is precisely this which enlightenment rightly declares belief to be, when enlightenment says that the Absolute Reality professed by belief is a being that comes from belief's own consciousness, is its own thought, something produced from and by consciousness. Enlightenment, consequently, explains and declares it to be error, to be a made-up invention about the very same thing as enlightenment itself is.

Enlightenment that seeks to teach belief this new wisdom does not, in doing so, tell it anything new. For the object of belief itself is just this too, viz. a pure essential reality of its own peculiar consciousness; so that this consciousness does not put itself down for lost and negated in that object, but rather puts trust in it; and this just means that it finds itself there as this particular consciousness, finds itself therein to be self-consciousness. If I put my trust in anyone, his certitude of himself is for me the certitude of myself; I know my self-existence in him, I know that he acknowledges it, and that it is for him both his purpose and his real nature. Belief, however, is trust, because the believing consciousness has a direct relation to its object, and thus sees at once that it is one with the object, and in the object.

Further, since what is object for me is something in which I know myself, I am at the same time in that object really in the form of another self-consciousness, i.e. one which has become in that object alienated from its own particular individuation, from its natural and contingent existence, but which partly continues therein to be self-consciousness, and partly is there an essential consciousness just like pure insight.

In the notion of insight there lies not merely this, that consciousness knows itself in the object it looks at, and finds itself directly there, without first quitting the thought element and then returning into itself; the notion implies as well that consciousness is aware of itself as being also the mediating process, aware of itself as active, as the agency of production. Through this it gets the thought of this unity of self as self and object.

Belief also is this very consciousness. Obedience and action make a necessary moment, through which the certainty of existence in Absolute Being comes about. This action of belief does not indeed make it appear as if Absolute Being is itself produced thereby. But the Absolute Being for belief is essentially not the abstract being that lies beyond the believing consciousness; it is the spirit of the religious communion, it is the unity of that abstract being and self-consciousness. The action of the communion is an essential moment in bringing about that it is this spirit of the communion. That spirit is what it is by the productive activity of consciousness, or rather it does not exist without being produced by consciousness. For essential as this process of production is, it is as truly not the only basis of Absolute Being; it is merely a moment. The Absolute Being is at the same time self-complete and self-contained (*an und für sich selbst*).

On the other side the notion of pure insight is seen to be something else than its own object; for just this negative character constitutes the object. Thus from the other side it also expresses the ultimate Being of belief as

something foreign to self-consciousness, something that is not a bone of its bone, but is surreptitiously foisted on it like a changeling child. But here enlightenment is entirely foolish; belief experiences it as a way of speaking which does not know what it is saying, and does not understand the facts of the case when it talks about priestly deception, and deluding the people. It speaks about this as if by means of some hocus-pocus of conjuring priestcraft there were foisted on consciousness as true Reality something that is absolutely foreign, and absolutely alien to it; and yet says all the while that this is an essential reality for consciousness, that consciousness believes in it, trusts in it, and seeks to make it favourably disposed towards itself, i.e. that consciousness therein sees its pure ultimate Being just as much as its own single and universal individuality, and creates by its own action this unity of itself with its essential reality. In other words, it directly declares that to be the very inmost nature of consciousness which it declares to be something alien to consciousness.

How, then, can it possibly speak about deception and delusion? By the fact that it directly expresses about belief the very opposite of what it asserts of belief, it *ipso facto* really reveals itself to belief as the conscious lie. How are deception and delusion to take place, where consciousness in its very truth has directly and immediately the certitude of itself, where it possesses itself in its object, since it just as much finds as produces itself there? The distinction no longer exists, even in words.

When the general question has been raised, whether it is permissible to delude a people, the answer, as a fact, was bound to be that the question is pointless, because it is impossible to deceive a people in this matter. Brass in place of gold, counterfeit instead of genuine coin may doubtless have swindled individuals many a time; lots of people have stuck to it that a battle lost was a battle won; and lies of all sorts about things of sense and particular events have been plausible for a time; but in the knowledge of

that inmost reality where consciousness finds the direct certainty of its own self, the idea of delusion is entirely baseless.

Let us see further how belief undergoes enlightenment in the case of the different moments of its own conscious experience, to which the view just noted referred in the first instance only in a general way. These moments are pure thought, or, *qua* object, absolute Being *per se* (*an und für sich*); then its relation, as a form of knowledge, to absolute Being, the ultimate basis of its belief; and finally its relation to absolute Being in its acts, i.e. its "worship" and service. Just as pure insight has failed to recognize itself in belief as a whole and denied its own nature, we shall find it taking up in these moments, too, an attitude similarly perverted and distorted.

Pure insight assumes towards the absolute Being of the believing mind a negative attitude. This Being is pure thought, and pure thought established within itself as object or as the true Being; in the believing consciousness this immanent and essential reality of thought acquires at the same time for the self-existent consciousness the form of objectivity, but merely the empty form; it exists in the character of something "presented" to consciousness. To pure insight, however, since it is pure consciousness in its aspect of self existing for itself, this other appears as something negative of self-consciousness. This might still be taken either as the pure essential reality of thought, or also as the being found in sense-experience, the object of sense-certainty. But since it is at the same time for the self, and this self, *qua* self which has an object, is an actual consciousness, for insight the peculiar object as such is an ordinary existing thing of sense. This its object appears before it in the picture-presentation found in belief. It condemns this idea and in doing so condemns its own proper object. It really commits a wrong, however, against belief in so apprehending the object of belief as if it were its own object. Accordingly it states regarding belief that its absolute Being is a piece of stone, a block of wood, having eyes and seeing not, or again a bit of bread-dough, which is obtained from grain grown on the field and transformed by men and is returned to earth again; or in

whatever other ways belief may be said to anthropomorphize absolute Being, making it objective and representable.

Enlightenment, proclaiming itself as the pure and true, here turns what is held to be eternal life and holy spirit into a concrete passing thing of sense, and contaminates it with what belongs to sense-certainty — with an aspect inherently worthless and one which is not to be found at all in the worshiping attitude of belief, so that enlightenment simply calumniates it by introducing such an aspect. What belief reveres is for belief assuredly neither stone nor wood, nor bread-dough, nor any other sort of thing of time and sense. If enlightenment thinks it worth while to say its object all the same is this *as well,* or even that it is this in its inherent nature and in truth, then belief also knows that something which it is "as well", but for it this something lies outside; its worship; on the other hand, however, belief does not look on such things as stones, etc., as having an inherent and essential being at all, the essential nature as grasped by pure thought is alone for it something inherently real.

The second moment is the relation of belief as a form of knowing consciousness to this ultimate Being. As pure thinking consciousness belief has this Being immediately before it. But pure consciousness is just as much a mediate relation of conscious certainty to truth, a relation constituting the ground of belief. For enlightenment this ground comes similarly to be regarded as a chance knowledge of chance occurrences. The ground of knowledge, however, is the conscious universal, and in its ultimate meaning is absolute spirit, which in abstract pure consciousness, or thought as such, is merely absolute Being, but *qua* self-consciousness is the knowledge of itself. Pure insight treats this conscious universal, self-knowing spirit pure and simple, likewise as an element negative of self-consciousness. Doubtless this insight is itself pure mediate thought,, i.e. thought mediating itself with itself, it is pure knowledge; but since it is pure

insight, or pure knowledge, which does not yet know itself, i.e. for which as yet there is no awareness that it is this pure process of mediation, this process seems to insight, like everything else constituting it, to be something external, an other. When realizing its inherent principle, then, it develops this moment essential to it; but that moment seems to it to belong to belief, and to be, in its character of an external other, a fortuitous knowledge of stories of “real” events in this ordinary sense of “real”. It thus here charges religious belief with basing its certainty on some particular historical evidences, which, considered as historical evidences, would assuredly not even warrant that degree of certainty about the matter which we get regarding any event mentioned in the newspapers. It further makes the imputation that the certainty in the case of religious belief rests on the accidental fact of the preservation of all this evidence: on the preservation of this evidence partly by means of paper, and partly through the skill and honesty in transferring what is written from one paper to another, and lastly rests upon the accurate interpretation of the sense of dead words and letters. As a matter of fact, however, it never occurs to belief to make its certainty depend on such evidences and such fortuitous circumstances. Belief in its conscious assurance occupies a naïve unsophisticated attitude towards its absolute object, knows it with a purity, which never mixes up letters, paper, or copyists with its consciousness of the Absolute Being, and does not make use of things of that sort to affect its union with the Absolute. On the contrary, this consciousness is the self-mediating, self-relating ground of its knowledge; it is spirit itself which bears witness of itself both in the inner heart of the individual consciousness, as well as through the presence everywhere and in all men of belief in it. If belief wants to appeal to historical evidences in order to get also that kind of foundation, or at least confirmation, for its content which enlightenment speaks of, and is really serious in thinking and acting as if that were an important matter, then it has

eo ipso allowed itself to be corrupted and led astray by the insinuations of enlightenment; the efforts it makes to secure a basis or support in this way are merely indications that show how it has been affected and infected by enlightenment.

There still remains the third aspect, the active relation of consciousness to Absolute Being, its forms of service. This action consists in cancelling the particularity of the individual, or the natural form of its self-existence, whence arises its certainty of being pure self-consciousness, of being, as the result of its action, i.e. as a self-existing conscious individual, one with ultimate Reality.

Since in this action purposiveness and end are distinguished, and pure insight likewise takes up a negative attitude towards this action, and denies itself just as it did in the other moments, it must as regards purposiveness present the appearance of being stupid and unintelligent, since insight united with intention, accordance of end with means, appears to it as an other, as really the opposite of what insight is. As regards the end, however, it has to make badness, enjoyment, and possession, its purpose, and prove itself in consequence to be the impurest kind of intention, since pure intention, qua external, an other, is similarly impure intention.

Accordingly we find that, so far as concerns purposiveness, enlightenment thinks it foolish if the believing individual seeks to obtain the higher consciousness of freedom from entanglement with natural enjoyment and pleasure, by positively denying itself natural enjoyment and pleasure, and proving through its acts that there is no lie in its open contempt for them, but rather that the contempt is quite genuine.

In the same way enlightenment finds it foolish for consciousness to absolve itself of its characteristic of being absolutely individual, excluding all others, and possessing property of its own, by itself demitting its own property, for thereby it shows in reality that this isolation is not really

serious. It shows rather that itself is something that can rise above the natural necessity of isolating itself and of denying, in this absolute isolation of its own individual existence, that e others are one and the same with itself.

Pure insight finds both purposeless as well as wrong. It is purposeless to renounce a pleasure and give away a possession in order to show oneself independent of pleasure and possession; hence, in the converse case, insight will be obliged to proclaim the man a fool, who, in order to eat, employs the expedient of actually eating. Insight again thinks it wrong to deny oneself a meal, and give away butter and eggs not for money, nor money for butter and eggs, but just to give them away and get no return at all; it declares a meal, or the possession of things of that sort, to be an end in itself, and hence in fact declares itself to be a very *impure* intention which ascribes essential value to enjoyment and possessions of this kind. As pure intention it further maintains the necessity of rising above natural existence, above covetousness as to the means for such existence; it only finds it foolish and wrong that this supremacy should be demonstrated by action. In other words this pure intention is in reality a deception, which pretends to and demands an inner elevation, but declares that it is superfluous, foolish, and even wrong to be in earnest in the matter, to put this uplifting into concrete expression, into actual shape and form, and demonstrate its truth.

Pure insight thus denies itself both as pure insight — for it denies directly purposive action, and as pure intention — for it denies the intention of proving its independence of the ends of individual existence.

Thus, then, enlightenment makes belief learn what it means. It takes on this appearance of being bad, because just by the fact of relation to an external other it gives itself a negative reality, it presents itself as the opposite of itself. Pure insight and intention have to adopt this relational attitude, however, for that is their actualization.

This realization appeared, in the first instance, as a negative reality. Perhaps its positive reality is better constituted. Let us see how this stands.

If all prejudice and superstition have been banished, the question arises what next? What is the truth enlightenment has diffused in their stead? It has already given expression to this positive content in its process of exterminating error, for that alienation of itself is equally its positive reality.

In dealing with what for belief is Absolute Spirit, it interprets whatever sort of determination it discovers there as being wood, stone. etc., as particular concrete things of sense. Since in this way it conceives in general every characteristic, i.e. every content and filling, to be a finite fact, to be a human entity and a mental presentation, absolute Being on its view turns out to be a mere vacuum, to which can be attributed no characteristics, no predicates at all. In fact to marry such a vacuity with universal predicates would be essentially reprehensible; and it is just through such a union that the monstrosities of superstition have been produced. Reason, pure insight, is doubtless not empty itself, since the negative of itself is present consciously to it, and is its content; it is, on the contrary, rich in substance, but only in particularity and restrictions. The enlightened function of reason, of pure insight, consists in allowing nothing of that sort to appertain to Absolute Being, nor attributing anything of that kind to it: this function well knows how to put itself and the wealth of finitude in their place, and deal with the Absolute in a worthy manner.

In contrast with this colourless empty Being there stands, as a second aspect of the positive truth of enlightenment, the singleness in general of conscious life and of all that it is: — a singleness excluded from an absolute Being, and standing by itself as something entirely self-contained. Consciousness, which in its very earliest expression is sense-certainty and mere "opining", here comes back, after the whole course of its experience, to this same point, and is once again a *knowledge,* of what is purely

negative of itself, a knowledge of sense things, i.e. of existent entities which stand in indifference over against its own self-existence. But here it is not an *immediate* natural consciousness; it has *become* such for itself. While at first the prey to every sort of entanglement, into which it is plunged by its gradually unfolding, and now led back to its first form by pure insight, it has arrived at this first state as the result and outcome of the process. This sense-certainty, resting as it does on an insight into the nothingness of all other forms of consciousness, and hence the nothingness of whatever is beyond sense-experience — this sense-certainty is no longer a mere opining", it is rather absolute truth. This nothingness of everything that transcends sense is doubtless merely a negative proof of this truth. But no other is admissible or possible, for the positive truth of sense-experience in itself is just the unmediated self-existence of the notion itself *qua* object and an object in the form of otherness — the positive truth is that it is absolutely certain to every consciousness that it is and that there are other real things outside it, and that in its natural existence it, as well as these things too, are in and for themselves or absolute.

Lastly, the third moment of the truth of enlightenment is the relation of the particular beings to Absolute Being, is the relation of the first two moments to one another. Insight, *qua* pure insight of what is identical or unrestricted, also transcends the unlike or diverse, i.e. transcends finite reality, or transcends itself qua mere otherness. The "beyond" of this otherness it takes to be the void, to which it therefore relates the facts of sense. In determining this relation both the terms do not enter the relation as its content; for the one is the void, and thus a content is only to be had through the other, through sense reality. The form the relation assumes, however, to the determination of which the aspect of immanent and ultimate being (*Ansich*) contributes, can be shaped just as we please; for the form is something inherently and essentially negative, and therefore something self-

opposed, being as well as nothing, inherent and ultimate (*Ansich*) as well as the opposite; or, what is the same thing, the relation of actuality to an inherent essential being *qua* something beyond, is as much a negating as a positing of that actuality. Finite actualities can, therefore, properly speaking, be taken just in the way people have need of them. Sense facts are thus related now positively to the Absolute *qua* something ultimate (*Ansich*), and sense reality is itself ultimate *per se;* the Absolute makes them, fosters and cherishes them. Then, again, they are related to it as an opposite, that is to their own non-being; in this case they are not something ultimate, they have being only for an other. Whereas in the preceding mode of consciousness the conceptions involved in the opposition took shape as good and bad, in the case of pure insight they pass into the more abstract forms of what is *per se* (*Ansich*) and what is for an other.

Both ways of dealing with the positive as well as the negative relation of finitude to what is *per se* (*Ansich*) are, however, equally necessary as a matter of fact, and everything is thus as much something *per se,* (*an sich*) as it is something for an other: in other words everything is “useful”.

Everything is now at the mercy of other things, lets itself now be used by others, and exists for them; and then again it, so to say, gets up on its hind legs, fights shy of the other, exists for itself on its own account., and on its side uses the other too.

From this, as a result, man, being the thing *conscious* of this relation, derives his true nature and place. As he is immediately, man is good, *qua* natural consciousness *per se,* absolute *qua* individual, and all else exists for him: and further — since the moments have the significance of universality for him *qua* self-conscious animal,-everything exists to pleasure and delight him, and, as he first comes from the hand of God, he walks the earth as in a garden planted for him. He is bound also to have plucked the fruit of the tree of knowledge of good and evil; he claims to have, a use for it which

distinguishes him from every other being, for, as it happens, his inherently good nature is also so constituted that the superfluity of delight does it harm, or rather his singleness contains as a factor in its constitution a principle that goes beyond it; his singleness can overreach itself and destroy itself. To prevent this, he finds reason a useful means for duly restraining this self-transcendence, or rather for preserving himself when he does go beyond the determinate: for such is the force of consciousness. The enjoyment of this conscious and essentially universal being must, in manifold variety and duration, be itself universal and not something determinate. The principle of measure or proportion has, therefore, the determinate function of preventing pleasure in its variety and duration from being quite broken off: i.e. the function of “measure” is immoderation.

As everything is useful for man, man is likewise useful too, and his characteristic function consists in making himself a member of the human herd, of use for the common good, and serviceable to all. The extent to which he looks after his own interests is the measure with which he must also serve the purpose of others, and so far as he serves their turn, be is taking care of himself: the one hand washes the other. But wherever he finds himself there he is in his right place: he makes use of others and is himself made use of.

Different things are serviceable to one another in different ways. All things, however, have this reciprocity of utility by their very nature, by being related to the Absolute in the twofold manner, the one positive, whereby they have a being all their own, the other negative, and thereby exist for others. The relation to Absolute Being, or Religion, is therefore of all forms of profitableness the most supremely profitable; for it is profiting pure and simple; it is that by which all things stand-by which they have a being all their own-and that by which all things fall — have an existence for something else.

Belief, of course, finds this positive outcome of enlightenment as much an abomination as its negative attitude towards belief. This enlightened insight into absolute Being, that sees nothing in it but just absolute Being, the *être suprême,* the great Void — this intention to find that everything in its immediate existence is inherently real (*an sich*) or good, and finally to find the relation of the individual conscious entity to the Absolute Being, Religion, exhaustively summed up in the conception of profitableness — all this is for belief utterly and simply revolting. This special and peculiar wisdom of enlightenment necessarily seems at the same time to the believing mind to be sheer insipidity and the confession of insipidity; because it consists in knowing nothing of absolute Being, or, what amounts to the same thing, in knowing this entirely accurate platitude regarding it — that it is merely absolute Being, and, again, in knowing nothing but finitude, taking this, moreover, to be the truth, and thinking this knowledge about finitude as the truth to be the highest knowledge attainable.

Belief has a divine right as against enlightenment, the right of absolute self-identity or of pure thought; and it finds itself utterly wronged by enlightenment; for enlightenment distorts all its moments, and makes them something quite different from what they are in it. Enlightenment, on the other hand, has merely a human right as against belief, and can only put in a human claim for its own truth; for the wrong it commits is the right of disunion, of discordance, and consists in perverting and altering, a right that belongs to the nature of self-consciousness in opposition to the simple ultimate essence or thought. But since the right of enlightenment is the right of self-consciousness, it will not merely retain its own right, too, in such a way that two equally valid rights of spirit would be left standing in opposition to one another without either satisfying the claims of the other; it will maintain the absolute right, because self-consciousness is the negative function of the notion (*Begriff*), a function which does not merely operate in

independence, but also gets control over its opposite. And because belief is a mode of consciousness, it will not be able to baulk enlightenment of that right.

For enlightenment does not operate against the believing mind with special principles of its own, but with those which belief itself implies and contains. Enlightenment merely brings together and presents to belief its own thoughts, the thoughts that lie scattered and apart within belief, all unknown to it. Enlightenment merely reminds belief, when one of its own forms is present, of others it also has, but which it is always forgetting when the one is there. Enlightenment shows itself to belief to be pure insight, by the fact that it, in a given determinate moment, sees the whole, brings forward the opposite element standing in direct relation to that moment and, converting the one in the other, brings out the negative principle which is the essence of both thoughts — the notion. It appears, therefore, to belief to be distortion and lies, because it shows up the other side in the moments of belief. Enlightenment seems, in consequence, directly to make something else out of them than they are in their own singleness; but this other is equally essential, and in reality is to be found in the believing mind itself, only the latter does not think about it, but keeps it somewhere else. Hence neither is it foreign to belief nor can it be denied of belief.

Enlightenment itself, however, which reminds belief of the opposite of its various separate moments, is just as little enlightened regarding its own nature. It takes up a purely negative attitude to belief, so far as it excludes its own content from its own pure activity and takes that content to be negative of itself. Consequently, neither in this negative, in the content of belief, does it recognize itself, nor, for this reason, does it bring together the two thoughts, the one which it contributes and the one against which it brings the first. Since it does not recognize that what it condemns in the case of belief is directly its very own thought, it has its own being in the

opposition of both moments, only one of which — viz. in every case the one opposed to belief — it acknowledges, but cuts off the other from the first, just as belief does. Enlightenment, consequently, does not produce the unity of both as their unity, i.e. the notion; but the notion *arises* before it and comes to light of its own accord, in other words, enlightenment finds the notion merely as something there at hand. For in itself the proms of realizing pure insight is just this, that insight, whose essential nature is the notion, first comes to be for itself in the shape of an absolute other, and repudiates itself (for the opposite of the notion is an absolute opposite), and then out of this otherness comes to itself or comes to its notion.

Enlightenment, however, is merely this process, it is the activity of the notion in still unconscious form, an activity which no doubt arrives at itself *qua* object, but takes this object for an external other, and does not even know the nature of the notion, i.e. does not know that it is the undifferentiated, the self-identical, which absolutely divides itself.

As against belief, then, insight is the power of the notion in so far as this is the active process of relating the moments lying apart from one another in belief; a way of relating them in which the contradiction in them comes to light. Herein lies the absolute right of the power which insight exercises over belief; but the actuality on which it brings this power to bear lies just in the fact that the believing consciousness is itself the notion and thus itself recognizes and accepts the opposite which insight presents before it. Insight, therefore, has and retains right against belief, because it makes valid in belief what is necessary to belief itself, and what belief contains within it.

At first enlightenment emphasizes the moment that the notion is an act of consciousness; it maintains in the face of belief that the absolute Being belief accepts is a Being of the believer's consciousness *qua* a self, or that this absolute Being is produced by consciousness. To the believing mind its

absolute Being, while it is in itself objective for the believer, is also and at the same time not like a foreign thing standing therein, having come there no one knows bow or whence. The trust of belief consists just in finding itself as a particular personal consciousness in absolute Being, and its obedience and service consist in producing, through its activity, that Being as *its own* Absolute. Enlightenment, strictly speaking, only reminds belief of this, if belief affirms without qualification the ultimate nature (*Ansich*) of absolute Being to be something beyond the action of consciousness.

But while enlightenment no doubt puts alongside the one-sidedness of belief the opposite moment, viz.: — the action of belief in contrast to being — and being is all belief thinks about here — and yet does not itself in doing so bring those opposite thoughts together, enlightenment isolates the pure moment of action, and declares that what belief takes to be *per se* ultimate (*Ansich*) is merely a product of consciousness. Isolated action, action opposed to this ultimate Being (*Ansich*), is, however, a contingent action, and, *qua* presentative activity, is a creating of fictions — presented figurative ideas that have no being in themselves. And this is how enlightenment regards the content of belief.

Conversely, however, pure insight equally says the very opposite. When insight lays stress on the moment of otherness which the notion involves it declares the essential Reality for belief to be one which does not in any way concern consciousness, is away beyond consciousness, foreign to it, and unknown. To belief, too, that Reality has the same character. On one side belief trusts in it, and gets, in doing so, the assurance of its own self, on the other side it is unsearchable in all its ways and. unattainable in its being.

Further, enlightenment maintains against the believing mind a right which the latter concedes, when enlightenment treats the object of the believer’s veneration as stone and wood, or, in short, some finite anthropomorphic feature. For, since this consciousness is divided within

itself in having a “beyond” remote from actuality and an immediate present embodiment of that remote beyond, there is also found in it, as a matter of fact, the view that sense-things have a value and significance in and for themselves (*an und für sich*). But belief does not bring together these two ideas of what is “in and for itself”, viz. that at one time what is “in and for itself” is for belief pure essential Reality and at another time is an ordinary thing of sense. Even its own pure consciousness is affected by this last view; for the distinctions of its supersensuous world, because this is without the notion, are a series of independent shapes and forms, and their activity is a happening, i.e. they exist merely in figurative presentation, and have the characteristic of sense-existence.

Enlightenment on its side isolates actuality in the same way, treating it as a reality abandoned by spirit; isolates specific determinateness and makes it a fixed finite element, as if it were not a moment in the spiritual process of the real itself, a something which is not nothing, nor possessed of a being all its own, but evanescent and transitory.

It is clear that the same is the case with regard to the ground of knowledge. The believing mind itself recognizes an accidental knowledge; for in belief the mind adopts an attitude towards contingencies, and absolute Being itself comes before belief in the form of a pictorial presentation of an ordinary actual fact. Consequently belief is *also* a certainty which does not carry the truth within it, and it confesses itself to be an unsubstantial consciousness of this kind, holding of *this* world and separated from the spirit that is self-assuring and assured of itself. This moment, however, belief forgets in its immediate spiritual knowledge of absolute Reality.

Enlightenment, however, which reminds belief of all this, thinks again merely of the contingency of the knowledge and forgets the other — thinks only of the mediating process which takes effect through an alien third term, and does not think of that process wherein the immediate is for itself its

own third term through which it mediates itself with the other, viz. with itself.

Finally, on the view enlightenment takes of the action of belief, the rejection of enjoyment and possessions is looked upon as wrong and purposeless.

As to the wrong thus done, enlightenment preserves its harmony with the believing mind in this: — that belief itself acknowledges the actual reality of possessing property, keeping bold of it, and enjoying it. In insisting on its property, it behaves with all the more stubborn independence and exclusiveness, and in its enjoyment with all the more frank self-abandonment, since its religious act of giving up pleasure and property takes effect beyond the region of this actuality, and purchases for it freedom to do as it likes so far as that other sphere is concerned. This service, the service of sacrificing natural activities and enjoyments, in point of fact has no truth, owing to this opposition. The retention and the sacrifice subsist together side by side. The sacrifice is merely a "sign" which performs real sacrifice only as regards a small part, and hence in point of fact is only a figurative idea of sacrifice.

As for purposiveness, enlightenment finds it pointless and stupid to throw away a possession in order to feel and to prove oneself to be free from all possession, to renounce *an* enjoyment in order to think and demonstrate that one is rid of all enjoyment. The believing mind itself takes the absolute act for a universal one. Not only does the action of its absolute Reality as its object appear something universal, but the individual consciousness, too, has to prove itself detached entirely and altogether from its sensuous nature. But throwing away a single possession, giving up and disclaiming a single enjoyment, is not acting universally in this way. And since in the action the purpose, which is a universal, and the performance, which is a singular process, were bound to stand before consciousness, as

essentially incompatible, that action shows itself to be of a kind in which consciousness has no share, and consequently this way of acting is seen to be too naive to be an action at all. It is too naive to fast in order to prove oneself quite indifferent to the pleasures of the table; too naive to rid the body of some other pleasure, as Origen did, in order to show that pleasure is finished and done with. The act itself proves an external and a single operation. But desire is deeply rooted within the inner life, and is a universal element; its pleasure neither disappears with the instrument for getting pleasure nor by abstention from particular pleasures.

But enlightenment on its side here isolates the unrealized inwardness as against the concrete actuality; just as in the case of the devotion and direct intuition of belief, enlightenment held fast to the externality of things of sense as against the inward attitude of belief. Enlightenment finds the main point in the intention, in the thought, and thereby finds no need for actually bringing about the liberation from natural ends. On the contrary, this inner sphere is itself the formal element that has its concrete fulfilment in natural impulses, which are justified simply by the fact that they fall within, that they belong to universal being, to nature.

Enlightenment, then, holds irresistible sway over belief by the fact that the latter finds in its own consciousness the very moments to which enlightenment gives significance and validity. Looking more closely at the action exerted by this force, its operation on belief seems to rend asunder the beautiful unity of trustfulness and immediate confidence, to pollute its spiritual life with lower thoughts drawn from the sphere of sense, to destroy the feeling of calm security in its

attitude of submission by introducing the vanity of understanding, of self-will, and self-fulfilment. But in point of fact, enlightenment really brings to pass the abolition of that state of unthinking, or rather unreflective (*begrifflos*) cleavage, which finds a place in the nature of belief. The

believing mood weighs and measures by a twofold standard, it has two sorts of eyes and ears, uses two voices to express its meaning, it duplicates all ideas, without comparing and relating the sense and meaning in the two forms used. Or we may say belief lives its life amidst two sorts of perceptions, the one the perceptions of thought which is asleep, purely uncritical and uncomprehending, the other those of waking consciousness living solely and simply in the world of sense; and in each of them it manages to conduct a household of its own.

Enlightenment illuminates that world of heaven with ideas drawn from the world of sense, pointing out there this element of finitude which belief cannot deny or repudiate, because it is self-consciousness, and in being so is the unity to which both kinds of ideas belong, and in which they do not fall apart from one another; for they belong to the same indivisible simple self into which belief has passed, and which constitutes its life.

Belief has by this means lost the content which furnished its filling, and collapses into an inarticulate state where the spirit works and weaves within itself. Belief is banished from its own kingdom; this kingdom is sacked and plundered, since the waking consciousness has forcibly taken to itself every distinction and expansion of it and claimed every one of its parts for earth, and returned them to the earth that owns them. Yet belief is not on that account satisfied, for this illumination has everywhere brought to light only what is individual, with the result that only insubstantial realities and finitude forsaken of spirit make any appeal to spirit.

Since belief is without content and cannot continue in this barren condition, or since, in getting beyond finitude, which is the sole content, it finds merely the empty void, it is a sheer longing: its truth is an empty beyond, for which there is no longer any appropriate content to be found, for everything is appropriated and applied in other ways.

Belief in this manner has in fact become the same as enlightenment-the conscious attitude of relating finite that inherently exists to an unknown and unknowable Absolute without predicates; the difference is merely that the one is enlightenment satisfied, while belief is enlightenment unsatisfied. It win yet be seen whether enlightenment can continue in its state of satisfaction; that longing of the troubled, beshadowed spirit, mourning over the loss of its spiritual world, lies in the background. Enlightenment has on it this stain of unsatisfied longing: — in its empty Absolute Being we find this in the form of the pure abstract object; in passing beyond its individual nature to an unfulfilled beyond, the stain appears as an act and a process; in the selflessness of what is "useful" it is seen in the form of a sensuous concrete object. Enlightenment will remove this stain: by considering more closely the positive result which constitutes the truth for it, we shall find that the stain is implicitly removed already.

b

The Truth of Enlightenment

THE spirit that sullenly works and weaves without further distinctions within itself has thus passed into itself away beyond consciousness, which, on the other hand, has arrived at clearness as to itself. The first moment of this clearness of mind is determined, in regard to its necessity and condition, by the fact that pure insight, or insight that is implicitly and *per se* notion, actualizes itself; it does so when it gives otherness or determinateness a place in its own nature. In this manner it is negative pure insight, i.e. the negation of the notion; this negation is equally pure; and herewith has arisen the pure and simple "thing", the Absolute Being, that has no further determination of any sort. If we define this more precisely, insight in the sense of absolute notion is a distinguishing of distinctions that

are not so any longer, of abstractions or pure notions that no longer support themselves but find a fixed hold and a distinction only by means of the whole life of the process. This distinguishing of what is not distinguished consists just in the fact that the absolute notion makes itself its object, and as against that process asserts itself to be the essence. The essence hereby is without the aspect wherein abstractions or distinctions are kept apart, and hence becomes pure thought in the sense of a pure thing.

This, then, is just the dull, silent, unconscious working and weaving of the spirit at the loom of its own being, to which belief, as we saw, sank back when it lost all distinction in its content. And this is at the same time that movement of pure self-consciousness, in regard to which the essence is intended to be the absolutely external beyond. For, because this pure self-consciousness is a movement working in pure notions, in distinctions that are no distinctions, pure self-consciousness collapses in fact into that unconscious working and weaving of spirit, i.e. into pure feeling, or pure thinghood.

The self-alienated notion — for the notion still stands here at the level of such alienation-does not, however, recognize this identical nature constituting both sides, — the movement of self-consciousness and its absolute Reality,-does not recognize the identity of their nature, which, in point of fact, is their very substance and subsistence. Since the notion is not aware of this unity, absolute Reality has significance for it merely in the form of an objective beyond, while the consciousness making these distinctions, and in this way keeping the ultimate reality outside itself, is treated as a finite consciousness.

Regarding that Absolute Being, enlightenment itself falls out with itself in the same way as it did formerly with belief, and is divided between the views of two parties. One party proves itself to be victorious by the fact that it breaks up into two parties; for in that fact it shows it possesses within it

the principle it combats, and consequently shows it has abolished the one-sidedness with which it formerly made its appearance. The interest which was divided between it and the other, now falls entirely within it, and forgets the other, because that interest finds lying in it alone the opposition on which its attention is directed. At the same time, however, the opposition has been lifted into the higher victorious element, where it manifests itself in a clarified form. So that the schism that arises in one party, and seems a misfortune, demonstrates rather its good fortune.

The pure essence itself has in it no distinction; consequently distinction is reached by two such pure essences being put forward for consciousness to be aware of, or by a twofold consciousness of the pure reality. The pure absolute essence is only in pure thought, or rather it is pure thought itself, and thus absolutely beyond the finite, beyond self-consciousness, and is merely the ultimate essence in a negative sense. But in this way it is just being, the negative of self-consciousness. Being negative of self-consciousness, it is also related to self-consciousness. It is external being, which, placed in relation to self-consciousness within which distinctions and determinations fall, acquires within it the distinctions, of being tasted, seen, and so on; and the relationship is that of sense-experience and perception.

Taking the point of departure from this sense-existence, into which that negative beyond necessarily passes, but abstracting from those various ways in which consciousness is related to sense-existence, there is left pure *matter* as that in which consciousness weaves and moves inarticulately within itself. In dealing with this, the essential point to note is that pure matter is merely what remains over when we abstract from seeing, feeling, tasting, etc., i.e. it is not what is seen, tasted, felt, and so on; it is not matter that is seen, felt, or tasted, but colour, a stone, a salt, and so on. Matter is really pure abstraction; and, being so, we have here the pure essential nature

of thought, or pure thought itself, as the Absolute without predicates, undetermined, having no distinctions within it.

The one kind of enlightenment calls absolute Being that predicateless Absolute, which exists in thought beyond the actual consciousness from which this enlightenment started; the other calls it matter. If they were distinguished as Nature and Spirit or God, the unconscious inner working and weaving would have nothing of the wealth of developed life required in order to be nature, while Spirit or God would have no self-distinguishing consciousness. Both, as we saw, are entirely the same notion; the distinction lies not in the objective fact, but purely in the diversity of starting-point adopted by the two developments of thought, and in the fact that each stops at its own special point in the thought-process. If they rose above that, their thoughts would coincide, and they would find what to the one is, as it professes, a horror, and to the other a folly, is one and the same thing. For to the one, absolute Being is in its pure thought, or is immediately *for* pure consciousness — is outside finite consciousness, is the negative beyond of finite mind. If it would reflect that in part that simple immediacy of thought is nothing else than pure being, that in part, again, what is negative for consciousness is at the same time related to consciousness — that in the negative judgment the copula "is" connects as well as separates the two factors — it would come to see that this beyond, having the character of an external existence, stands in a relation to consciousness, and that in so doing it means the same as what is called pure matter. The missing moment of *presence* would then be secured.

The other enlightenment starts from sense-existence; it then abstracts from the sensuous relation of tasting, seeing, etc., and turns sense-existence into purely inherent being (*Ansich*), absolute matter, something neither felt nor tasted. This being has in this way become the inner reality of pure consciousness, the ultimately simple without predicates; it is the pure

notion, *qua* notion whose being is implicit, or it is pure thought within itself. This insight in its conscious activity does not go through the reverse process of passing from being, which is purely being, to an opposite in thought, which is the same as mere being, or does not go from the pure positive to the opposite pure negative; although after all the positive is really pure simply and solely through negation, while the negative *qua* pure is self-identical and one within itself, and precisely on that account positive.

Or again, these two have not come to the notion found in Descartes' metaphysics that being and thought are inherently the same; they have not arrived at the thought that being, pure being, is not a concrete actual reality, but pure abstraction, and conversely that pure thought, self-identity or inner essence, is partly the negative of self-consciousness, and consequently is being, and partly, *qua* immediate simple entity, is like wise nothing else than being. Thought is thinghood, or thinghood is thought.

The real essence is here divided asunder in such a way that, to begin with, it appertains to two specifically distinct modes of thinking. In part, the real must hold distinction in itself; in part, just by so doing, both ways of considering it merge into one; for then the abstract moments, of pure being and the negative, by which their distinction is expressed, are united in the object with which these modes of treatment deal.

The universal common to both is the abstraction of pure self-thinking, of pure quivering within the self. This simple motion of rotating on its own axis is bound to resolve itself into separate moments, because it is itself only motion by distinguishing its own moments. This distinguishing of the moments leaves the unmoved [unity] behind as the empty shell of pure being, that is no longer actual thought, has no more life within it; for *qua* distinction this process is all the content. The process, which thus puts itself outside that unity thereby constitutes, however, the shifting change — a change that does not return into itself-of the moments of being-in-itself, of

being-for-another, and of being-for-self: it is actual reality in the way this is object for the concrete consciousness of pure insight — viz. Utility.

Bad as utility may look to belief or sentimentality, or even to the abstraction that calls itself speculation, and deals with the inherent nature in fixed isolation; yet it is that in which pure insight finds its realization and is itself the object for itself, an object which insight now no longer repudiates, and which, too, it does not consider as the void or the pure beyond. For pure insight, as we saw, is the living notion itself, the self-same pure personality, distinguishing itself within itself in such a way that each of the distinguished elements is itself pure notion, i.e. is *eo ipso* not distinct; it is simple undifferentiated pure self-consciousness, which is for itself as well as in itself within an immediate unity. Its inherent being (*Ansichsein*) is therefore not fixed and permanent, but at once ceases, in its distinction, to be something distinctive. A being of that kind, however, which is immediately without support and cannot stand of itself, has no being in itself, no inherent existence, it is essentially for something else, which is the power that consumes and absorbs it. But this second moment, opposed to that first one, disappears just as immediately as the first; or, rather, *qua* being merely for some other, it is the very process of disappearing, and there is thus affirmed being that has turned back into itself, being for itself. This simple being-for-self, however, *qua* self-identity, is rather an objective being, or is thereby for an other.

This nature of pure insight in thus unfolding and making explicit its moments, in other words insight *qua* object, finds expression in the useful, the profitable. What is useful is a thing, something that subsists in itself; this being in itself is at the same time only a pure moment: it is in consequence absolutely for something else, but is equally for an other merely as it is in itself: these opposite moments have returned into the indivisible unity of being-for-self. While, however, the useful doubtless

expresses the notion of pure insight, it is all the same not insight as such, but insight as conscious presentation, or as object for insight. It is merely the restless shifting change of those moments, of which one is indeed Being-returned-into-itself, but merely as being-for-itself, i.e. as abstract moment, appearing on one side over against the others. The useful itself does not consist in the negative fact of having these moments in their opposition at the same time undivided in one and the same respect, of having them as a form of thought *per se* in the way they are *qua* pure insight. The moment of being-for-self is doubtless a phase of usefulness, but not in the sense that it swamps the other moments, being-per-se and being-for-another; if so, it would be the whole self. In the useful, pure insight thus possesses as its object its own peculiar notion in the pure moments constituting its nature; it is the consciousness of this metaphysical principle, but not yet its conceptual comprehension, it has not yet itself reached the unity of being and notion. Because the useful still appears before insight in the form of an object, insight has a world not indeed any longer a world all by itself and self-contained, but still a world all the same, which it distinguishes from itself. Only, since the opposites have appeared at the supreme point of the notion, the next step will be for them to collide and collapse together and for enlightenment to experience the fruits of its deeds.

When we looked at the object reached in relation to this entire sphere of spiritual life, we found the actual world of culture summed up in the vanity of self-consciousness — in independent self-existence, whose content is drawn from the confusion characteristic of culture, and which is still the individual notion, not yet the self-conscious (*für sich*) universal notion. Returned into itself, however, that (individual) notion is pure insight — pure consciousness *qua* pure self or negativity, just as belief, too, is pure consciousness, *qua* pure thought or positivity. Belief finds in that self the moment that makes it complete; — but, perishing through being thus

completed, it is in pure insight that we now see both moments as absolute Being, which is purely thought-constituted or is a negative entity, and as matter, which is the positive entity.

This completion still lacks that actual reality of self-consciousness, which belongs to the vain and empty type of consciousness — the world out of which thought raised itself up to itself. What is thus wanting is reached in the fact of utility so far as pure insight secures positive objectivity there; pure insight is thereby a concrete actual consciousness satisfied within itself. This objectivity now constitutes its world, and is become the final and true outcome of the entire previous world, ideal as well as real. The first world of spirit is the expanded realm of spirit's self-dispersing existence and of certainty of self in separate individual shapes and forms: just as nature disperses its life in an endless multiplicity of forms and shapes, without the generic principle of all the forms being present therein. The second world contains the generic principle, and is the realm of the ultimate inherent nature (*Ansichseyns*) or the essential truth, over against that individual certainty. The third world, however, that of the useful, is the truth which is certainty of self as well. The realm of the truth of belief lacks the principle of concrete actuality, or of certainty of self in the sense of this individual self. But, again, concrete actuality, or certainty of self *qua* this individual, lacks the ultimate inherent nature (*Ansich*). In the object of pure insight both worlds are united. The useful is the object so far as self-consciousness sees through it, and individual certainty of self finds its enjoyment (its self-existence) in it; self-consciousness sees into it in this manner, and this insight contains the true essence of the object (which consists in being something seen through, in other words, in being for an other). This insight is thus itself true knowledge; and self-consciousness directly finds in this attitude universal certainty of itself as well, has its pure consciousness in this attitude, in which truth as well as immediateness and

actuality are united. Both worlds are reconciled and heaven is transplanted to the earth below.

iii

Absolute Freedom and Terror

CONSCIOUSNESS has found its notion in the principle of utility. But that notion is partly an object still, partly, for that very reason, still a purpose, of which consciousness does not yet find itself to be immediately possessed. Utility is still a predicate of the object, not a subject, not its immediate and sole actuality. It is the same thing that appeared before when we found that self-existence (being-for-self) had not yet shown itself to be the substance of the remaining moments, a process by which the useful would be directly nothing else than the self of consciousness and this latter thereby in its possession.

This revocation of the form of objectivity which characterizes the useful has, however, already taken effect implicitly, and as the outcome of this immanent internal revolution there comes to light the actual revolution of concrete actuality, the new mode of conscious life-absolute freedom.

This is so because in point of f act there is here no more than an empty semblance of objectivity separating self-consciousness from actual possession. For, in part, all the validity and permanence of the various specific members of the organization of the world of actuality and belief have as a whole returned into this simple determination, as into their ground and their indwelling spirit: in part, however, this organized world has nothing peculiarly its own left for itself, it is instead pure metaphysics pure notion or knowledge of self-consciousness. That is to say, from the whole and complete being of the useful *qua* object consciousness recognizes that its inherent nature, its being-in-itself, is essentially a being for another;

mere being-in-itself since it is self-less, is ultimately and in truth a passive entity, or something that is for another self. The object, however, is present to consciousness in this abstract form of purely inherent being, of pure being-in-itself; for consciousness is the activity of pure insight, the separate moments of which take the pure form of notions.

Self-existence, being-for-self, however, into which being for another returns, in other words the self, is not a self of what is called object, a self all its own and different from the ego: for consciousness *qua* pure insight is not an individual self, over against which the object, in the sense of having a self all its own, could stand, but the pure notion, the gazing of the self into self, the literal and absolute seeing itself doubled. The certainty of itself is the universal subject, and its notion knowing itself is the essential being of all reality. If the useful was merely the shifting change of the moments, without returning into its own proper unity, and was still hence an object for knowledge to deal with, then it ceases to be this now. For knowing is itself the process and movement of those abstract moments; it is the universal self, the self of itself as well as of the object, and, being universal, is the unity of this process, a unity that returns into itself.

This brings on the scene spirit in the form of absolute freedom. It is the mode of self-consciousness which clearly comprehends that in its certainty of self lies the essence of all the component spiritual spheres of the concrete sensible as well as of the supersensible world, or, conversely, that essential being and concrete actuality consist in the knowledge consciousness has of itself.

It is conscious of its pure personality and with that of all spiritual reality; and all reality is solely spirituality; the world is for it absolutely its own will, and this will is universal will. And further, this will is not the empty thought of will, which is constituted by giving a silent assent, or an assent through a representative, a mere symbol of willing; it is concretely

embodied universal will, the will of all individuals as such. For will is in itself the consciousness of personality, of every single one; and it has to be as this true concrete actual as self-conscious essential being of each and every personality, so that each single and undivided does everything, and what appears as done by the whole is at once and consciously the deed of every single individual.

This undivided substance of absolute freedom puts itself on the throne of the world, without any power being able to offer effectual resistance. For since in very truth consciousness is alone the element which furnishes spiritual beings or powers with their substance, their entire system, which is organized and maintained through division into separate spheres and distinct wholes, has collapsed into a single whole, when once the individual consciousness conceives the object as having no other nature than that of self-consciousness itself, or conceives it to be absolutely the notion. What made the notion an existential object was the distinguishing it into separate and separately subsisting spheres; when, however, the object becomes a notion there is nothing fixedly subsisting left in it; negativity has pervaded all its moments. It exists in such a way that each individual consciousness rises out of the sphere assigned to it, finds no longer its inmost nature and function in this isolated area, but grasps itself as the notion of will, grasps all the various spheres as the essential expression of this will, and is in consequence only able to realize itself in a work which is a work of the whole. In this absolute freedom all social ranks or classes, which are the component spiritual factors into which the whole is differentiated, are effaced and annulled; the individual consciousness that belonged to any such group and exercised its will and found its fulfilment there, has removed the barriers confining it; its purpose is the universal purpose, its language universal law, its work universal achievement.

The object and the element distinguished have here lost the meaning of utility, which was a predicate of all real being; consciousness does not commence its process with the object as a sort of alien element after dealing with which it then and only then returns into itself; the object is for it consciousness itself. The opposition thus consists solely in the distinction of individual and universal consciousness. But the individual itself is directly on its own view that which had merely the semblance of opposition; it is universal consciousness and will. The remote beyond that lies remote from this its actual reality, hovers over the corpse of the vanished independence of what is real or believed to be, and hovers there merely as an exhalation of stale gas, of the empty *être suprême.*

By doing, away with the various distinct spiritual spheres, and the restricted and confined life of individuals, as well as both its worlds, there thus remains merely the process of the universal self-consciousness within itself — a process which consists in a reciprocal interaction between its universal form and personal consciousness. The universal will goes into itself, is subjectivized, and becomes individual will, to which the universal law and universal work stand opposed. But this individual consciousness is equally and immediately conscious of itself as universal will; it is fully aware that its object is a law given by that will, a work performed by that will; in exercising and carrying out its activity, in creating objectivity, it is thus doing nothing individual, but executing laws and functions of the state.

This process is consequently the interaction of consciousness with itself, in which it lets nothing break away and assume the shape of a detached object standing over against it. It follows from this, that it cannot arrive at a positive accomplishment of anything, either in the way of universal works of language or of those of actual reality, either in the shape of laws and universal regulations of conscious freedom, or of deeds and works of active freedom.

The accomplished result at which this freedom, that gives itself consciousness, might manage to arrive, would consist in the fact that such freedom *qua* universal substance made itself into an object and an abiding existence. This objective otherness would there be the differentiation which enabled it to divide itself into stable spiritual spheres and into the members of distinct powers. These spheres would partly be the thought-constituted factors of a power that is differentiated into legislative, judicial and executive; but partly they would be the substantial elements we found in the real world of spiritual culture; and, since the content of universal action would be more closely taken note of, they would be the particular spheres of labour, which are further distinguished as more specific "estates" or social ranks. Universal freedom, which would have differentiated itself in this manner into its various parts, and by the very fact of doing so would have made itself an existing substance, would thereby be free from particular individualities, and could apportion the plurality of individuals to its several organic parts.

The activity and being of personality would, however, find itself by this process confined to a branch of the whole, to one kind of action and existence; when placed in the element of existence, personality would bear the meaning of a determinate personality; it would cease to be in reality universal self-consciousness. Neither by the idea of submission to self-imposed laws, which would assign to it only a part of the whole work, nor by its being represented when legislation and universal action take place, does self-consciousness here let itself be cheated out of the actual reality — the fact that *itself* lays down the law and itself accomplishes a universal and not a particular task. For in the case where the self is merely represented and ideally presented (*vorgestellt*), there it is not actual: where it is by proxy, it is not.

Just as the individual self-consciousness does not find itself in this universal work of absolute freedom *qua* existing substance, as little does it find itself in the deeds proper, and specific individual acts of will, performed by this substance. For the universal to pass into a deed, it must gather itself into the single unity of individuality, and put an individual consciousness in the forefront; for universal will is an actual concrete will only in a self that is single and one. Thereby, however, all other individuals are excluded from the entirety of this deed, and have only a restricted share in it, so that the deed would not be a deed of real universal self-consciousness.

Universal freedom can thus produce neither a positive achievement nor a deed; there is left for it only negative action; it is merely the rage and fury of destruction.

But the highest reality of all and the reality most of all opposed to absolute freedom, or rather the sole object it is yet to become aware of, is the freedom and singleness of actual self-consciousness itself. For that universality which does not let itself attain the reality of organic articulation, and whose purpose is to maintain itself in unbroken continuity, distinguishes itself within itself all the while, because it is process or consciousness in general. Moreover, on account of its own peculiar abstraction, it divides itself into extremes equally abstract, into the cold unbending bare universality, and the hard discrete absolute rigidity and stubborn atomic singleness of actual self-consciousness. Now that it is done with destroying the organization of the actual world, and subsists in isolated singleness, this is its sole object, an object that has no other content left, no other possession, existence and external extension, but is merely this knowledge of itself as absolutely pure and free individual self. The point at which this object can be laid hold of is solely its abstract existence in general.

The relation, then, of these two, since they exist for themselves indivisibly and absolutely and thus cannot arrange for a common part to act as a means for connecting them, is pure negation entirely devoid of mediation, the negation, moreover, of the individual as a factor existing within the universal. The sole and only work and deed accomplished by universal freedom is therefore *death* — a death that achieves nothing, embraces nothing within its grasp; for what is negated is the unachieved, unfulfilled punctual entity of the absolutely free self. It is thus the most cold-blooded and meaningless death of all, with no more significance than cleaving a head of cabbage or swallowing a draught of water.

In this single expressionless syllable consists the wisdom of the government, the intelligence of the universal will; this is how it fulfils itself. The government is itself nothing but the self-established focus, the individual embodiment of the universal will. Government, a power to will and perform proceeding from a single focus, wills and performs at the same time a determinate order and action. In doing so it, on the one hand, excludes other individuals from a share in its deed, and, on the other, thereby constitutes itself a form of government which is a specifically determinate will and *eo ipso* opposed to the universal will. By no manner of means, therefore, can it exhibit itself as anything but a *faction*. The victorious faction only is called the government; and just in that it is a faction lies the direct necessity of its overthrow; and its being government makes it, conversely, into a faction and hence guilty. When the universal will fastens on this concrete action of the government and treats this as the crime which the government has committed against the universal will, then the government on its side has nothing tangible and external left whereby to establish and show the guilt of the will opposing itself to it; for what thus stands opposed to it as concrete actual universal will is merely unreal pure will, mere intention. Being suspected, therefore, takes the place, or has the

significance and effect, of being guilty; and the external reaction against this reality that lies in bare inward intention, consists in the and barren destruction of this particular existent self, in whose case there is nothing else to take away but its mere existence.

In this its characteristically peculiar performance, absolute freedom becomes objective to itself, and self-consciousness finds out what this freedom is. In itself it is just this abstract self-consciousness, which destroys all distinction and all subsistence of distinction within itself. It is object to itself in this shape; the terror of death is the direct apprehension (*Anschauung*) of this its negative nature. This its reality, however, absolute free self-consciousness finds quite different from what its own notion of itself was, viz. that the universal will is merely the positive substance of personality, and that this latter knows itself in it only positively, knows itself preserved there. Rather for this self -consciousness, which *qua* pure insight completely separates its positive and negative nature — separates the unpredicated Absolute *qua* pure thought and *qua* pure matter — the absolute transition of the one into the other is found here present in its reality. The universal will, *qua* absolutely positive concrete self-consciousness — because it is this self-conscious actuality raised to the level of pure thought or abstract matter — turns round into the negative entity, and shows itself at the same time to be what cancels and does away with self-thinking or self-consciousness.

Absolute freedom *qua* pure self-identity of universal will thus carries with it negation; but in doing so contains distinction in general, and develops this again as concrete actual difference. For pure negativity finds in the self-identical universal will the element of subsistence, or the substance in which its moments get their realization; it has the matter which it can convert into the specific nature of its own being; and in so far as this substance has manifested itself to be the negative element for the individual

consciousness, the organization of the spiritual spheres or "masses" of the substance, to which the plurality of conscious individuals is assigned, thus takes shape and form once more. These individuals, who felt the fear of death, their absolute lord and master, submit to negation and distinction once more, arrange themselves under the "spheres", and return to a restricted. and apportioned task, but thereby to their substantial reality.

Out of this tumult spirit would be, hurled back upon its starting point, the ethical world and the real world of spiritual culture, which would thus have been merely refreshed and rejuvenated by the fear of the lord, that has again entered men's hearts. Spirit would have anew to traverse and continually repeat this cycle of necessity, if only complete interpenetration of self-consciousness and the substance were the final result: an interpenetration in which self-consciousness, which has experienced the force of its universal nature operating negatively upon it, would try to know and find itself not as this particular self-consciousness but only as universal, and hence, too, would be able to endure the objective reality of universal spirit, a reality, excluding self-consciousness *qua* particular.

But this is not the form the final result assumed. For in absolute freedom there was no reciprocal interaction either between an external world and consciousness, which is absorbed in manifold existence or sets itself determinate purposes and ideas, or between consciousness and an external objective world, be it a world of reality or of thought. What that freedom contained was the world absolutely in the form of consciousness, as a universal will, and, along with that, self-consciousness gathered out of all the dispersion and manifoldness of existence or all the manifold ends and judgments of mind, and concentrated into the bare and simple self. The form of culture, which it attains in interaction with that essential nature, is, therefore, the grandest and the last, is that of seeing its pure and simple reality immediately disappear and pass away into empty nothingness. In the

sphere of culture itself it does not get the length of viewing its negation or alienation in this form of pure abstraction; its negation is negation with a filling and a content-either honour and wealth, which it gains in the place of the self that it has alienated from itself; or the language of *esprit* and insight, which the distraught consciousness acquires; or, again, the negation is the heaven of belief or the principle of utility belonging to the stage of enlightenment. All these determinate elements disappear with the disaster and ruin that overtake the self in the state of absolute freedom; its negation is meaningless death, sheer horror of the negative which has nothing positive in it, nothing that gives a filling.

At the same time, however, this negation in its actual manifestation is not something alien and external. It is neither that universal background of necessity in which the moral world is swamped, nor the particular accident of private possession, the whims and humours of the owner, on which the distraught consciousness finds itself dependent; it is universal will, which in this its last abstraction has nothing positive, and hence can give nothing in return for the sacrifice. But just on that account this will is in unmediated oneness with self-consciousness, it is the pure positive because it is the pure negative; and that meaningless death, the unfilled, vacuous negativity of self, in its inner constitutive principle, turns round into absolute positivity. For consciousness, the immediate unity of itself with universal will, its demand to know itself as this particular determinate centre in the universal will, is changed and converted into the absolutely opposite experience. What it loses there, is abstract being, the immediate existence of that insubstantial centre; and this vanished immediacy is the universal will as such which it now knows itself to be, so far as it is superseded and cancelled immediacy, so far as it is pure knowledge or pure will. By this means it knows that will to be itself, and knows itself to be essential reality; but not as the immediate essence, not will as revolutionary government or

anarchy struggling to establish an anarchical constitution, nor itself as a centre of this faction or the opposite; the universal will is its pure knowing and willing, and it is universal will *qua* this pure knowledge and volition. It does not lose itself there, for pure knowledge and volition is it far more than that atomic point of consciousness. It is thus the interaction of pure knowledge with itself; pure knowledge *qua* essential reality is universal will, while this essence is simply and solely pure knowledge. Self-consciousness is thus pure knowledge of essential reality in the sense of pure knowledge. Furthermore, *qua* single self it is merely the form of the subject or concrete real action, a form which by it is known as form. In the same way objective reality, "being", is for it absolutely self-less form; for that objective reality would be what is not known: this knowledge, however, knows knowledge to be the essential fact.

Absolute freedom has thus squared and balanced the self-opposition of universal and single will. The self-alienated type of mind, driven to the acme of its opposition, where pure volition and the purely volitional agent are still kept distinct, reduces that opposition to a transparent form, and therein finds itself.

Just as the realm of the real and actual world passes over into that of belief and insight, absolute freedom leaves its self-destructive sphere of reality, and passes over into another land of self-conscious spirit, where in this unreality freedom is taken to be and is accepted as the truth. In the thought of this truth spirit refreshes and revives itself (so far as spirit is thought and remains so), and knows this being which self-consciousness involves [viz. Thought] to be the complete and entire essence of everything. The new form and mode of experience that now arises is that of the Moral Life of Spirit.

C

Spirit in the Condition of Being Certain of Itself: Morality

Translator's comments: The following section deals with the final and highest stage in the life of finite spiritual experience as realized in the concrete form of a historical society. Here the substance of the social order is the real content of the self-conscious individual: that substance has become subjectified; we have therefore a self-contained spiritual subject. The discordance involved in the sphere of culture and enlightenment is overcome by the self knowing and realizing itself as a completely universal self-determining free will, its world within itself, and its self its own world. Each reflects the whole (the totality of social life) in itself so perfectly that what it does is transparently the doing of the whole as much as its own doing. Such a sphere of spiritual existence is Morality, the all-sufficient spiritual order of the finite spirit as an individual. The meaning assigned to "morality" here is that expressed by Kant when he says that morality is "the relation of actions to the autonomy of the will, i.e. to possible universal legislation through maxims of the will". In other words, all the universality constituting the interrelations of finite spirits in a society is epitomized in the soul of the acting individual, who can thus quite legitimately look upon itself as the self-regulating source of all universal conditions of action.

It is inevitable that such a concrete mode of experience should have and should pass through various stages in the process of various aspects fully realizing its nature. The individual may lay exclusive stress on the self-completeness which he possesses through being the source and origin of his own laws. His self-legislative function, just because it carries with it the sense of universality, may appear so supremely important that all the actual detail of his life comes to be treated as external, indifferent, and contingent. This detail no doubt is essential to give body and substance to his spiritual individuality, but the universality of his will so far transcends each and every detail of content as to seem by itself the sole and all-sufficient reality

of his being. The content of his life only enters into consideration as an element to be regulated and made to conform to the universal: the relation so constituted between content and universal is found in the consciousness of Duty. Since the content is thus subordinate, though absolutely essential to give even meaning to the idea and the "fulfilment" of duty, and since the universal is the supremely important fact, not merely is duty to be fulfilled for duty's sake, but the duty in question is pure duty. The "good will" is the purely universal will, and is the only will in the world from this point of view.

In the first section (a) Hegel analyses this phase of the moral life.

The historical material the writer has in mind is a moral attitude which came into prominence at the time of the Romantic movement towards the end of the eighteenth and the beginning of the nineteenth centuries. It found its philosophical expression in the moral theories of Kant and Fichte; and Lessing may be taken as a typical representative in literature of the same attitude.

Self-Assured Spirit: Morality

THE ethical order of the community found its destiny consummated and its truth realized in the spirit that merely passed away within it — the individual self. This legal person, however, has its substance and its fulfilment outside the ethical order. The process of the world of culture and belief does away with this abstraction of a mere person; and by the completion of the process of estrangement, by reaching the extremity of abstraction, the self of spirit finds the substance become first the universal will, and finally its own possession. Here, then, knowledge seems at last to have become entirely adequate to the truth at which it aims; for its truth is this knowledge itself. All opposition between the two sides has vanished,

and that, too, not *for us* (who are tracing the process), not merely *implicitly*, but actually for self-consciousness itself. That is to say, self-consciousness has itself got the mastery over the opposition which consciousness involves. This latter rests on the opposition between certainty of self and the object. Now, however, the object for it *is* the certainty of self, knowledge: just as the certainty of itself as such has no longer ends of its own, is no longer conditioned and determinate, but is pure knowledge.

Self-consciousness thus now takes its knowledge to be the substance itself. This substance is, for it, at once immediate and absolutely mediated in one indivisible unity. It is immediate — just like the "ethical" consciousness, it knows and itself does its duty, and is bound to its duty as to its own nature: but it is not character, as that ethical consciousness was, which in virtue of its immediacy is a determinate type of spirit, belongs merely to one of the essential features of ethical life, and has the characteristic of not being conscious explicit knowledge. It is, again, absolute mediation, like the consciousness developing itself through culture and like belief; for it is essentially the movement of the self to transcend the abstract form of immediate existence, and become consciously universal- and yet to do so neither by simply estranging and rending itself as well as reality, nor by fleeing from it. Rather, it is for itself directly and immediately present in its very substance; for this substance is its knowledge, it is the pure certainty of self become transparently visible. And just this very immediacy, which constitutes its own actual reality, is the entire actuality; for the immediate is being and *qua* pure immediacy, immediacy purified by thoroughgoing negativity, this immediacy is pure being, is being in general, is all being.

Absolute essential Being is, therefore, not exhausted by the characteristic of being the simple essence of thought; it is all actuality, and this actuality exists merely as knowledge. What consciousness did not know would have

no sense and can be no power in its life. Into its self-conscious knowing will, all objectivity, the whole world, has withdrawn. It is absolutely free in that it knows its freedom; and just this very knowledge of its freedom is its substance, its purpose, its sole and only content.

a

The Moral View of the World

SELF-CONSCIOUSNESS knows and accepts duty as the Absolute. It is bound by that alone, and this substance is its own pure conscious life; duty cannot, for it, take on the form of something alien and external. When thus shut up and confined within itself, however, moral self-consciousness is not yet affirmed and looked at as *consciousness*. The object is immediate knowledge, and being thus permeated purely by the self, is not *object*. But, self-consciousness being essentially mediation and negativity, there is implied in its very conception relation to some otherness; and thus it is *consciousness*. This other, because duty constitutes the sole essential purpose and object of self-consciousness, is a reality completely devoid of significance for self-consciousness. But again because this consciousness is so entirely confined within itself, it takes up towards this otherness a perfectly free and detached attitude; and the existence of this other is, therefore, an existence completely set free from self-consciousness, and in like manner relating itself merely to itself. The freer self-consciousness becomes, the freer also is the negative object of its consciousness. The object is thus a complete world within itself, with an individuality of its own, an independent whole of laws peculiar to itself, as well as an independent procedure and an unfettered active realization of those laws. It is a *nature* in general, a nature whose laws and also whose action belong to

itself as a being which is not disturbed about the moral self-consciousness, just as the latter is not troubled about it.

Starting with a specific character of this sort, there is formed and established a moral outlook on the world which consists in a process of relating the implicit aspect of morality (*moralisches Ansichseyn*) and the explicit aspect (*moralisches Fürsichseyn*). This relation presupposes both thorough reciprocal indifference and specific independence as between nature and moral purposes and activity; and also, on the other side, a conscious sense of duty as the sole essential fact, and of nature as entirely devoid of independence and essential significance of its own. The moral view of the world, the moral attitude, consists in the development of the moments which are found present in this relation of such entirely antithetic and conflicting presuppositions.

To begin with, then, the moral consciousness in general is presupposed. It takes duty to be the essential reality: itself is actual and active, and in its actuality and action fulfils duty. But this moral consciousness, at the same time, finds before it the assumed freedom of nature: it learns by experience that nature is not concerned about giving consciousness a sense of the unity of its reality with that of nature, and hence discovers that nature may let it become happy, but perhaps also may not. The non-moral consciousness on the other hand finds, by chance perhaps, its realization where the moral consciousness sees merely an occasion for acting, but does not see itself obtaining through its action the happiness of performance and of the enjoyment of achievement. It therefore finds reason for bewailing a situation where there is no correspondence between itself and existence, and lamenting the injustice which confines it to having its object merely in the form of pure duty, but refuses to let it see this object and itself actually realized.

The moral consciousness cannot renounce happiness and drop this element out of its absolute purpose. The purpose, which is expressed as pure duty,. essentially implies retention of individual self-consciousness and maintenance of its claims. Individual conviction and knowledge thereof constituted a fundamental element in morality. This moment in the objectified purpose, in duty fulfilled, is the individual consciousness seeing itself as actually realized. In other words, this moment is that of enjoyment, which thus lies in the very principle of morality, not indeed of morality immediately in the sense of a frame of mind, but in the principle of the *actualization* of morality. Owing to this, however, enjoyment is also involved in morality, as a mood, for morality seeks, not to remain a frame of mind as opposed to action, but to act or realize itself. Thus the purpose, expressed as a whole along with the consciousness of its elements or moments, is that duty fulfilled shall be both a purely moral act and a realized individuality, and that nature, the aspect of individuality in contrast with abstract purpose, shall be one with this purpose.

While experience must necessarily bring to light the disharmony between the two aspects, seeing that nature is detached and free nevertheless duty is alone the essential fact and nature by contrast is devoid of self-hood. That purpose in its entirety, which the harmony of the two constitutes, contains within it actuality itself. It is, at the same time, the thought of actuality. The harmony of morality and nature, or-seeing that nature is taken account of merely so far as consciousness finds out nature’s unity with it — the harmony of morality and happiness, is thought of as necessarily existing; it is *postulated.* For to postulate or demand means that something is *thought as being* which is not yet actual — a necessity affecting, not the conception *qua* conception, but existence. But necessity is at the same time essentially relation through the conception. The postulated existence thus is not something that concerns the imagination of some

chance individual consciousness, but is implied in the very notion of morality itself, whose true content is the unity of pure with individual consciousness. It falls to the individual consciousness to see that this unity is, for it, an actuality: — which means happiness as regards the content of the purpose, and existence in general as regards its form. The existence thus demanded-the unity of both — is therefore not a wish, nor, looked at *qua* purpose, is it of such a kind as to be still uncertain of attainment; the purpose is rather a demand of *reason,* or an immediate certainty and presupposition of reason.

The first experience above referred to and this postulate are not the only experience and postulate; a whole round of postulates comes to light. For nature is not merely this completely free external mode in which, as a bare pure object, consciousness has to realize its purpose. Consciousness is *per se* essentially something *for* which this other detached reality exists, i.e. it is itself something contingent and natural. This nature, which is properly its own, is *sensibility,* which, taking the form of volition, in the shape of Impulses and Inclinations, has by itself a determinate essential being of its own, i.e. has specific single purposes, and thus is opposed to pure will with its pure purpose. In contrast with this opposition, however, pure consciousness rather takes the relation of sensibility to it, the absolute unity of sensibility with it, to be the essential fact. Both of these, pure thought and sensibility, are essentially and inherently *one* consciousness, and pure thought is just that for which and in which this pure unity exists; but for it *qua* consciousness the opposition between itself and its impulses holds. In this conflict between reason and sensibility, the essential thing for reason is that the conflict should be resolved, and that the unity of both should come out as a result: not the original unity which consisted in both the opposites being in one individual, but a unity which arises out of the *known* opposition of the two. So attained, such a unity is then actual morality; for

in it is contained the opposition through which the self is a consciousness, or first becomes concrete and in actual fact self, and at the same time universal. In other words, we find there expressed that process of mediation which, as we see, is essential to morality.

Since, of the two factors in opposition, sensibility is otherness out and out, is the negative, while, on the other hand, pure thought of duty is the ultimate essence which cannot possibly be surrendered in any respect, it seems as if the unity produced can be brought about only by doing away with sensibility. But since sensibility is itself a moment of this process of producing the unity, is the moment of actuality, we have, in the first instance, to be content to express the unity in this form — sensibility should be in conformity with morality.

This unity is likewise a *postulated* existence; it is not there as a fact; for what is there is consciousness, or the *opposition* of sensibility and pure consciousness. All the same, the unity is not a something *per se* like the first postulate, in which free external nature constitutes an aspect and the harmony of nature with moral consciousness in consequence falls outside the latter. Rather, nature is here that which lies within consciousness; and we have here to deal with morality (*Moralität*) as such, with a harmony which is the active self's very own. Consciousness has, therefore, of itself to bring about this harmonious unity, and "to be always making progress in morality". The completion of this result, however, has to be pushed away into the remote infinite, because if it actually entered the life of consciousness as an actual fact, the moral consciousness would be done away with. For morality is only moral consciousness *qua* negative force; sensibility has merely a negative significance for the consciousness of pure duty, it is something merely "*not* in conformity with" duty. By attaining that harmony, however, morality *qua* consciousness, i.e. its actuality, passes away, just as in the moral consciousness or actuality its harmony vanishes.

The completion is, therefore, not to be reached as an actual fact; it is to be thought of merely as an absolute task or problem, i.e. one which remains a problem pure and simple. Nevertheless, its content has to be thought as something which unquestionably has to be, and must not remain a problem: whether we imagine the moral consciousness quite cancelled in the attainment of this goal, or riot. Which of these exactly is the case, can no longer be clearly distinguished in the dim distance of infinitude, to which the attainment of the end has to be postponed, just because we cannot decide the point. We shall be, strictly speaking, bound to say that a definite idea on the matter ought to be of no interest and ought not to be sought for, because this leads to contradictions — the contradiction involved in an undertaking that at once ought to remain an undertaking and yet ought to be carried out, and the contradiction involved in the morality which is to be no longer consciousness, i.e. no longer actual. By adopting the view, however, that morality when completed would contain a contradiction, the sacredness of moral truth would be seriously affected, and the unconditional duty would appear something unreal.

The first postulate was the harmony of morality and objective nature-the final purpose of the world: the other was the harmony of morality and will in its sensuous form, in the form if impulse, etc.-the final purpose of self-consciousness as such. The former is the harmony in the form of implicit immanent existence; the latter, the harmony in the form of explicit self-existence. That, however, which connects these two extreme final purposes which are thought, and operates as their mediating ground, is the process of concrete action itself. They are harmonies whose moments have not yet become definitely objective in their abstract distinctiveness from each other: this takes place in concrete actuality, in which the aspects appear in consciousness proper, each as the other of the other. The postulates arising by this means contain harmonies which are now both immanent and self-

existent, whereas formerly they were postulated merely separately, the one being the immanent harmony, the other self-existent.

The moral consciousness, *qua* simple knowledge and willing of pure duty, is brought, by the process of acting, into relation with an object opposed to that abstract simplicity, into relation with the manifold actuality which various cases present, and thereby assumes a moral attitude varied and manifold in character. Hence arise, on the side of content, the plurality of laws generally, and, on the side of form, the contradictory powers of intelligent knowing consciousness and of a being devoid of consciousness.

To begin with, as regards the plurality of duties, it is merely the aspect of pure or bare duty in them which the moral consciousness in general recognizes as having validity: the many duties *qua* many are determinate and, therefore, are not, as such, anything sacred for the moral consciousness. At the same time, however, being necessary, in virtue of the notion of action which implicates a manifold actuality, and hence manifold types of moral attitude, those many duties must be looked on as having a substantial existence and value. Furthermore, since they can only exist in a moral *consciousness*, they exist at the same time in another consciousness than that for which only pure duty *qua* pure duty is sacred and substantial.

It is thus postulated that there is *another* consciousness which renders them sacred, or which knows them as duties and wills them so. The first maintains pure duty indifferent towards all specific content, and duty consists merely in being thus indifferent towards it. The other, however, contains the equally essential relation to the process of action, and the *necessity,* therefore, of determinate content: since duties for this other mean determinate duties, the content is thus, for it, just as essential as the form in virtue of which the content is a duty at all. This consciousness is, consequently, such that in it the universal and the particular are, through and through, one; its essential principle is thus the same as that of the harmony

of morality and happiness. For this opposition between morality and happiness expresses in like manner the separation of the self-identical moral consciousness from that actuality which, *qua* manifold existence, opposes and conflicts with the simple nature of duty. While, however, the first postulate expresses merely the objective existential harmony between morality and nature, because nature is therein the negative of self-consciousness, is the moment of existence, this inherent harmony, on the other hand is now affirmed essentially as a type of consciousness. For existence now appears as the content of duty, as that in the determinate duty which gives it specific determinateness. The immanent harmony is thus the unity of elements which, *qua* simple ultimate elements, are essentially thought-created, and hence cannot exist except in a consciousness. This latter becomes now a master and ruler of the world, who brings about the harmony of morality and happiness, and at the same time sanctifies duties in their Multiplicity. To sanctify these duties means this much, that the consciousness of pure duty cannot straight-way and directly accept the determinate or specific duty as sacred; but because a specific duty, owing to the nature of concrete action which is something specific and definite, is likewise necessary, its necessity falls outside that consciousness and holds inside another consciousness, which thus mediates or connects determinate and pure duty, and is the reason why that specific duty also has validity.

In the concrete act, however, consciousness proceeds to work as this particular self, as completely individual: it directs its activity on actual reality as such, and takes this as its purpose, for it wants to perform something definite. "Duty in general" thus falls outside it and within another being, which is a consciousness and the sacred lawgiver of pure duty. The consciousness which acts, just because it acts, accepts the other consciousness, that of pure duty, and admits its validity immediately; this pure duty is thus a content of another consciousness, and is only indirectly

or in a mediate way sacred for the active consciousness, viz. in virtue of this other consciousness.

Because it is established in this manner that the validity, the bindingness, of duty as something wholly and absolutely sacred, falls outside the actual consciousness, this latter thereby stands altogether on one side as the incomplete moral consciousness. Just as, in regard to its *knowledge,* it is aware of itself as that whose knowledge and conviction are incomplete and contingent; in the same way, as regards its *willing*, it feels itself to be that whose purposes are affected with sensibility. On account of its "unworthiness", therefore, it cannot look on happiness as something necessary, but as a something contingent, and can only expect happiness as the result of "grace".

But though its actuality is incomplete, duty is still, so far as its pure will and knowledge are concerned, held to be the essential truth. In principle, therefore, so far as the notion is opposed to actual reality, in other words, in *thought*, it *is* perfect. The absolute Being [God] is, however, just this object of thought, and is something postulated beyond the actual. It is therefore the thought in which the morally imperfect knowledge and will are held to be perfect; and the Absolute, since it takes this imperfection to have full weight, distributes happiness according to "worthiness", i.e. according to the "merit" ascribed to the imperfect consciousness.

This completes the meaning of the moral attitude. For in the conception of moral self-consciousness the two aspects, pure duty and actual reality, are affirmed of a single unity, and thereby the one, like the other, is put forward, not as something self-complete, but as a moment, or as cancelled and transcended. This becomes consciously explicit in the last phase of the moral attitude or point of view. Consciousness, we there saw, places pure duty in another form of being than its own consciousness, i.e. it regards pure duty partly as something ideally presented, partly as what does not by

itself hold good — indeed, the non-moral is rather what is held to be perfect. In the same way it affirms itself to be that whose actuality, not being in conformity with duty, is transcended, and, *qua* transcended, or in the idea of the Absolute [God's view], no longer contradicts morality.

For the moral consciousness itself, however, its moral attitude does not mean that consciousness therein develops its own proper notion and makes this its object. It has no consciousness of this opposition either as regards the form or the content thereof; the elements composing this opposition it does not relate and compare with one another, but goes forward on its own course of development, without being the connecting principle of those moments. For it is only aware of the essence pure and simple, i.e. the object so far as this is duty, so far as this is an abstract object of its pure consciousness — in other words, it is only aware of this object as pure knowledge or as itself. Its procedure is thus merely that of *thinking*, not *conceiving*, is by way of thoughts not notions. Consequently it does not yet find the object of its actual consciousness transparently clear to itself; it is not the absolute notion, which alone grasps otherness as such, its absolute opposite, as its very self. Its own reality, as well as all objective reality, no doubt is held to be something unessential; but its freedom is that of pure thought, in opposition to which, therefore, nature has likewise arisen as something equally free. Because both are found in like manner within it-both the freedom which belongs to [external] being and the inclusion of this existence within consciousness — its object comes to be an existing object, which is at the same time merely a thought-product. In the last phase of its attitude or point of view, the content is essentially so affirmed that its being has the character of something presented, and this union of being and thinking is expressed as what in fact it is, viz.-Imagining (*Vorstellen*).

When we look at the moral view of the world and see that this objective condition is nothing else than the very principle or *notion* of moral self-

consciousness which it makes objective to itself, there arises through this consciousness concerning the form of its origin another mode of exhibiting this view of the world.

The first stage, which forms the starting-point, is the actual moral self-consciousness, or is the fact that there is such a self-consciousness at all. For the *notion* establishes moral self-consciousness in the form that, for it, all reality in general has essential being only so far as such reality is in conformity with duty; and that notion establishes this essential element as knowledge, i.e. in immediate unity with the actual self. This unity is thus itself actual, is a moral actual consciousness. The latter, now, *qua* consciousness, pictures its content to itself as an object, viz. as the final purpose of the world, as the harmony of morality with all reality. Since, however, it pictures this unity as object and is not yet the complete notion, which has mastery over the object as such, this unity is taken to be something negative of self-consciousness, i.e. the unity falls outside it, as something beyond its actual reality, but at the same time of such a nature as to be also existent, though merely thought of.

This self-consciousness, which, *qua* self-consciousness, is something other than the object, thus finds itself left with the *want* of harmony between the consciousness of duty and actual reality, and indeed its own reality. The proposition consequently now runs thus: “there is no morally complete actual self-consciousness”; and, since what is moral only is at all so far as it is complete — for duty is the pure unadulterated ultimate element (*Ansich*), and morality consists merely in conformity to this pure principle — the second proposition runs: “there is no actual existence which is moral”.

Since, however, in the third place, it is a self, it is inherently the unity of duty and actual reality. This unity thus becomes its object, as completed

morality — but as something beyond its actual reality, and yet a “beyond” which still ought to be real.

In this final goal or aim of the synthetic unity of the two first propositions, the self-conscious actuality, as well as duty, is only affirmed as a transcended or superseded moment. For neither of them is alone, neither is isolated; on the contrary, these factors, whose essential characteristic lies in being free from one another, are thus each in that unity no longer free from the other; each is transcended. Hence, as regards content, they become, as such, object, each of them holds good for the other; and, as regards form, they become object in suchwise that this reciprocal interchange is, at the same time, merely pictured — a mere idea. Or, again, the actually non-moral, because it is, at the same time, pure thought and elevated above its own actual reality, is in idea still moral, and is taken to be entirely valid. In this way the first proposition, that there *is* a moral self-consciousness, is reinstated, but bound up with the second that there is *none*; that is to say, there is one, but merely in idea. In other words, there is indeed none, but it is all the same allowed by some other consciousness to pass for one.

b

Dissemblance

Translator’s comments: The first stage fails as it stands to do complete justice to the full meaning of morality. Both elements in the spiritually complete individual are essential, and each has to be recognized. The universal must be objectified in nature (“external nature” and “sensibility”), and nature must be subjectivized in spirit. Another condition or stage of the moral consciousness, therefore, is found where the equality of value of the elements of the moral consciousness is admitted, without these elements

being completely fused into a single and total attitude. The universal is realized in many ways and forms, and each is accepted in turn as the true moral reality. The mind passes from one to the other; when one is accepted the other is set aside. The moral consciousness tries, so to say, to hide from itself the endless diversity of its appearances, simply because it clings tenaciously to the idea that the inherent self-completeness of itself is a unity *per se* which can only admit diversity on sufferance. Formerly it eliminated all diversity by eliminating the source of diversity-nature. Here it is forced to admit diversity, and yet cannot give up the claim to be an abstract single unity independent of difference. Thus its condition here is a mixture of self-realization and self-sophistication-a condition which Hegel characterizes as "Dissemblance", and which borders upon and may pass into "Hypocrisy". Hegel regards this attitude as the inevitable outcome of the preceding.

Dissemblance

IN the moral attitude of experience we see, on one side, consciousness itself produce its object in a conscious way. We find that neither does it pick up the object as something external, nor does the object come before it in an unconscious manner. Rather, consciousness throughout proceeds on an explicit ground, and from this establishes the objective reality. It thus knows this objective reality to be itself, for it is aware of itself as the active agent producing this object. It seems, in consequence, to attain here its peace and satisfaction, for this can only be found where it does not need to go any more beyond its object, because this object no longer goes beyond it. On the other side, however, it really puts the object away outside itself, as something beyond itself. But this latter self-contained entity is at the same time put there as something that is not, free from self-consciousness, but really there on behalf of and by means of it.

The moral attitude is, therefore, in fact nothing else than the developed expression of this fundamental contradiction in its various aspects. It is — to use a Kantian phrase which is here most appropriated "perfect nest" of thoughtless contradictions. Consciousness, in developing this situation, proceeds by fixing definitely one moment, passing thence immediately over to another and doing away with the first. But, as soon as it has now set up this second moment, it also "shifts" (*verstellt*) this again, and really makes the opposite the essential element. At the same time, it is conscious of its contradiction and of its shuffling, for it passes from one moment, immediately in its relation to this very moment, right over to the opposite. Because a moment has for it no reality at all, it *affirms* that very moment as real: or, what comes to the same thing, in order to assert one moment as *per se* existent, it asserts the opposite as the *per se,* existent. It thereby confesses that, as a matter of fact, it is in earnest about neither of them. The various moments of this vertiginous fraudulent process we must look at more closely.

Let us, to begin with, agree to accept the assumption that there is an actual moral consciousness, because the assumption is made directly and not with reference to something preceding; and let us turn to the harmony of morality and nature — the first postulate. It is to be immanent, not explicitly for actual conscious life, not really present; the present is rather simply the contradiction between the two. In the present, morality is taken to be something at hand, and actual reality to be so situated or "placed" that it is not in harmony with morality. The concrete moral consciousness, however, is an active one; that is precisely what constitutes the actuality of its morality. In the very process of acting, however, that "Place" or semblance is immediately "displaced", is dissembled; for action is nothing else than the actualization of the inner moral purpose, nothing but the production of an actuality constituted and determined by the purpose; in

other words, the production of the harmony of moral purpose and reality itself. At the same time the performance of the action is a *conscious* fact, it is the "presence" of this unity of reality and purpose; and because in the completed act consciousness realizes itself as a given individual consciousness, or sees existence returned into itself — and in this consists the nature of enjoyment — there is, *eo ipso,* contained in the realization of moral purpose also that form of its realization which is called enjoyment and happiness.

Action thus, as a fact, fulfils directly what it was assorted could not take place at all, fulfils what was to be merely a postulate, was to lie merely "beyond". Consciousness, therefore, expresses through its deed that it is not in earnest in making the postulate, since the meaning of acting is really that it makes a present fact of what was not to be in the present. And, since the harmony is postulated for the sake of the action — for what is to become actual through action must be implicit, otherwise the actuality would not be *possible* — the connexion of action with the postulate is so constituted that, for the sake of the action, i.e. *for the sake of the actual harmony of purpose and reality*, this harmony is put forward as *not* actual, as far away, as "beyond".

In that action takes place, the want of adaptation between purpose and reality is thus not taken seriously at all. Action itself, on the other hand, does seem to be taken seriously. But, as a matter of fact, the actual deed done is only the action of an individual consciousness, and so is itself merely something individual, and the result contingent. The end of reason, however, being the all-comprehensive universal end, is nothing short of the entire world — a final purpose which goes far beyond the content of this individual act, and therefore is to be placed altogether beyond anything actually done. Because the universal best ought to be carried out, nothing good is done. In point of fact, however, the nothingness of actual action and

the reality of the entire purpose alone, which are here upheld — these are on all hands again "shifted" or dissembled. The moral act is not something contingent and restricted; its essential nature lies in pure duty. This pure duty constitutes the sole entire purpose; and the act, whatever may be the limitation of the content, being the actualization of that purpose, is the accomplishment of the entire absolute purpose. Or, if again we take the reality in the sense of nature, which has laws of its own and stands over against pure duty, and take it in such a way that duty cannot realize its law within nature, then, since duty as such is the essential element, we are, when acting, not in fact concerned about the accomplishment of pure duty which is the whole purpose; for the accomplishment would then rather have as its end not pure duty, but the opposite, viz. reality. But there is again a "shifting" from the position that it is not reality with which we have to do. For by the very notion of moral action, pure duty is essentially an active consciousness. Action thus ought certainly to take place, absolute duty ought to be expressed in the whole of nature, and "moral law" to become "natural law".

If, then, we allow this highest good to stand for the essentially real, consciousness is altogether not in earnest with morality. For, in this highest good, nature has not a different law from what morality has. Moral action itself, in consequence, drops, for action takes place only under the assumption of a negative element which is to be cancelled by means of the act. But if nature conforms to the moral law, then assuredly this moral law would be violated by acting, by cancelling what already exists.

On that mode of interpretation, then, there has been admitted as the essential situation one which renders moral action superfluous and in which moral action does not take place at all. Hence the postulate of the harmony between morality and reality — a harmony posited by the very notion of moral action, which means bringing the two into agreement — finds on this

view, too, an expression which takes the form:— “because moral action is the absolute purpose, the absolute purpose is — that moral action do not take place at all”.

If we put these moments together, through which consciousness has moved in presenting its ideas of its moral life, we see that it cancels each one again in its opposite. It starts from the position that, *for it,* morality and reality do not make a harmony; but it is not in earnest with that, for in the moral act it is *conscious* of the presence of this harmony. But neither is it in earnest with this action, since the action is something individual; for it has such a high purpose, the highest good. This, however, is once more merely a dissemblance of the actual fact, for thereby all action and all morality would fall to the ground. In other words, it is not strictly in earnest with moral action; on the contrary, it really feels that, what is most to be wished for, the absolutely desirable, is that the highest good were carried out and moral action superfluous.

From this result consciousness must go on still further in its contradictory process, and must of necessity again dissemble the abolition of moral action. Morality is the inherently essential (*Ansich*); in order that it may have place, the final end of the world cannot be carried out; rather, the moral consciousness must exist for itself, and must find lying before it a nature opposing it. But it must *per se,* be completed. This leads to the second postulate of the harmony of itself and sensibility, the “nature” immediately within it. Moral self-consciousness sets up its purpose as pure purpose, as independent of inclinations and impulses, so that this bare purpose has abolished within itself the ends of sensibility. But this cancelling of the element of sense is no sooner set up than it is again dissembled. The moral consciousness acts, it brings its purpose into reality; and self-conscious sensibility, which should be done away with, is precisely the mediating element between pure consciousness and reality — is the

instrument used by the former for the realization of itself, or is the organ, and what is called impulse, inclinations. It is thus not really in earnest in cancelling inclinations and impulses, for these are just self-consciousness making itself actual. Moreover, they ought not to be suppressed, but merely to be in conformity with reason. They are, too, in conformity with it; for moral action is nothing else than self-realizing consciousness — consciousness taking on the form of an impulse, i.e. it is immediately the realized actually present harmony of impulse and morality. But, in point of fact, impulse is not only this empty conscious form, which might possibly have within itself a spring of action other than the impulse in question, and be driven on by that. For sensibility is a kind of nature, which contains within itself its own laws and springs of action: consequently, morality cannot seriously mean to be the inciting motive (*Triebfeder*) for impulses (*Triebe*), the angle of inclination for inclinations. For, since these latter have their own fixed character and peculiar content, the consciousness, to which *they* were to conform, would rather be in conformity with *them* — a conformity which moral self-consciousness declines to adopt. The harmony between the two is thus merely implicit and postulated.

In moral action the realized or present harmony of morality and sensibility was set up just now, and is now again "displaced". The harmony is in a misty distance beyond consciousness, where nothing can any more be accurately distinguished or grasped; for, to grasp this unity, which we have just tried to do, has proved impossible.

In this merely immanent or implicit harmony, however, consciousness gives up itself altogether. This immanent state is its moral completion, where the struggle of morality and sensibility has ceased, and the latter is in conformity to the former in a way which cannot be made out. On that account this completion is again merely a dissemblance of the actual case; for in point of fact morality would be really giving up itself in that

completion, because it is only consciousness of the absolute purpose *qua* pure purpose, i.e. in opposition to all other purposes. Morality is both the activity of this pure purpose, and at the same time the consciousness of rising above sensibility, of being mixed up with sensibility and of opposing and struggling with it. That this moral completion is not taken seriously is directly expressed by consciousness itself in the fact that it shifts this completion away into infinity, i.e. asserts that the completion is never completed.

Thus it is really only the middle state of being incomplete that is admitted to have any value: a state nevertheless which at least is supposed to be one of progress towards completion. Yet it cannot be so; for advancing in morality would really mean approaching its disappearance. For the goal would be the nothingness above mentioned, the abolition of morality and consciousness itself: but to come ever nearer and nearer to nothing means to decrease. Besides, "advancing" would, in general, in the same way as "decreasing," assume distinctions of quantity in morality: but these are quite inadmissible in such a sphere. In morality as the consciousness which takes the ethical end to be pure duty, we cannot think at all of difference, least of all of the superficial difference of quantity: there is only one virtue, only one pure duty, only one morality.

Since, then, it is not moral completion that is taken seriously, but rather the middle state, i.e. as just explained, the condition of no morality, we thus come by another way back to the content of the first postulate. For we cannot perceive how happiness is to be demanded for this moral consciousness on the ground of its worthiness to be happy. It is well aware of its not being complete, and cannot, therefore, in point of fact, demand happiness as a desert, as something of which it is worthy. It can ask happiness to be given merely as an act of free grace, i.e. it can only ask for happiness as such and as a substantive element by itself; it cannot expect it

except as the result of chance and caprice, not because there is any absolute reason of the above sort. The condition of non-morality herein expresses just what it is — that it is concerned, not about morality, but about happiness alone, without reference to morality.

By this second aspect of the moral point of view, the assertion of the first aspect, wherein disharmony between morality and happiness is presupposed, is also cancelled. One may pretend to have found by experience that in the actual present the man who is moral often fares badly, while the man who is not, often comes off happily. Yet the middle state of incomplete morality, the condition which has proved to be the essential one, shows clearly that this perception that morality fares badly, this supposed experience of it, is merely a dissemblance of the real facts of the case. For, since morality is not completed, i.e. since morality in point of fact is *not*, what can there be in the "experience" that morality fares badly?

Since, at the same time, it has turned out that the point at issue concerns happiness alone, it is manifest that, in making the criticism, "the man without morality comes off well," there was no intention to convey thereby that there is something wrong in such a case.. The designation of an individual as one devoid of morality necessarily falls to the ground, when morality in general is incomplete; such a characterization rests, indeed, on pure caprice. Hence the sense and content of that judgment of experience is simply this, that happiness as such should not have fallen to some who have got it, i.e. the judgment is an expression of envy, which covers itself up in the cloak of morality. The reason, however, why we think good luck, as we call it, should fall to the lot of others is good friendship, which ungrudgingly grants and wishes them, and wishes itself too, this favour, this accident of good fortune.

Morality, then, in the moral consciousness, is not completed. This is what is now established. But its essence consists in being only what is

complete, and so pure morality: incomplete morality is, therefore, impure in other words, is Immorality. Morality itself thus exists in another being than the actual concrete consciousness. This other is a *holy moral legislator.*

Morality which is not completed in consciousness the morality which is the reason for making those postulates, means, in the first instance, that morality, when it is set up as actual in consciousness, stands in relation to something else, to an existence, and thus itself acquires otherness or distinction, whence arises a manifold plurality of moral commands. The moral self-consciousness at the same time, however, looks on these many duties as unessential; for it is concerned with merely the one pure duty, and this plurality of duties, so far as they are determinate duties, has no true reality for self-consciousness. They can thus have their real truth only in another consciousness, and are (what they are not for the actual moral self-consciousness) sacred through a holy law-giver.

But this, too, is again merely a dissembling of the actual fact. For moral self-consciousness is to itself the absolute, and duty is simply and solely what it knows to be duty. It, however, knows only pure duty as duty: what is not sacred in its view is not *per se* sacred at all, and what is not *per se,* sacred cannot be rendered so by the being that is sacred. Moral consciousness, further, is not really serious in allowing something to be made sacred by another consciousness than its own. For, only that is without qualification sacred in its eyes which is made sacred through its own action, and is sacred within it. It is thus just as little in earnest in treating this other being as a holy being; for this would mean that, within that holy being something was to attain an essential significance, which, for the moral consciousness, i.e. in itself, has none.

If the sacred being was postulated, in order that duty might have binding validity within the moral consciousness, not *qua* pure duty, but as a plurality of specific duties, then this must again be dissembled and this other being

must be solely sacred in so far as only pure duty has binding validity within it. Pure duty has also, in point of fact, binding validity only in another being, not in the moral consciousness. Although, within the latter, pure morality seems alone to hold good, still this must be put in another form, for it is, at the same time, a natural consciousness. Morality is, in it, affected and conditioned by sensibility, and thus is not something substantial, but a contingent result of free will; in it, however, *qua* pure will, morality is a contingency of knowledge. Taken by itself, therefore, morality is in another being, is self-complete only in another reality than the actual moral consciousness.

This other being, then, is here absolutely complete morality, because in it morality does not stand in relation to nature and sensibility. Yet the reality of pure duty is its actualization in nature and sensibility. The moral consciousness accounts for its incompleteness by the fact that morality, in its case, has a positive relation to nature and sensibility, since it holds that an essential moment of morality is that morality should have simply and solely a negative relation towards nature and sensibility. The pure moral being, on the other hand, because far above the struggle with nature and sense, does not stand in a negative relation to them. Thus, in point of fact, the positive relation to them alone remains in *its* case, i.e. there remains just what a moment ago passed for the incomplete, for what was *not* moral. Pure morality, however, entirely cut off from actual reality so as likewise to be even without positive relation to reality, would be an unconscious unreal abstraction, where the very notion of morality, which consists in thinking of pure duty and in willing and doing, would be absolutely done away with. This other being, so purely and entirely moral, is again, therefore, mere dissemblance of the actual fact, and has to be given up.

In this purely moral being, however, the moments of the contradiction, in which this synthetic imaginative process is carried on, come closer together.

So, likewise, do the opposites taken up alternately, now this and *also* that, and *also* the other, opposites which are allowed to follow one after the other, the one being constantly supplanted by the other, without these ideas being brought together. So close do they come, that consciousness here has to give up its moral view of the world and retreat within itself.

It knows its morality as incomplete because it is affected by an opposing sensibility and nature, which partly perturb morality as such, and partly give rise to a plurality of duties, by which, in concrete cases of real action, consciousness finds itself embarrassed. For each case is the concrete focus of many moral relations, just as an object of perception in general is a thing with many qualities. And since the determinate duty is its purpose, it has a *content*; its content is a part of the purpose, and so morality is not pure morality. This latter, then, has its real existence in some other being. But such reality means nothing else than that morality is here self-complete, in itself and for itself — *for itself*, i.e. is morality of a consciousness: *in itself,* i.e. has existence and actuality.

In that first incomplete consciousness, morality is not realized and carried out. It is there something immanent and implicit, in the sense of a mere thought-entity; for it is associated with nature and sensibility, with the actuality of [external] existence and conscious life, which constitutes its content; and nature and sensibility are morally nothing. In the second, morality is present as completed, and not in the form of an unrealized thought-element. But this completion con- sists just in the fact that morality has reality in a consciousness, as well as free reality, objective existence in general, is not something empty, but filled out, full of content. That is to say, the completion of morality is placed in this, that what a moment ago was characterized as morally nothing is found present in morality and inherent in it. It is at one time to have validity simply and solely as the unrealized thought-element, a product of pure abstraction; but, on the other

hand, is just as certainly to have in this form no validity at all: its true nature is to consist in being opposed to reality, detached altogether therefrom, and empty, and then again to consist in being actual reality.

The syncretism, or fusion, of these contradictions, which is expressed *in extenso* in the moral attitude of experience, collapses internally, since the distinction on which it rests — viz. the conception of something which must be thought and posited as necessary, and is yet at the same time not essential — passes into one which does not any longer exist even in words. What, at the end, is affirmed to be something with different aspects, both to be nothing and also real, is one and the very same — existence and reality. And what is to be absolute only as something beyond actual existence and actual consciousness, and at the same time to be only in consciousness and so, *qua* beyond, nothing at all — this absolute is pure duty and the knowledge that pure duty is the essentially real. The consciousness, which makes this distinction that is no distinction, which announces actuality to be at once what is nothing and what is real, pronounces pure morality to be both the ultimate truth and also to be devoid of all true reality-such a consciousness expresses together in one and the same breath ideas which it formerly separated, and itself proclaims that it is not in earnest with this characterization and separation of the moments of self and inherent reality. It shows, on the contrary, that, what it announces as absolute existence apart from consciousness, it really keeps enclosed within the self of self-consciousness; and that, what it gives out as the absolute object of thought or absolutely inherent and implicit, it just for that reason takes to be something which has no truth at all.

It becomes clear to consciousness that placing these moments apart from each other is "*dis*-placing" them, is a dissemblance, and it would be *hypocrisy* were it really to keep to this. But, being pure moral self-consciousness, it flees from this discordance between its way of imagining

and what constitutes its essential nature, flees from this untruth, which gives out as true what it holds to be untrue, and, turning away with abhorrence, it hastens back into itself. The consciousness, which scorns such a moral idea of the world, is pure *Conscience* (*Gewissen*): it is, in its inmost being, simply spirit consciously assured or "certain" (*gewiss*) of itself, spirit which acts directly in the light of this assurance, which acts conscientiously (*gewissenhaft*), without the intervention of those ideas, and finds its true nature in this direct immediacy.

While, however, this sphere of dissemblance is nothing else than the development of moral self-consciousness in its various moments and is consequently its reality, so too this self-consciousness, by returning into itself, will become, in its inmost nature, nothing else. This returning into itself, indeed, simply means that it has come to be conscious that its truth is a pretended truth, a mere pretence. As returning into itself it would have to be always giving out this pretended truth as its real truth, for it would have to express and display itself as an objective idea; but it would know all the same that this is merely a dissemblance. It would consequently be, in point of fact, hypocrisy, and its abhorrence of such dissemblance would be itself the first expression of hypocrisy.

Conscience: The "Beautiful Soul": Evil and the Forgiveness of it

Translator's comments: The one-sidedness of each of the preceding stages is removed when the moral consciousness assumes the attitude of Conscience. Here the individual is at once self-legislating and yet sure of the unity and self completeness of its own will in the midst of all diversity of moral content. The immediacy involved in the idea of a "self-legislating" will appears in the perceptual directness of the action of conscience: it "sees" what is right and does the right without hesitation. But it is not an abstract "faculty" of willing independent of the varied content of the

individual's moral experience. The universality of the individual permeates and pervades all the content of his being and makes him a concrete moral individuality, at home with himself in the smallest detail as well as in the larger issues of his self-complete spiritual existence. Conscience, as Butler says, is a "system" or "constitution", analogous in the case of the individual to the objectified system of the state and its institutions. The self-deception of the second one-sided phase of moral experience seems also to have no place in Conscience, for Conscience is the transparent and self-revealing unity in all the content of moral individuality. Only on this condition can it be absolutely confident and certain of itself in all its functions, and this certainty of itself is the inalienable characteristic of conscience. It thinks it cannot be deceived about itself, can neither delude itself nor others, but freely realizes all that it professes to be and professes to be all that it realizes, It is thus the supreme achievement of finite spiritual existence; but it has no meaning apart from the existence of finite spirit in the form of society.

Its very conditions, however, give rise to delusion and deception of another kind. For, so complete is its world and its life, that it may attempt to cut itself off from the concrete substance of actual society which alone makes possible the existence of conscience. It then tries to cultivate goodness in solitary isolation from the actual social whole. This is the attitude of the "beautiful soul", a type of spiritual life cultivated by the "Moravians", and familiar during the Romantic movement. Novalis is the best-known example; the classical interpretation of the mood was given in Goethe's *Meister's Lehrjahre,* Bk. 6. It has the self-confidence and individual inspiration of Conscience, but frankly rejects the concrete objectivity which secures for Conscience liberation from mere subjectivity. The very rejection of objectivity is the only achievement of the "beautiful soul", and is held to be the greatest triumph of its self-conscious freedom. It

flees from concrete moral action, and luxuriates in a state of self-hypnotized inactivity. Still it takes up this attitude in the interests of “pure goodness”, and hence in withdrawing from the lowly deeds of the daily moral life it indulges all the more in the self-cloistered cult of the beauty of holiness. It is moral individualism turned into mystic self-absorption. Hegel’s analysis brings out that this type of spirit is in principle as it was in fact the direct ally of moral evil. For its refusal to act means indifference to all action, good and bad alike, and the rejection of the demands of duty is precisely immorality; (,2) its self-closed isolation destroys the very principle of true morality, universality of will, recognition and acknowledgment by others of the claims of the individual will.

But this extremity of finite spiritual experience is the opportunity of Absolute Spirit. The attitude of this mystical moral individuality is indirectly an indication of the finittude of the moral point of view and therefore of its failure to supply the absolute self-completeness which spirit requires. The very consciousness by finite spirit of its inherent incompleteness is implicitly a consciousness of the Absolute Spirit. The consciousness of Absolute Spirit is the attitude of experience known as Religion.

Conscience: The “Beautiful Soul”; Evil and the Forgiveness of it

The antinomy in the moral view of the world — viz. that there is a moral consciousness and that there is none, or that the validity, the bindingness of duty has its ground beyond consciousness, and conversely *only* takes effect *in* consciousness — these contradictory elements had been combined in the idea, in which the non-moral consciousness is to pass for moral, its contingent knowledge and will to be accepted as fully sufficing, and happiness to be its lot as a matter of grace. Moral self consciousness took

this self-contradictory idea not upon itself, but transferred it to another being. But this putting outside itself of what it must think as necessary is as much a contradiction in form as the other was in content. But that which appears as contradictory, and that in the division and resolution of which lies the round of activity peculiar to the moral attitude, are inherently the same: for pure duty *qua* pure knowledge is nothing else than the self of consciousness, and the self of consciousness is existence and actuality; and, in the same way, what is to be beyond actual consciousness is nothing else than pure thought, is, in fact, the self. Because this is so, self-consciousness, for us or *per se*, passes back into itself, and becomes aware that that being is its self, in which the actual is at once pure knowledge and pure duty. It takes itself to be absolutely valid in its contingency, to be that which knows its immediate individual being as pure knowledge and action, as the true objective reality and harmony.

This self of Conscience, the mode of spirit immediately certain of itself as absolute truth and objective being, is the third type of spiritual self. It is the outcome of the third sphere of the spiritual world, and may be shortly compared with the two former types of self.

The totality or actuality which is revealed as the truth of the ethical world, the world of the social order, is the self of a Person [the legal self]: its existence lies in being recognized and acknowledged. As the person is the self devoid of substance, this its existence is abstract reality too. The person has a definite standing, and that directly and immediately: its self is the point in the sphere of its existence which is immediately at rest. That point is not torn away from its universality; the two [the particular focus and its universality] are therefore not in a relational process with regard to one another: the universal is in it without distinction, and is neither the content of the self, nor is the self filled by itself.

The second self is the truth and outcome of the world of culture, is spirit that has recovered itself after and through disruption, is absolute freedom. In this self, the former immediate unity of individual existence and universality breaks up into its component elements. The universal, which remains at the same time a purely spiritual entity, the state of recognition or universal will and universal knowledge — the universal is object and content of the self, and its universal actuality. But the universal has not there the form of existence detached from the self: in this mode of self it therefore gets no filling, no positive content, no world.

Moral self-consciousness, indeed, lets its universal aspect get detached, so that this aspect becomes a nature of its own; and at the same time it retains this universality within itself in a superseded form. But it is merely a game of dissembling; it constantly interchanges these two characteristics. In the form of Conscience, with its certainty of itself, it first finds the content to fill the former emptiness of duty as well as the emptiness of right and the empty universal will. And because this certainty of self is at the same time immediacy, it finds in conscience definite existence.

Having reached this level of its truth, moral self-consciousness then leaves, or rather supersedes, this state of internal division and self-separation, whence arose "dissemblance" — the separation of its inherent being from the self, of pure duty, *qua* pure purpose, from reality *qua* a nature and a sensibility opposed to pure purpose. It is, when thus returned into itself, concrete moral spirit, which does not make for itself a bare abstract standard out of the consciousness of pure duty, a standard to be set up against actual conscious life; on the contrary, pure duty, as also the sensuous nature opposed to pure duty, are superseded moments. This mode of spirit, in its immediate unity, is a moral being making itself actual, and an act is immediately a concrete embodiment of morality.

Given a case of action; it is an objective reality for the knowing mind. The latter, *qua* conscience, knows it in a direct concrete manner; and at the same time it is merely as conscience knows it to be. When knowledge is something other than its object, it is contingent in character. Spirit, however, which is sure of its self, is no longer an accidental knowledge of that kind, is not a way of producing inside its own being ideas from which reality is divorced. On the contrary; since the separation between what is essential and self has been given up, a case of moral action falls, just as it is essentially, directly within immediate conscious certainty, the sensible [feeling] form of knowledge, and it is essentially only as it is in this form of knowledge.

Action, then, *qua* realization, is in this way the pure form of will — the bare conversion of reality in the sense of a given case, into a reality that is enacted, the conversion of the bare state of objective knowledge into one of knowledge about reality as something produced and brought about by consciousness. Just as sensuous certainty is directly taken up, or rather converted, into the essential life and substance of spirit, this other transformation is also simple and unmediated, a transition made through the pure conception without changing the content, the content being conditioned by some interest on the part of the consciousness knowing it.

Further conscience does not break up the circumstances of the case into a variety of duties. It does not operate as the positive general medium, in which the manifold duties, each for itself, would acquire immovable substantial existence. If it did so, *either* no action could take place at all, because each concrete case involves opposition in general, and, in the specific case of morality, opposition of duties — and hence there would always be one side injured, one duty violated, by the very nature of concrete action: *or* else, if action does take place, the violation of one of the conflicting duties would be the actual result brought about. Conscience is

rather the negative single unity, it is the absolute self, which does away with this variety of substantial moral constituents. It is simple action in accordance with duty, action which does not fulfil this or that duty, but knows and does what is concretely right. It is, therefore, in general, and for the first time in moral experience, moral action as action, and into this the previous stage of mere consciousness of morality without action has passed.

The concrete shape which the act takes may be analysed by a conscious process of distinction into a variety of properties, i.e. in this case into a variety of moral relationships; and these may either be each expressly held to be absolute (as each must be if it is to be duty) or, again, subjected to comparison and criticism. In the simple moral action arising from conscience, duties are so piled and commingled that the isolated independence of all these separate entities is immediately destroyed, and the process of critically considering and worrying about what our duty is finds no place at all in the unshaken certainty of conscience.

Just as little, again, do we find in conscience that fluctuating uncertainty of mind, which puts now so-called "pure" morality away from itself, assigning it to some other holy being, and takes itself to be unholy, and then again, on the other hand, puts this moral purity within itself, and places in that other the connexion of the sensuous with the moral element.

It renounces all these semblances and dissemblances (*Stellungen und Verstellungen*) characteristic of the moral point of view, when it gives up thinking that there is a contradiction between duty and actual reality. According to this latter state of mind, I act morally when I am conscious of performing merely pure duty and nothing else but that: i.e. in fact, when I do *not* act. When, however, I really act, I am conscious of an "other", of a reality which is there before me, and one which I want to bring about; I have a definite end and fulfil a definite duty. There is something else therein than the pure duty, which alone was supposed to be kept in view.

Conscience, on the other hand, is the sense that, when the moral consciousness declares pure duty to be the essence of its action, this pure purpose is a dissemblance of the actual fact. For the real fact is that pure duty consists in the empty abstraction of pure thought, and finds its reality and content solely in some definite actual existence, an actuality which is actuality of consciousness itself — not of consciousness in the sense of a thought-entity, but as an individual. Conscience for its own part, finds its truth to lie in the direct certainty of itself. This immediate concrete certainty of itself is the real essence. Looking at this certainty from the point of view of the opposition which consciousness involves, the agent's own immediate individuality constitutes the content of moral action; and the form of moral action is just this very self as a pure process, viz. as the process of knowing, in other words, is private individual conviction.

Looking more closely at the unity and the significance of the moments of this stage, we find that moral consciousness conceived itself merely in the form of the inherent principle, or as ultimate essence; *qua* conscience, however, it lays hold of its explicit individual self-existence (*Fürsichseyn*), or its self. The contradiction involved in the moral point of view is resolved, i.e. the distinction, which lay at the basis of its peculiar attitude, proves to be no distinction, and melts into the process of pure negativity. This process of negativity is, however, just the self: a single simple self which is at once pure knowledge and knowledge of itself as this individual conscious life. This self constitutes, therefore, the content of what formerly was the empty essence; for it is something actual and concrete, which no longer has the significance of being a nature alien to the ultimate essence, a nature independent and with laws of its own. As the negative element, it introduces distinction into the pure essence, a definite content, and one, too, which has a value in its own right as it stands.

Further, this self is, *qua* pure self-identical knowledge, the universal without qualification, so that just this knowledge, being its very own knowledge, being conviction, constitutes *duty*. Duty is no longer the universal appearing over against and opposed to the self; duty is known to have in this condition of separation no validity. It is now the law which exists for the sake of the self, and not the law for the sake of which the self exists. The law and duty, however, have for that reason not only the significance of existing on their own account, but also of being inherent and essential; for this knowledge is, in virtue of its identity with itself, just what is inherently essential. This inherent being gets also separated in consciousness from that direct and immediate unity with self-existence: so contrasted and opposed, it is objective being, it is being for something else.

Duty itself now, *qua* duty deserted by the self, is known to be merely a moment; it has ceased to mean absolute being, it has become degraded to something which is not a self, does not exist on its own account, and is thus what exists for something else. But this existing-for-something-else remains an essential moment just for the reason that self, *qua* consciousness, constitutes and establishes the opposition between existence-for-self and existence-for-another; and now duty essentially means something immediately actual, and is no longer a mere abstract pure consciousness.

This existence for something else is, then, the inherently essential substance distinguished from the self. Conscience has not given up pure duty, the abstract implicit essence: pure duty is the essential moment of relating itself, *qua* universality, to others. Conscience is the common element of distinct self-consciousnesses; and this is the substance in which the act secures subsistence and reality, the moment of being recognized by others. The moral self-consciousness does not possess this moment of recognition, of pure consciousness which has definite existence; and on that account really does not "act" at all, does not effectually actualize anything.

Its inherent nature is for it either the abstract unreal essence, or else existence in the form of a reality which has no spiritual character. The actual reality of conscience, however, is one which is a self, i.e. an existence conscious of itself, the spiritual element of being recognized. Doing something is, therefore, merely the translation of its individual content into that objective element where it is universal and is recognized, and this very fact, that the content is recognized, makes the deed an actuality. The action is recognized and thereby real, because the actual reality is immediately bound up with conviction or knowledge; or, in other words, knowledge of one's purpose is immediately and at once the element of existence, is universal recognition. For the essence of the act, duty, consists in the conviction conscience has about it. This conviction is just the inherent principle itself; it is inherently universal self-consciousness — in other words, is recognition and hence reality. The result achieved under conviction of duty is therefore directly one which has substantial solid existence. Thus, we hear nothing more there about good intention not coming to anything definite, or about the good man faring badly. What is known as duty is carried out completely and becomes an actual fact, just because what is dutiful is the universal for all self-consciousnesses, that which is recognized, acknowledged, and thus objectively *is*. Taken separately and alone, however, without the content of self, this duty is existence-for-another, the transparent element, which has merely the significance of an unsubstantial essential factor in general.

If we look back on the sphere where spiritual reality first made its appearance, we find that the principle involved was that the utterance of individuality is the absolutely real, the ultimately substantial. But the shape which, in the first instance, gave expression to this principle, was the "honest consciousness" which was occupied and concerned with abstract "fact itself". This "fact itself" was there a predicate. In conscience,

however, it is for the first time a Subject, which has affirmed within it all aspects of consciousness, and for which all these moments, substantiality in general, external existence, and essence of thought, are contained in this certainty of itself. The "fact itself" has substantiality in general in the ethical order (*Sittlichkeit*), external existence in culture, self -knowing essence of thought in morality; and in conscience it is the Subject, which knows these moments within itself. While the "honest consciousness" is for ever grasping merely the bare and empty "fact itself", conscience, on the other hand, secures the "fact itself " in its fullness, a fullness which conscience of itself supplies. Conscience has this power through its knowing the moments of consciousness as moments, and controlling them because it is their negative essential principle.

When conscience is considered in relation to the single features of the opposition which appears in action, and when we consider its consciousness regarding the nature of those features, its attitude towards the reality of the situation where action has to take place is, in the first instance, that of knowledge. So far as the aspect of universality is present in such knowledge, it is the business of conscientious action *qua* knowledge, to compass the reality before it in an unrestricted exhaustive manner, and thus to know exactly the circumstances of the case, and give them due consideration. This knowledge, however, since it is aware of universality as a moment, is in consequence a kind of knowledge of these circumstances which is conscious all the while of not embracing them, is conscious of not being conscientious in its procedure. The genuinely universal and pure relation of knowledge would be one towards something not opposed, a relation to itself. But action through the opposition essentially implied in action is related to what negates consciousness, to a reality existing *per se.* This reality — being, as contrasted with the simple nature of pure consciousness, the absolute other, multiplicity *per se* — is a sheer plurality

of circumstances which breaks up indefinitely and spreads in all directions — backwards into their conditions, sidewards in their associations, forwards in their consequences.

The conscientious mind is aware of this nature, of "the fact" and of its relation thereto, and knows it is not acquainted to the full and complete extent require with the situation in which its action takes place, and knows that its pretence of conscientiously weighing and considering *all* the circumstances is futile. This acquaintance with and consideration of all the circumstances, however, are not entirely absent: but they are merely present as a moment, as something which is only for others: and the conscientious mind holds its *incomplete* knowledge to be sufficient and complete, *because* it is its *own* knowledge.

In a similar way the process is constituted in connexion with the universality of the essential principle, that is, with the characterization of the content as determined through pure consciousness. Conscience, when it goes on to act, takes up a relation to the various sides of the case. The case breaks up into separate elements, and the relation of pure consciousness towards it does the same: whereby the multiplicity characteristic of the case becomes a multiplicity of duties. Conscience knows that it has to select and decide amongst them; for none of them specifically, in its content, is an absolute duty; only pure duty is so. But this abstract entity has, in its realization, come to denote self-conscious ego. Spirit certain of itself is at rest within itself in the form of conscience, and its real universality, its duty, lies in its pure conviction concerning duty. This pure conviction as such is as empty as pure duty, pure in the sense that nothing within it, no definite content, is duty. Action, however, has to take place, the individual must determine to do something or other; and spirit which is certain of itself, in which the inherent principle has attained the significance of self-conscious ego, knows it has this determination, this specific content, in the immediate

certainty of its own self. This certainty, being a determination and a content, is “natural” consciousness, i.e. the various impulses and inclinations.

Conscience admits no content as absolute for it, because it is absolute negativity of all that is definite. It determines from itself alone. The circle of the self, however, within which determinateness as such falls, is so-called “sensibility”: in order to get a content out of the immediate certainty of self, there is no other element to be found except sensibility.

Everything that in previous modes of experience was presented as good or bad, law and right, is something other than immediate certainty of self; it is a universal, which is now a relative entity, an existence-for-another. Or, looked at otherwise, it is an object which, while connecting and relating consciousness with itself, comes between consciousness and its own propel truth, and instead of that object being the immediacy of consciousness, it rather cuts consciousness off from itself.

For conscience, however, certainty of self is the pure, direct, and immediate truth: and this truth is thus its immediate certainty of self presented as content; i.e. its truth is altogether the caprice of the individual, and the accidental content of his unconscious natural existence [his sensibility].

This content at the same time passes for essential moral reality, for duty. For pure duty, as was found when testing and examining laws, is utterly indifferent to every content, and gets along with any. Here it has at the same time the essential form of self-existence, of existing on its own account: and this form of individual conviction is nothing else than the sense of the emptiness Of pure duty, and the consciousness that this is merely a moment, that its substantiality is a predicate which finds its subject in the individual, whose caprice gives pure duty content, can connect every content with this form, and attach its feeling of conscientiousness to any content.

An individual increases his property in a certain way. It is a duty that each should see to the maintenance of himself and family, and no less ensure the possibility of his being serviceable to his neighbours and of doing good to those standing in need. The individual is aware that this is a duty, for this content is directly contained in the certainty he has of himself. He perceives, further, that he fulfils this particular duty in this particular case. Other people possibly consider the specific way he adopts as fraud: they hold by other sides of the concrete case presented, while he holds firmly to this particular side of it by the fact of his being conscious that the increase of property is a pure and absolute duty.

In the same way there is fulfilled by the individual, as a duty, what other people call violence and wrong-doing — the duty of asserting one's independence against others: and, again, the duty of preserving one's life, and the possibility of being useful to one's neighbours. Others call this cowardice, but what they call courage really violates both these duties. But cowardice must not be so stupid and clumsy as not to know that the maintenance of life and the possibility of being useful to others are duties — so inept as not to be convinced of the dutifulness of its action, and not to know that dutifulness consists in knowledge. Otherwise it would commit the stupidity of being immoral. Since morality lies in the consciousness of having fulfilled one's duty, this will not be lacking when the action is what is called cowardice any more than when it is what is called courage. As the abstraction called "duty" is capable of every content, it is quite equal to that of cowardice. The agent knows what he does to be duty, and since he knows this, and conviction as to duty is just dutifulness, he is thus recognized and acknowledged by others. The act thereby becomes accepted as valid and has actual existence.

It is of no avail to object to this freedom — which puts any and every kind of content into this universal inert receptacle of pure duty and pure

knowledge — by asserting that another content ought to have been put there. For whatever the content be, each content has upon it the stain of determinateness from which pure knowledge is free, which pure knowledge can despise just as readily as it can take up every determinateness in turn. Every content, through its being determinate, stands on the same footing with every other, even though it seems to have precisely the character that the particularity in the content is cancelled. It may well seem — since in concrete cases duty breaks regularly into opposition, and, by doing so, sunders the opposites individuality and universality — that the duty, whose content is the universal as such, contains on that account, *ipso facto,* the nature of pure duty, and that thus form and content are here entirely in accord. On this view, it might seem that, e.g. acting for the universal good, for what is the best for all, is to be preferred to acting for what is the best for the individual. But this universal duty is precisely what is present as self-contained actual substance, in the form of [established] law and right, and holds good independently of the individual's knowledge and conviction as well as of his immediate interest. It is thus precisely that against the form of which morality as a whole is directed. As regards its content, however, this too is determinate in character, in so far as the "universally best" is opposed to the "individual best". Consequently, its law is one from which conscience knows itself to be absolutely free, and it gives itself the absolute privilege to add and pare, to neglect as well as fulfil it.

Then, again, the above distinction of duty towards the individual and duty towards the universal is not something fixed and final, when we look at the nature of the opposition in question. On the contrary, what the individual does for himself is to the advantage of the universal as well. The more he looks after his own good, not only is there the greater *possibility* of his usefulness to others: his very reality consists merely in his living and existing in connexion with others. His individual enjoyment means

ultimately and essentially putting what is his own at the disposal of others, and helping them to secure *their* enjoyment. In fulfilling duty to individuals, and hence duty to self, duty to the general thus also gets fulfilled. Weighing, considering, comparing duties, should this appear here, would take the line of calculating the advantage which the general would get from any given action. But there can be no such process; partly because morality would thereby be handed over to the inevitable contingency characteristic of mere "insight"; partly because it is precisely the nature of conscience to have done with all this calculating and weighing of duties, and to decide directly from itself without any such reasons.

In this way, then, conscience acts and maintains itself in the unity of its essential being and its objective existence for itself, in the unity of pure thought and individuality: it is spirit certain of itself, which inherently possesses its own truth, within itself, in its knowledge, a knowledge in the sense of knowledge of its duty. It maintains its being therein by the fact that the positive element in the act, the content as well as form of duty and the knowledge of duty, belong to the self, to the certainty of itself. What, however, seeks to come before the self with an inherent being of its own is held to be not truly real, merely a transcended element, only a moment. Consequently, it is not universal knowledge in general that has a value, but what is known of the circumstances. It puts into duty, which is the universal immanent essence, the content which it derives from its natural individuality; for the content is one that is present in its own being. This content, in virtue of the universal medium wherein it exists, becomes the duty which it carries out, and empty pure duty is, through this very fact, affirmed to be something transcended, a moment. This content is its emptiness, transcended and cancelled, i.e. is the fulfilling of pure duty.

But at the same time conscience is detached from every possible content. It absolves itself from every specific duty, which would try to pass for a

law. In the strength of its certainty of itself, it has the majesty of absolute self-sufficiency, of absolute *a rpkla* to bind or to loose. This self-determination is at once, therefore, absolute conformity to duty. Duty is the knowledge itself; this pure and simple selfhood, however, is the immanent principle and essence; for this inherent principle is pure self-identity, and self-identity lies in this consciousness.

This pure knowledge is immediately objective, is existence-for-another; for, *qua* pure self-identity, it is immediacy, it is objective being. This being, however, is at the same time pure universality, the selfhood of all: in other words, action is acknowledged, and hence actual. This being forms the element by which conscience directly stands on a footing of equality with every self-consciousness; and this relation means not an abstract impersonal law, but the self of conscience.

In that this right which conscience does is at the same time, however, a fact for others, a disparity seems to affect conscience. The duty which it fulfils is a determinate content; that content is, no doubt, the self of consciousness, and so its knowledge of itself, its identity with its self. But when fulfilled, when planted in the general element of existence, this identity is no longer knowledge, no longer this process of distinction which directly and at the same time does away with its distinctions. Rather, in the sphere of existence, the distinction is set up as subsistent, and the act is a determinate specific one, not identical with the element of everybody's self-consciousness, and hence *not* necessarily acknowledged and recognized. Both aspects, conscience *qua* acting, and the general consciousness acknowledging this act to be duty, stand equally loose from the specific character belonging to this deed. On account of this freedom and detachment, the relation of the two within the common medium of their connexion is rather a relationship of complete disparity — as a result of which, the consciousness, which is aware of the act, finds itself in complete

uncertainty regarding the spirit which does the act and is "certain of itself". This spirit acts and places in existence a determinate characteristic; others hold to this existence, as its truth, and are therein certain of this spirit; it has therein expressed *what* it takes to be its duty. But it is detached and free from any specific duty; it has, therefore, left the point where other people think it actually to be; and this very medium of existence and duty as inherently existing are held by it to be merely transitory moments. What it thus places before them, it also "displaces" again, or rather has, *eo ipso,* immediately "displaced". For its reality is, for it, not the duty and determinate content thus put forward, but rather is the reality which it has in its absolute certainty of itself.

The other self-consciousnesses do not know, then, whether this particular conscience is morally good or is wicked; or, rather, not merely can they not know this conscience, but they must take it to be also wicked. For just as it stands loose to the determinate content of duty, and detached from duty as inherently existing, so do they likewise. What it places before them, they themselves know how to "displace" or dissemble: it is something expressing merely the self of another individual, not their own: they do not merely know themselves to be detached and free from it, but have to resolve and analyse it within their own consciousness, reduce it to nothingness by judgments and explanations in order to preserve their own self.

But the act of conscience is not merely this determination of existence, a determinate content forsaken by the pure self. What is to be binding and to be recognized as duty, only is so through knowledge and conviction as to its being duty, by knowledge of self in the deed done. When the deed ceases to have this self in it, it ceases to be what is alone its essential nature. Its existence, if deserted by this consciousness of self, would be an ordinary reality, and the act would appear to us a way of fulfilling one's pleasure and desire. What ought to exist has here essentiality only by its being known to

be individuality giving itself expression. And its being thus known is what is acknowledged and recognized by others, and is that which as such ought to have existence.

The self enters existence as self. The spirit which is certain of itself exists as such for others; its immediate act is not what is valid and real; what is acknowledged by others is, not the determinate element, not the inherent being, but solely and simply the self knowing itself as such. The element which gives permanence and stability is universal self-consciousness. What enters this element cannot be the effect of the act: the latter does not last there, and acquires no permanence: only self-consciousness is what is recognized and gains concrete reality.

Here again, then, we see Language to be the form in which spirit finds existence. Language is self-consciousness existing *for others;* it is self-consciousness which as such is there immediately present, and which in its individuality is universal. Language is self separating itself from itself, which as the pure ego identical with ego becomes an object to itself, which at once maintains itself in this objective form as *this* actual self, and at the same time fuses directly with others and is *their* self-consciousness. The self perceives itself at the same time that it is perceived by others: and this perceiving is just existence which has become a self.

The content, which language has here obtained, is no longer the self we found in the world of culture, perverted, perverting, and distraught. It is spirit which, having returned to itself, is certain of itself, certain in itself of its truth, or of its own act of recognition, and which is recognized as this knowledge. The language of the ethical spirit of society is law, and simple command and complaint, which is but a tear shed over necessity. Moral consciousness, on the other hand, remains dumb, shut up within its inner life; for self has no existence as yet in its case: rather existence and self there stand as yet only in external relation to each other. Language,

however, comes forward merely as the mediating element only between self-consciousnesses independent and recognized; and the existent self means immediately universal recognition, means manifold recognition and in this very manifoldness simple recognition. What the language of conscience contains is the self knowing itself as essential reality. This alone is what that language expresses, and this expression is the true realization of "doing", of action, and is the validation of the act. Consciousness expresses its conviction: in this conviction alone is the action duty: it holds good as duty, too, solely by the conviction being *expressed.* For universal self-consciousness stands detached from the specific act which merely exists: the act *qua* existence means nothing to it: what it holds of importance is the *conviction* that the act is a duty; and this appears concretely in language.

To realize the act means here not translating its content from the form of purpose, or self-existence, into the form of abstract reality: it means translating it from the form of immediate certainty of self, which takes its knowledge, its self-existence, to be the essential fact, into the form of the assurance that consciousness is convinced of its duty, and, being conscience, knows of itself what duty is. This assurance thus guarantees that consciousness is convinced of its conviction being the essential fact.

Whether the assurance, that it acts from conviction of duty, is true, whether it really is *duty* which is done — these questions or doubts have no meaning as directed against conscience. In the case of the question, whether the assurance is true, it would be assumed that the inner attention is different from the one put forward, i.e. that the willing of the individual self can be separated from duty, from the will of the universal and pure consciousness: the latter will would in that case be a matter of words, while the former would be strictly the real moving principle of the act. But such a distinction between the universal consciousness and the individual self is precisely what has been cancelled, and the superseding of it constitutes

conscience. Immediate knowledge on the part of self which is certain of itself is law and duty. Its intention, by being its own intention, is what is right. All that is required is that it should know this, and state its conviction that its knowledge and will are the right. The expression of this assurance *ipso facto* cancels the form of its particularity. It recognizes thereby the necessary universality of the self. In that it calls itself conscience, it calls itself pure self-knowledge and pure abstract will, i.e. it calls itself a universal knowledge and will which acknowledges and recognizes others, is like them — for they are just this pure self-knowledge and will — and which is on that account also recognized by *them*. In the willing of the self which is certain of itself, in this knowledge of the self as the essential reality, lies the essence of the right.

When any one says, therefore, he is acting from conscience, he is saying what is true, for his conscience is the self which knows and wills. But it is essential he should *say* so, for this self has to be at the same time universal self. It is not universal in the content of the act: for this content is *per se* indifferent on account of its being specific and determinate. The universality lies in the form of the act. It is this form which is to be affirmed as real: the form is the self, which as such is actual in language, pronounces itself to be the truth, and just by so doing acknowledges all other selves, and is recognized by them.

Conscience, then, in its majestic sublimity above any specific law and every content of duty, puts whatever content it pleases into its knowledge and willing. It is moral genius and originality, which knows the inner voice of its immediate knowledge to be a voice divine; and since in such knowledge it directly knows existence as well, it is divine creative power, which contains living force in its very conception. It is in itself, too, divine worship, "service of God", for its action is the contemplation of this its own proper divinity.

This solitary worship, this “service of God” in solitude of soul, is at the same time essentially “service of God” on the art of a religious community; and pure inward self-knowledge and perception of self pass to being a moment of consciousness. Contemplation of itself is its objective existence, and this objective element is the utterance of its knowledge and will as a universal. Through such expression the self becomes established and accepted, and the act becomes an effective deed, a deed carrying out a definite result. What gives reality and subsistence to its deed is universal self-consciousness. When, however, conscience finds expression, this puts the certainty of itself in the form of pure self and thereby as universal self. Others let the act hold as valid, owing to the explicit terms in which the self is thus expressed and acknowledged to be the essential reality. The spirit and the substance of their community are, thus, the mutual assurance of their conscientiousness, of their good intentions, the rejoicing over this reciprocal purity of purpose, the quickening and refreshment received from the glorious privilege of knowing and of expressing, of fostering and cherishing, a state so altogether admirable.

So far as this sphere of conscience still distinguishes its abstract consciousness from its self-consciousness, its life is merely hid in God. God is indeed immediately present to its mind and heart, to its self. But what is revealed, its actual consciousness and the mediating process of this consciousness, is, to it, something other than that hidden inner life and the immediacy of God’s presence. But, with the completion of conscience, the distinction between its abstract consciousness and its self-consciousness is done away. It knows that the abstract consciousness is just this self, this individual self-existence which is certain of itself: that the very difference between the terms is abolished in the *immediateness* of the relation of the self to the ultimate Being, which, when placed outside the self, is the abstract essence, and a Being concealed from it. For a relation is mediate

when the terms related are not one and the same, but each is a different term for the other, and is one only with the other in some third term: an *immediate* relation, however, means, in fact, nothing else than the unity of the terms. Having risen above the meaningless position of holding these distinctions, which are not distinctions at all, to be still such, consciousness knows the immediateness of the presence of ultimate Being within it to be the unity of that Being and its self: it thus knows itself to be the living inherent reality, and knows its knowledge to be Religion, which, *qua* knowledge viewed as an object or knowledge with an objective existence, is the utterance of the religious communion regarding its own spirit.

We see then, here, self-consciousness withdrawn into the inmost retreats of its being, with all externality, as such, gone and vanished from it — returned into the intuition of ego as altogether identical with ego, an intuition where this ego is all that is essential, and all that exists. It is swamped in this conception of itself; for it has been driven to the extreme limit of its extreme positions, and in such a way that the moments distinguished, moments through which it is real or still consciousness, are not merely *for us* these bare extremes; rather what it is for itself, and what, to it, is inherent, and what is, for it, existence — all these moments have evaporated into abstractions. They have no longer stability, no substantial existence for this consciousness itself. Everything, that was hitherto for consciousness essential, has reverted into these abstractions. When clarified to this degree of transparency, consciousness exists in its poorest form, and the poverty, constituting its sole and only possession, is itself a process of disappearance. This absolute *certainty* into which the substance has been resolved is absolute *untruth*, which collapses within itself; it is absolute self-consciousness, in which consciousness [with its relation of self and object] is submerged and goes under.

Looking at this submergence and disappearance from within, the inherent and essential substance is, for consciousness,, knowledge in the sense of *its* knowledge. Being consciousness, it is split up into the opposition between itself and the object, which is, for it, the essentially real. But this very object is what is perfectly transparent, is its self; and its consciousness is merely knowledge of itself. All life and all spiritual truth have returned into this self, and have lost their difference from the ego. The moments of consciousness are therefore these extreme abstractions, of which none holds its ground, but each loses itself in the other and produces it. We have here the process of the "unhappy soul", in restless change with self; in the present case, however, this is a conscious experience going on inside itself, fully conscious of being the notion of reason, while the "unhappy soul" above spoken of was only reason implicitly. The absolute certainty of self thus finds itself, *qua* consciousness, converted directly into a dying sound, a mere objectification of its subjectivity or self-existence. But this world so created is the utterance of its own voice, which in like manner it has directly heard, and only the echo of which returns to it. This return does not therefore mean that the self is there in its true reality (*an und für sich*): for the real is, for it, not an inherent being, is no *per se,* but its very self. Just as little has consciousness itself existence, for the objective aspect does not succeed in becoming something negative of the actual self, in the same way as this self does not reach complete actuality. It lacks force to externalize itself, the power to make itself a thing, and endure existence. It lives in dread of staining the radiance of its inner being by action and existence. And to preserve the purity of its heart, it flees from contact with actuality, and steadfastly perseveres in a state of self-willed impotence to renounce a self which is pared away to the last point of abstraction, and to give itself substantial existence, or, in other words, to transform its thought into being, and commit itself to absolute distinction [that between thought

and being]. The hollow object, which it produces, now fills it, therefore, with the feeling of emptiness. Its activity consists in yearning, which merely loses itself in becoming an unsubstantial shadowy object, and, rising above this loss and falling back on itself, finds itself merely as lost. In this transparent purity of its moments it becomes a sorrow-laden "beautiful soul", as it is called; its light dims and dies within it, and it vanishes as a shapeless vapour dissolving into thin air.

This silent fusion of the pithless unsubstantial elements of evaporated life has, however, still to be taken in the other sense of the reality of conscience, and in the way its process actually appears. Conscience has to be considered as *acting*. The objective moment in this phase of consciousness took above the determinate form of universal consciousness. The knowing of self is, *qua this* particular self, different from the other self. Language in which all reciprocally recognize and acknowledge each other as acting conscientiously — this general equality breaks up into the inequality of each individual existing for himself; each consciousness is just as much reflected out of its universality absolutely into itself as it is universal. By this means there necessarily comes about the opposition of individuality to other individuals and to the universal. And this relation and its process we have to consider.

Or, again, this universality and duty have the absolutely opposite significance; they signify determinate individuality, exempting itself from what is universal, individuality which looks on pure duty as universality that has appeared merely on the surface and is turned outwards: "duty is merely a matter of words", and passes for that whose being is for something else. Conscience, which in the first instance takes up merely a negative attitude towards duty, *qua* a given determinate duty, knows itself detached from it. But since conscience fills empty duty with a determinate content drawn from its own self, it is positively aware of the fact that it, *qua* this

particular self, makes its own content. Its pure self, as it is empty knowledge, is without content and without definiteness. The content which it supplies to that knowledge is drawn from its own self, *qua* this determinate self, is drawn from itself as a natural individuality. In affirming the conscientiousness of its action, it is doubtless aware of its pure self, but in the purpose of its action — a purpose which brings in a concrete content — it is conscious of itself as this particular individual, and is conscious of the opposition between what it is for itself and what it is for others, of the opposition of universality or duty and its state of being reflected into self away from the universal.

While in this way the opposition, into which conscience passes when it acts, finds expression in its inner life, the opposition is at the same time disparity on its outer side, in the sphere of existence — the lack of correspondence of its particular individuality with reference to another individual. Its special peculiarity consists in the fact that the two elements constituting its consciousness — viz. the self and the inherent nature (*Ansich*) — are unequal in value and significance within it; an inequality in which they are so determined that certainty of self is the essential fact as against the inherent nature, or the universal, which is taken to be merely a moment. Over against this internal determination there thus stands the element of existence, the universal consciousness; for this latter it is rather universality, duty, that is the essential fact, while individuality, which exists for itself and is opposed to the universal, has merely the value of a superseded moment. The first consciousness is held to be *Evil* by the consciousness which thus stands by the fact of duty, because of the lack of correspondence of its internal subjective life with the universal; and since at the same time the first consciousness declares its act to be congruency with itself, to be duty and conscientiousness it is held by that universal consciousness to be *Hypocrisy.*

The course taken by this opposition is, in the first instance, the formal establishment of correspondence between what the evil consciousness is in its own nature and what it expressly says. It has to be made manifest that it *is* evil, and its objective existence thus made congruent with its real nature; the hypocrisy must be unmasked. This return of the discordance, present in hypocrisy, into the state of correspondence is not at once brought to pass by the mere fact that, as people usually say, hypocrisy just proves its reverence for duty and virtue through assuming the appearance of them, and using this as a mask to hide itself from its own consciousness no less than from another — as if, in this acknowledgment and recognition in itself of its opposite, *eo ipso* congruency and agreement were implied and contained. Yet even then it is just as truly done with this recognition in words and is reflected into self; and in the very fact of its using the inherent and essential reality merely as something which has a significance for another consciousness, there is really implied its own contempt for that inherent principle, and the demonstration of the worthlessness of that reality for all. For what lets itself be used as an external instrument shows itself to be a thing, which has within it no proper weight and worth of its own.

Moreover, this correspondence is not brought about either by the evil consciousness persisting onesidedly in its own state, or by the judgment of the universal consciousness. If the former denies itself as against the consciousness of duty, and maintains that what the latter pronounces to be baseness, to be absolute discordance with universality, is an action according to inner law and conscience, then, in this onesided assurance of identity and concord, there still remains its discordance with the other, since this other universal consciousness certainly does not believe the assurance and does not acknowledge it. In other words, since onesided insistence on one extreme destroys itself, evil would indeed thereby confess to being evil, but in so doing would at once cancel itself and cease to be hypocrisy, and so

would not *qua* hypocrisy be unmasked. It confesses itself, in fact, to be evil by asserting that, while opposing what is recognized as universal, it acts according to its own inner law and conscience. For were this law and conscience not the law of its individuality and caprice, it would not be something inward, something private, but what is universally accepted and acknowledged. When, therefore, any one says he acts towards others from a law and conscience of his own, he is saying, in point of fact, that he is abusing and wronging them. But actual conscience is not this insistence on a knowledge and a will which are opposed to what is universal; the universal is the element of its existence, and its very language pronounces its action to be *recognized* duty.

Just as little, when the universal consciousness persists in its own judgment, does this unmask and dissipate hypocrisy. When that universal consciousness stigmatizes hypocrisy as bad, base, and so on, it appeals, in passing such a judgment, to its *own* law, just as the evil consciousness appeals to *its* law. For the former law makes its appearance in opposition to the latter, and thereby as a particular law. It has, therefore, no antecedent claim over the other law; rather it legitimizes this other law. Hence the universal consciousness, by its zeal in abusing hypocrisy, does precisely the opposite of what it means to do: for it shows that its so-called "true duty", which ought to be universally acknowledged, is something not acknowledged and recognized, and consequently it grants other an equal right of independently existing on its own account.

This judgment [of universal consciousness], however, has, at the same time, another side to it, from which it leads the way to the dissolution of the opposition in question. Consciousness of the universal does not proceed, *qua* real and *qua* acting, to deal with the evil consciousness; for this latter, rather, is the real. In opposing the latter, it is a consciousness which is not entangled in the opposition of individual and universal involved in action. It

stays within the universality of thought, takes up the attitude of an apprehending intelligence, and its first act is merely that of judgment. Through this judgment it now places itself, as was just observed, alongside the first consciousness, and the latter through this likeness between them, comes to see itself in this other consciousness. For the consciousness of duty maintains the passive attitude of apprehension. Thereby it is in contradiction with itself as the absolute will of duty, as the self that determines absolutely from itself. It may well preserve itself in its purity, for it does not act; it is hypocrisy, which wants to see the fact of judging taken for the actual deed, and instead of proving its uprightness and honesty by acts does so by expressing fine sentiments. It is thus constituted entirely in the same way as that against which. the reproach is made of putting its phrases in place of duty. In both alike the aspect of reality is distinct from the express statements — in the one owing to the selfish purpose of the action, in the other through failure to act at all, although the necessity of acting is involved in the very speaking of duty, for duty without deeds is altogether meaningless.

The act of judging, however, has also to be looked at as a positive act of thought and has a positive content: this aspect makes the contradiction present in the apprehending consciousness, and its identity with the first consciousness, still more complete. The active consciousness declares its specific deed to be its duty, and the consciousness that passes judgment cannot deny this; for duty as such is form void of all content and capable of any. In other words, concrete action, inherently implying diversity in its manysidedness, involves the universal aspect, which is that which is taken as duty, just as much as the particular, which constitutes the share and interest the individual has in the act. Now the judging consciousness does not stop at the former aspect of duty and rest content with the knowledge which the active agent has of this, viz. that this is his duty, the condition and

the status of his reality. It holds on to the other aspect, diverts the act into the inner realm, and explains the act from selfish motives and from its inner intention, an intention different from the act itself. As every act is capable of treatment in respect of its dutifulness, so, too, each can be considered from this other point of view of particularity; for as an act it is the reality of an individual.

This process of judging, then, takes the act out of the sphere of its objective existence, and turns it back into the inner subjective sphere, into the form of private or individual particularity. If the act carries glory with it, then the inner sphere is judged as love of fame. If it is altogether conformity with the position of the individual, without going beyond this position, and is so constituted that the individuality in question does not have the position attached to it as an external feature, but through itself supplies concrete filling to this universality, and by that very process shows itself to be capable of a higher station-then the inner nature of the act is judged as ambition; and so on. Since, in the act in general, the individual who acts comes to see himself in objective form, or gets the feeling of his own being in his objective existence and thus attains enjoyment, the judgment on the act finds the inner nature of it to be an impulse towards personal happiness, even though this happiness were to consist merely in inner moral vanity, the enjoyment of a sense of personal excellence, and in the foretaste and hope of a happiness to come.

No act can escape being judged in such a way; for “duty for duty’s sake”, this pure purpose, is something unreal. What reality it has lies in the deed of some individuality, and the action thereby has in it the aspect of particularity. No hero is a hero to his valet, not, however, because the hero is not a hero, but because the valet is — the valet, with whom the hero has to do, not as a hero, but as a man who eats, drinks, and dresses, who, in short, appears as a private individual with certain personal wants and ideas

of his own. In the same way, there is no act in which that process of judgment cannot oppose the personal aspect of the individuality to the universal aspect of the act, and play the part of the "moral" valet towards the agent.

The consciousness, that so passes judgment, is in consequence *itself* base and mean, because it divides the act up, and produces and holds to the act's self-discordance. It is, furthermore, hypocrisy, because it gives out this way of judging, not as another fashion of being wicked, but as the correct consciousness of the act; sets itself up, in its unreality, in this vanity of knowing well and better, far above the deeds it decries; and wants to find its mere words without deeds taken for an admirable kind of reality.

On this account, then, putting itself on a level with the agent on whom it passes judgment, it is recognized by the latter as the same as himself. This latter does not merely find himself apprehended as something alien to, and discordant with, that other: but rather finds the other in its peculiar constitutive character identical with himself. Seeing this identity and giving this expression, he openly confesses himself to the other, and expects in like manner that the other, having in point of fact put itself on the same level, will respond in the same language, will therein give voice to this identity, and that thus the state of mutual recognition will be brought about. His confession is not an attitude of abasement or humiliation before the other, is not throwing himself away. For to give the matter expression in this way has not the one-sided character which would fix and establish his disparity with the other: on the contrary, it is solely because of seeing the identity of the other with him that he gives himself utterance. In making his confession he announces, from his side, their common identity, and does so for the reason that language is the existence of spirit as an immediate self. He thus expects that the other will make its own contribution to this manner of existence.

But the admission on the part of the one who is wicked, “I am so”, is not followed by a reply making a similar confession. This was not what that way of judging meant at all: far from it! It repels this community of nature, and is the “hardheartedness”, which keeps to itself and rejects all continuity with the other. By so doing the scene is changed. The one who made the confession sees himself thrust off, and takes the *other* to be in the wrong when he refuses to let his own inner nature go forth in the objective shape of an express utterance, when he contrasts the beauty of his own soul with the wicked individual, and opposes to the confession of the penitent the stiffnecked attitude of the self-consistent equable character, and the rigid silence of one who keeps himself to himself and refuses to throw himself away for some one else. Here we find asserted the highest pitch of revolt to which a spirit certain of itself can reach. For it beholds itself, *qua* this simple self-knowledge, in another conscious being, and in such a way that even the external form of this other is not an unessential “thing”, as in the case of an object of wealth, but thought; knowledge itself is what is held opposed to it. It is this absolutely fluid continuity of pure knowledge which refuses to establish communication with an other, which had, *ipso facto,* by making its confession, renounced separate isolated self-existence, had affirmed its particularity to be cancelled, and thereby established itself as continuous with the other, i.e. established itself as universal. The other however, in its own case reserves for itself its uncommunicative, isolated independence: in the case of the individual confessing, it reserves for him the very same independence, though the latter has already cast that away. It thereby proves itself to be a form of consciousness which is forsaken by and denies the very nature of spirit; for it does not understand that spirit, in the absolute certainty of itself, is master and lord over every deed, and over all reality, and can reject and cast them off and make them as if they had never been. At the same time, it does not see the contradiction it is committing in

not allowing a rejection, which has been made in express language, to pass for genuine rejection, while itself has the certainty of its own spiritual life, not in a concrete real act, but in its inner nature, and finds the objective existence of this inner being in the language of its own judgment. It is thus its own self which checks that other's return from the act to the spiritual objectivity of language, and to spiritual identity, and by its harshness produces the discordance which still remains.

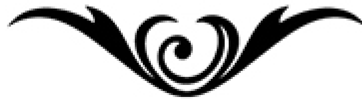
Now, so far as the spirit which is certain of itself, in the form of a "beautiful soul", does not possess the strength to relinquish the self-absorbed uncommunicative knowledge of itself, it cannot attain to any identity with the consciousness that is repulsed, and so cannot succeed in seeing the unity of its self in another life, cannot reach objective existence. The identity comes about, therefore, merely in a negative way, as a state of being devoid of spiritual character. The "beautiful soul", then, has no concrete reality; it subsists in the contradiction between its pure self and the necessity felt by this self to externalize itself and turn into something actual; it exists in the immediacy of this rooted and fixed opposition, an immediacy which alone is the middle term reconciling an opposition which has been intensified to its pure abstraction, and is pure being or empty nothingness. Thus the "beautiful soul", being conscious of this contradiction in its unreconciled immediacy, is unhinged, disordered, and runs to madness, wastes itself in yearning, and pines away in consumption. Thereby it gives up, as a fact, its stubborn insistence on its own isolated self-existence, but only to bring forth the soulless, spiritless unity of abstract being.

The true, that is to say the self-conscious and actual adjustment of the two sides is necessitated by, and already contained in the foregoing. Breaking the hard heart and raising it to the level of universality is the same process which was expressed in the case of the consciousness that openly made its confession. The wounds of the spirit heal and leave no scars

behind. The deed is not the imperishable element; spirit takes it back into itself; and the aspect of individuality present in it, whether in the form of an intention or of an existential negativity and limitation, is that which immediately passes away. The self which realizes, i.e. the form of the spirit's act, is merely a moment of the whole; and the same is true of the knowledge functioning through judgment, and establishing and maintaining the distinction between the individual and universal aspects of action. The evil consciousness, above spoken of, affirms this externalization of itself or asserts itself as a moment, being drawn into the way of express confession by seeing itself in another. This other, however, must have its onesided, unaccepted and unacknowledged judgment broken down, just as the former has to abandon its onesided unacknowledged existence in a state of particularity and isolation. And as the former displays the power of spirit over its reality, so this other must manifest the power of spirit over its constitutive, determinate notion.

The latter, however, renounces the thought that divides and separates, and the harshness of the self-existence which holds to such thought, for the reason that, in point of fact, it sees itself in the first. That which, in this way, abandons its reality and makes itself into a *superseded* particular "this" (*Diesen*), displays itself thereby as, in fact, universal. It turns away from its external reality back into itself as inner essence; and there the universal consciousness thus knows and finds itself.

The forgiveness it extends to the first is the renunciation of self, of its unreal essence, since it identifies with this essence that other which was real action, and recognizes what was called bad — a determination assigned to action by thought — to be good; or rather it lets go and gives up this distinction of determinate thought with its self-existent determining judgment, just as the other forgoes determining the act in isolation and for its own private behoof. The word of reconciliation is the objectively



existent spirit, which immediately apprehends the pure knowledge of itself *qua* universal essence in its opposite, in the pure knowledge of itself *qua* absolutely self-confined single individual — a reciprocal recognition which is Absolute Spirit.

Absolute Spirit enters existence merely at the culminating point at which its pure knowledge about itself is the opposition and interchange with itself. Knowing that its pure knowledge is the abstract essential reality, Absolute Spirit is this knowing duty in absolute opposition to the knowledge which knows itself, *qua* absolute singleness of self, to be the essentially real. The former is the pure continuity of the universal, which knows the individuality, that knows itself the real, to be inherently naught, to be evil. The latter, again, is absolute discreteness, which knows itself absolute in its pure oneness, and knows the universal is the unreal which exists only for others. Both aspects are refined and clarified to this degree of purity, where there is no self-less existence left, no negative of consciousness in either of them, where, instead, the one element of "duty" is the self-identical character of its self-knowledge, and the other element of "evil" equally has its purpose in its own inner being and its reality in its own mode of utterance. The content of this utterance is the substance that gives this spirit subsistence; the utterance is the assurance of the certainty of spirit within its own self.

These spirits, both certain of themselves, have each no other purpose than its own pure self, and no other reality and existence than just this pure self. But they are still different, and the difference is absolute, because holding within this element of the pure notion. The difference is absolute, too, not merely for *us* [tracing the experience], but for the notions themselves which stand in this opposition. For while these notions are indeed determinate and specific relatively to one another, they are at the same time in themselves universal, so that they fill out the whole range of

the self; and this self has no other content than this its own determinate constitution, which neither transcends the self nor is more restricted than it. For the one factor, the absolutely universal, is pure self-knowledge as well as the other, the absolute discreteness of single individuality, and both are merely this pure self-knowledge. Both determinate factors, then, are cognizing pure notions which know *qua* notions, whose very determinateness is immediately knowing, or, in other words, whose relationship and opposition is the Ego. Because of this they are for one another these absolute opposites; it is what is completely inner that has in this way come into opposition to itself and entered objective existence; they constitute pure knowledge, which, owing to this opposition, takes the form of consciousness. But as yet it is not *self-consciousness.* It obtains this actualization in the course of the process through which this opposition passes. For this opposition is really itself the indiscrete continuity and identity of ego=ego; and each by itself inherently cancels itself just through the contradiction in its pure universality, which, while implying continuity and identity, at the same time still resists its identity with the other, and separates itself from it. Through this relinquishment of separate selfhood, the knowledge, which in its existence is in a state of diremption, returns into the unity of the self; it is the concrete actual Ego, universal knowledge of self in its absolute opposite, in the knowledge which is internal to and within the self, and which, because of the very purity of its separate subjective existence, is itself completely universal. The reconciling affirmation, the "yes", with which both egos desist from their existence in opposition, is the existence of the ego expanded into a duality, an ego which remains therein one and identical with itself, and possesses the certainty of itself in its complete relinquishment and its opposite: it is God appearing in the midst of those who know themselves in the form of pure knowledge.

VII. RELIGION

Translator's comments: The appearance of Absolute Spirit as a principle constituting on its own account a distinctive stage of experience is at once a demand of the preceding development and a condition of making experience self-complete. Finite or socialized spiritual existence is at its best incapable of establishing the truth that "Spirit is the only reality"; for the more finite spirit approximates to the state of claiming to be self-contained the more is it dependent on universal self-consciousness. A trans-finite or Absolute Spiritual Being as such is thus necessary to realize and sustain the fullness of meaning which finite spirit possesses. Moreover, if "the truth is the whole", and only so is truth self-complete and self-explaining, and if reality is essentially spiritual — then experience only finds its complete meaning realized in the principle of Absolute Spirit. Hence the final stage of the *Phenomenology* of experience is the appearance therein of Absolute Spirit. Moreover, Absolute Spirit, in its own distinctive existence, could only appear at the end of the process of experience, for the whole of that process is required to reveal and to constitute the substance of which the Absolute consists. But the peculiarity of the stage now reached is that here the Absolute operates in its undivided totality to form a definite type of experience; or, in the language of the text, we have the Absolute here "conscious of its self". No doubt, in all the previous stages, "consciousness", "self-consciousness", "reason", "spirit", the Absolute has been implied as a limiting principle, at once substantiating and determining the boundaries of each stage: hence each stage had an Absolute of its own, the character of which was derived in each case from the peculiarity of the stage in question. Now, however, we have the Absolute by itself, in its

single self-completeness, as the sole formative factor of a certain type of experience.

The Absolute, then, in its own self-complete reality appears as the constitutive principle of experience. The experience here is the self-consciousness of Absolute Spirit; it appears to itself in all its objects. Since all the modes of finitude hitherto considered (consciousness, self-consciousness, etc.) are embraced in its single totality, it may use each and all of these various modes as the media through and in which to appear. When it appears in and through these modes of finitude we have the attitude of *Religion*. Since these modes, as we saw, differ, the religious attitude differs; and accordingly we have various types or forms of religion.

Each of these forms, in and through which the Absolute appears, is circumscribed in its nature and process; each is *per se* inadequate to the revelation of complete absolute self-consciousness: hence the variety of religion is necessitated by and is indirectly due to the failure of any one type and the inadequacy of every single type to reveal the Absolute completely. A form of appearance or self-manifestation of the absolute is therefore demanded which will reveal Absolute Spirit adequately to itself as it essentially is in itself. Here it will know itself, so to say, face to face, and with perfect completeness. This form is *Absolute Knowledge*. Hence Religion and Absolute Knowledge are the final stages in the argument of the *Phenomenology*. The former is dealt with in the immediately succeeding section (VII) and its various subsections; the latter forms the subject of the concluding section (VIII) of the work.

Religion in General

IN the forms of experience hitherto dealt with — which are distinguished broadly as Consciousness, Self-consciousness, Reason, and Spirit —

Religion also, the consciousness of Absolute Being in general, has no doubt made its appearance. But that was from the point of view of consciousness, when it has the Absolute Being for its object. Absolute Being, however, in its own distinctive nature, the Self-consciousness of Spirit, has not appeared in those forms.

Even at the plane of Consciousness, viz. when this takes the shape of "Understanding", there is a consciousness of the supersenuous, of the inner being of objective existence. But the supersensible, the eternal, or whatever we care to call it, is devoid of selfhood. It is merely, to begin with, something universal, which is a long way still from being spirit knowing itself as spirit.

Then there was Self-consciousness, which came to its final shape in the "unhappy consciousness"; that was merely the pain and sorrow of spirit wrestling to get itself out into objectivity once more, but not succeeding. The unity of individual self-consciousness with its unchangeable Being, which is what this stage arrives at, remains, in consequence, a "beyond", something afar off.

The immediate existence of Reason (which we found arising out of that state of sorrow), and the special shapes which reason assumes, have no form of religion, because self-consciousness in the case of reason knows itself or looks for itself in the direct and immediate present.

On the other hand, in the world of the Ethical Order, we met with a type of religion, the religion of the nether world. This is belief in the fearful and unknown darkness of Fate, and in the Eumenides of the spirit of the departed: the former being pure negation taking the form of universality, the latter the same negation but in the form of individuality. Absolute Being is, then, in the latter shape no doubt the self and is present, as there is no other way for the self to *be* except present. But the individual self is this individual ghostly shade, which keeps the universal element, Fate, separated

from itself. It is indeed a shade, a ghost, a cancelled and superseded particular, and so a universal self. But that negative meaning has not yet turned round into this latter positive significance, and hence the self, so cancelled and transcended, still directly means at the same time this particular being, this insubstantial reality. Fate, however, without self remains the darkness of night devoid of consciousness, which never comes to draw distinctions within itself, and never attains the clearness of self-knowledge.

This belief in a necessity that produces nothingness, this belief in the nether world, becomes belief in Heaven, because the self which has departed must be united with its universal nature, must unfold what it contains in terms of this universality, and thus become clear to itself. This kingdom of belief, however, we saw unfold its content merely in the element of reflective thought (*Denken*), without bringing out the true notion (*Begriff*); and we saw it, on that account, perish in its final fate, viz. in the religion of enlightenment. Here in this type of religion, the supersensible beyond, which we found in "understanding", is reinstate, but in such a way that self-consciousness rests and feels satisfied in the mundane present, not in the "beyond", and knows the supersensible beyond, void and empty, unknowable, and devoid of all terrors, neither as a self nor as power and might.

In the religion of Morality it is at last reinstated that Absolute Reality is a positive content; but that content is bound up with the negativity characteristic of the enlightenment. The content is an objective being, which. at the same time taken back into the self, and remains is there enclosed, and is a content with internal distinctions, while its parts are just as immediately negated as they are posited. The final destiny, however, which absorbs this contradictory process, is the self conscious of itself as the controlling necessity *(Schicksal)* of what is essential and actual.

Spirit knowing its self is in religion primarily and immediately its own pure self-consciousness. Those modes of it above considered— “objective spirit”, “spirit estranged from itself” and “spirit certain of its self” — together constitute what it is in its condition of consciousness, the state in which, being objectively opposed to its own world, it does not therein apprehend and consciously possess itself. But in Conscience it brings itself as well as its objective world as a whole into subjection, as also its idea and its various specific conceptions;and is now self-consciousness at home with itself. Here spirit, represented as an object, has the significance for itself of being Universal Spirit, which contains within itself all that is ultimate and essential and all that is concrete and actual; yet is not in the form of freely subsisting actuality, or of the apparent independence of external nature. It has a shape, no doubt, the form of objective being, in that it is object of its own consciousness; but because this consciousness is affirmed in religion with the essential character of being self-consciousness, the form or shape assumed is one perfectly transparent to itself; and the reality spirit contains is enclosed in it, or transcended in it, just in the same way as when we speak of “all reality”; it is “all reality”, but universal reality only in the sense of an object of thought.

Since, then, in religion, the peculiar characteristic of what is properly consciousness of spirit does not have the form of detached independent otherness, the existence of spirit is distinct from its self-consciousness, and its actual reality proper falls outside religion. There is no doubt one spirit in both, but its consciousness does not embrace both together; and religion appears as a part of existence, of acting, and of striving, whose other part is the life lived within spirit’s own actual world. As we now know that spirit in its own world and spirit conscious of itself as spirit, i.e. spirit in the sphere of religion, are the same, the completion of religion consists in the two forms becoming identical with one another: not merely in its reality

being grasped and embraced by religion, but conversely — it, as spirit conscious of itself, becomes actual to itself, and real object of its own consciousness.

So far as spirit in religion presents itself to itself, it is indeed consciousness, and the reality enclosed within it is the shape and garment in which it clothes its idea of itself. The reality, however, does not in this presentation get proper justice done to it, that is to say, it does not get to be an independent and free objective existence and not merely a garment. And conversely, because that reality lacks within itself its completion, it is a determinate shape or form, which does not attain to what it ought to reveal, viz. spirit conscious of itself. That spirit's shape might express spirit itself, the shape would have to be nothing else than spirit, and spirit would have to appear to itself, or to be actual, as it is in its own essential being. Only thereby, too, would be attained — what may seem to demand the opposite — that the object of its consciousness has, at the same time, the form of free and independent reality. But only spirit which is object to itself in the shape of Absolute Spirit, is as much aware of being a free and independent reality as it remains therein conscious of itself.

Since in the first instance self-consciousness and consciousness simply, religion, and spirit as it is externally in its world, or the objective existence of spirit, are distinct, the latter consists in the totality of spirit, so far as its moments are separated from each other and each is set forth by itself. These moments, however, are consciousness, self-consciousness, reason, and spirit — spirit, that is, *qua* immediate spirit, which is not yet consciousness of spirit. Their totality, taken all together, constitutes the mundane existence of spirit as a whole; spirit as such contains the previous separate embodiments in the form of universal determinations of its own being, in those moments just named. Religion presupposes that these have completely run their course, and is their simple totality, their absolute Self and soul.

The course which these traverse is, moreover, in relation to religion, not to be pictured as a temporal sequence. It is only spirit in its entirety that is in time, and the shapes assumed, which are specific embodiments Of the whole of spirit as such, present themselves in a sequence one after the other. For it is only the whole which properly has reality, and hence the form of pure freedom relatively to anything else, the form which takes expression as time. But the moments of the whole, consciousness, self-consciousness, reason, and spirit, have, because they are moments, no existence separate from one another.

Just as spirit was distinct from *its* moments, we have further, in the third place, to distinguish from these moments their specific individuated character. Each of those moments, in itself, we saw broke up again in a process of development all its own, and took various shapes and forms: as e.g. in the case of consciousness, sensuous certainty and perception were distinct phases. These latter aspects fall apart in time from one another, and belong to a specific particular whole. For spirit descends from its universality to assume an individual form through specific determination. This determination, or mediate element, is consciousness, self-consciousness, and so on. But *individuality* is constituted just bv the forms assumed by these moments. Hence these exhibit and reveal spirit in its individuality or concrete reality, and are distinguished in time from one another. though in such a way that the succeeding retains within it the preceding.

While, therefore, religion is the completion of the life of spirit, its final and complete expression, into which, as being their ground, its individual moments, consciousness, self-consciousness, reason, and spirit, return and have returned, they, at the same time, together constitute the objectively existing realization of spirit in its totality; as such spirit is real only as the moving process of these aspects which it possesses, a process of

distinguishing them and returning back into itself. In the process of these universal moments is contained the development of religion generally. Since, however, each of these attributes was set forth and presented, not only in the way it in general determines itself, but as it is in and for itself, i.e. as, within its own being, running its course as a distinct whole — there has thus arisen not merely the development of religion *generally*; those independently complete processes pursued by the individual phases or moments of spirit contain at the same time the determinate forms of religion itself. Spirit in its entirety, spirit in religion, is once more the process from its immediacy to the attainment of a knowledge of what it implicitly or immediately, is; and is the process of attaining the state where the shape and form, in which it appears as an object for its own consciousness, will be perfectly adequate to its essential nature, and where it will behold itself as it is.

In this development of religion, then, spirit itself assumes definite shapes, which constitute the distinctions involved in this process: and at the same time a determinate or specific form of religion has likewise an actual spirit of a specific character. Thus, if consciousness, self-consciousness, reason, and spirit belong to self-knowing spirit in general, in a similar way the specific shapes, which self-knowing spirit assumes, appropriate and adopt the distinctive forms which were specially developed in the case of each of the stages — consciousness, self-consciousness, reason, and spirit. The determinate shape, assumed in a given case by religion, appropriates, from among the forms belonging to each of its moments, the one adapted to it, and makes this its actual spirit. Any one determinate attitude of religion pervades and permeates all aspects of its actual existence, and stamps them with this common feature.

In this way the arrangement now assumed by the forms and shapes which have thus far appeared, is different from the way they appeared in

their own order. On this point we may note shortly at the outset what is necessary. In the series we considered, each moment, exhaustively elaborating its entire content, evolved and formed itself into a single whole within its own peculiar principle. And knowledge was the inner depth, or the spirit, wherein the moments, having no subsistence of their own, possessed their substance. This substance, however, has now at length made its appearance; it is the deep life of spirit certain of itself; it does not allow the principle belonging to each individual form to get isolated, and become a whole within itself: rather it collects all these moments into its own content, keeps them together, and advances within this total wealth of its concrete actual spirit; while all its particular moments take into themselves and receive together in common the like determinate character of the whole. This spirit certain of itself and the process it goes through-this is their true reality, the independent self-subsistence, which belongs to each individually.

Thus while the previous linear series in its advance marked the retrogressive steps in it by knots, but thence went forward again in one linear stretch, it is now, as it were, broken at these knots, these universal moments, and falls asunder into many lines, which, being bound together into a single bundle, combine at the same time symmetrically, so that the similar distinctions, in which each separately took shape within its own sphere, meet together.

For the rest, it is self-evident from the whole argument, how this co-ordination of universal directions, just mentioned, is to be understood; so that it becomes superfluous to remark that these distinctions are to be taken to mean essentially and only moments of the process of development, not parts. In the case of actual concrete spirit they are attributes of its substance; in religion, on the other hand, they are only predicates of the subject. In the same way, indeed, all forms in general are, in themselves or for us,

contained in spirit and contained in every spirit. But the main point of importance, in dealing with its reality, is solely what determinate character it has in its consciousness, in which specific character it has expressed its self, or in what shape it knows its essential nature.

The distinction made between actual spirit and that same spirit which knows itself as spirit, or between itself *qua* consciousness and *qua* self-consciousness, is transcended and done away with in the case where spirit knows itself in its real truth. Its consciousness and its self-consciousness have come to terms. But, as religion is here to begin with and immediately, this distinction has not yet reverted to spirit. It is merely the conception, the principle, of religion that is established at first. In this the essential element is self-consciousness, which is conscious of being all truth, and which contains all reality within that truth. This self-consciousness, being consciousness [and so aware of an object], has itself for its object. Spirit, which knows itself in the first instance immediately, is thus to itself spirit in the form of immediacy; and the specific character of the shape in which it appears to itself is that of pure simple being. This being, this bare existence, has indeed a filling drawn neither from sensation or manifold matter, nor from any other one-sided moments, purposes, and determinations; its filling is solely spirit, and is known by itself to be all truth and reality. Such filling is in this first form not in adequate agreement with its own shape, spirit *qua* ultimate essence is not in accord with its consciousness. It is actual only as Absolute Spirit, when it is also for itself in its truth as it is in its certainty of itself, or, when the extremes, into which spirit qua consciousness falls, exist for one another in spiritual shape. The embodiment adopted by spirit *qua* object of its own consciousness, remains filled by the certainty of spirit, and this self-certainty constitutes its substance. Through this content, the degrading of the object to bare objectivity, to the form of something that negates self-consciousness, disappears. The immediate unity of spirit with

itself is the fundamental basis, or pure consciousness, inside which consciousness breaks up into its constituent elements [viz. an object with subject over against it]. In this way, shut up within its pure self-consciousness, spirit does not exist in religion as the creator of a nature in general; rather what it produces in the course of this process are its shapes *qua* spirits, which together constitute all that it can reveal when it is completely manifested. And this process itself is the development of its perfect and complete actuality through the individual aspects thereof, i.e. through its imperfect modes of realization.

The first realization of spirit is just the principle and notion of religion itself-religion as immediate and thus Natural Religion. Here spirit knows itself as its object in a "natural" or immediate shape. The second realization, is, however, necessarily that of knowing itself in the shape of transcended and superseded natural existence, i.e. in the form of self. This therefore is Religion in the form of Art. For the shape it adopts is raised to the form of self through the productive activity of consciousness, by which this consciousness beholds in its object its own action, i.e. sees the self. The third realization, finally, cancels the one-sidedness of the first two: the self is as much as immediate self as the immediacy is a self. If spirit in the first is in the form of consciousness, and in the second in that of self-consciousness, it is in the third in the form of the unity of both; it has then the shape of what is completely self-contained (*An-und-Fürsichseyns*); and in being thus presented as it is in and for itself, this is Revealed Religion. Although spirit, however, here reaches its true shape, the very shape assumed and the conscious presentation are an aspect or phase still unsurmounted; and from this spirit has to pass over into the life of the Notion, in order therein completely to resolve the form of objectivity, in the notion which embraces within itself this its *own* opposite.

It is then that spirit has grasped its own principle, the notion of itself, as so far only we [who analyse spirit] have grasped it; and its shape, the element of its existence, in being the notion, is then spirit itself.

A

Natural Religion

Translator's comments: The arrangement of the analysis of Religion and the divisions into the various subsections are, as indicated in the preceding note (), determined by the general development of experience. That development is from the immediate through mediation to the fusion of immediacy and mediation. The stages of the development of experience are Consciousness, Self-consciousness, Reason, the latter leading to its highest level — finite Spiritual existence. The development of Religion follows these various ways in which objects are given in experience, and the three chief divisions of Religion are determined accordingly: Natural Religion is religion at the level of Consciousness; Art, Religion at the level of Self-consciousness; Revealed Religion is Religion at the level of Reason and Spirit. Each of these is again subdivided, and the subdivision follows more or less closely the various subdivisions of these three ultimate levels of experience — Consciousness, etc. Thus, in Natural Religion, we have Religion at the level of Sense-certainty— "Light": Religion at the level of Perception— "Life": and Religion at the level of Understanding — the reciprocal relation constituted by the "play of forces" appears as the relation of the "Artificer" to his own product.

The general principle is not worked out in detail, with the same obviousness, in the case of the other two primary types of Religion — Art and Revealed Religion. But the same general method of development is pursued in these cases.

The historical material before the mind of the writer is, as might be expected, the various religions which have historically appeared amongst mankind. These religions are treated, however, as illustrations of principles dominating the religious consciousness m general, rather than as merely historical phenomena.

With the succeeding argument should be read Hegel's *Philosophy of Religion*, Part II, Sections I and II, and Part III.

Natural Religion

SPIRIT knowing spirit is consciousness of itself; and is to itself in the form of objectivity. It *is;* and is at the same time self-existence (*Fürsichsein*). It is for itself; it is the aspect of self-consciousness, and is so in contrast to the aspect of its consciousness, the aspect by which it relates itself to itself as object. In its consciousness there is the opposition and in consequence the determinateness of the form in which it appears to itself and knows itself. It is with this determinateness of shape that we have alone to do in considering religion; for its essential unembodied principle, its pure notion, has already come to light. The distinction of consciousness and self-consciousness, however, falls at the same time within this notion. The form or shape of religion does not contain the existence of spirit in the sense of its being nature detached and free from thought, nor in the sense of its being thought detached from existence. The shape assumed by religion is existence contained and preserved in thought as well as a something thought which is consciously existent.

It is by the determinate character of this form, in which spirit knows itself, that one religion is distinguished from another. But we have at the same time to note that the systematic exposition of this knowledge about itself, in terms of this individual specific character, does not as a fact

exhaust the whole nature of an actual religion. The series of different religions, which will come before us, just as much sets forth again merely the different aspects of a single religion, and indeed of every single religion, and the imagery, the conscious ideas, which seem to mark off one concrete religion from another, make their appearance in each. All the same the diversity must also be looked at as a diversity of religion. For while spirit lives in the distinction of its consciousness and its self-consciousness, the process it goes through finds its goal in the transcendence of this fundamental distinction and in giving the form of self-consciousness to the given shape which is object of consciousness. This distinction, however, is not *eo ipso* transcended by the fact that the shapes, which that consciousness contains, have also the moments of self in them, and that God is *presented* as self-consciousness. The consciously presented self is not the actual concrete self. In order that this, like every other more specific determination of the shape, may in truth belong to this shape, it has partly to be put into this shape by the action of self-consciousness, and partly the lower determination must show itself to be cancelled and transcended and comprehended by the higher. For what is consciously presented (*vorgestellt*) only ceases to be something "*presented*" and alien to spirit's knowledge, by the self having produced it, and so viewing the determination of the object as its own determination, and hence seeing itself in that object. By this operation, the lower determination [that of being something "presented"] has at once vanished; for doing anything is a negative process which is carried through at the expense of something else. So far as that lower determination still continues to appear, it has withdrawn into the condition of unessentiality: just as, on the other hand, where the lower still predominates, while the higher is also present, the one coexists in a self-less way alongside of the other. While, therefore, the various ideas falling within a single religion no doubt exhibit the whole course taken by the forms of

religion, the character of each is determined by the particular unity of consciousness and self-consciousness; that is to say, by the fact that the self-consciousness has taken into itself the determination belonging to the object of consciousness, has, by its own action, made that determination altogether its own, and knows it to be the essential one as compared with the others.

The truth of belief in a given determination of the religious spirit shows itself in this, that the actual spirit is constituted after the same manner as the shape in which spirit beholds itself in religion; thus e.g. the incarnation of God, which is found in Eastern religion, has no truth, because the concrete actual spirit of this religion is without the reconciliation this principle implies.

It is not in place here to return from the totality of specific determinations back to the individual determination, and show in what shape the plenitude of all the others is contained within it and within its particular form of religion. The higher form, when put back under a lower, is deprived of its significance for self-conscious spirit, belongs to spirit merely in a superficial way, and is for it at the level of presentation. The higher form has to be considered in its own peculiar significance, and dealt with where it is the principle of a particular religion, and is certified and approved by its actual spirit.

a

God as Light

SPIRIT, as the absolute Being,, which is self-consciousness-or the self-conscious absolute Being, which is all truth and knows all reality as itself — is, to begin with, merely its notion and principle in contrast to the reality which it gives itself in the process of its conscious activity. And this notion is, as contrasted with the clear daylight of that explicit development, the

darkness and night of its inner life; in contrast to the existence of its various moments as independent forms or shapes, this notion is the creative secret of its birth. This secret has its revelation within itself; for existence has its necessary place in this notion, because this notion is spirit knowing itself, and thus possesses in its own nature the moment of being consciousness and of presenting itself objectively. We have here the pure ego, which in its externalization, in itself *qua* universal object, has the certainty of self; in other words, this object is, for the ego, the interfusion of all thought and all reality.

When the first and immediate cleavage is made within self-knowing Absolute Spirit, its shape assumes that character which belongs to immediate consciousness or to sense-certainty. It beholds itself in the form of being; but not being in the sense of what is without spirit, containing only the contingent qualities of sensation — the kind of being that belongs to sense-certainty. Its being is filled with the content of spirit. It also includes within it the form which we. found in the case of immediate self-consciousness, the form of lord and master, in regard to the self-consciousness of spirit which retreats from its object.

This being, having as its content the notion of spirit, is, then, the shape of spirit in relation simply to itself — the form of having no special shape at all. In virtue of this characteristic, this shape is the pure all-containing, all-suffusing Light of the Sunrise, which preserves itself in its formless indeterminate substantiality. Its counterpart, its otherness, is the equally simple negative — Darkness. The process of its own externalization, its creations in the unresisting element of its counterpart, are bursts of Light. At the same time in their ultimate simplicity they are its way of becoming something for itself, and its return from its objective existence, streams of fire consuming its embodiment. The distinction, which it gives itself, no doubt thrives abundantly on the substance of existence, and shapes itself as

the diverse forms of nature. But the essential simplicity of its thought rambles and roves about inconstant and inconsistent, enlarges its bounds to measureless extent, and its beauty heightened to splendour is lost in its sublimity.

The content, which this state of pure being evolves, its perceptive activity, is, therefore, an unreal by-play on this substance which merely rises, without setting into itself to become subject and secure firmly its distinctions through the self. Its determinations are merely attributes, which do not succeed in attaining independence; they remain merely names of the One, called by many names. This One is clothed with the manifold powers of existence and with the shapes of reality, as with a soulless, selfless ornament; they are merely messengers of its mighty power, claiming no will of their own, visions of its glory, voices in its praise.

This revel of heaving life must, however, assume the character of distinctive self-existence, and give enduring subsistence to its fleeting shapes. Immediate being, in which it places itself over against its own consciousness, is itself the negative destructive agency which dissolves its distinctions. It is thus in truth the Self; and spirit therefore passes on to know itself in the form of self. Pure Light scatters its simplicity as an infinity of separate forms, and presents itself as an offering to self-existence, that the individual may take sustainment to itself from its substance.

b

Plants and Animals as Objects of Religion

SELF-CONSCIOUS spirit, passing away from abstract, formless essence and going into itself-or, in other words, having raised its immediacy to the level of Self — makes its simple unity assume the character of a manifold

of self-existing entities, and is the religion of spiritual sense-perception. Here spirit breaks up into an innumerable plurality of weaker and stronger, richer and poorer spirits. This Pantheism, which, to begin with, consists in the quiescent subsistence of these spiritual atoms, passes into a process of active internal hostility. The innocence, which characterizes the flower and plant religions, and which is merely the selfless idea of Self, gives way to the seriousness of struggling warring life, to the guilt of animal religions; the quiescence and impotence of contemplative individuality pass into the destructive activity of separate self-existence.

It is of no avail to have removed the lifelessness of abstraction from the things of perception, and to have raised them to the level of realities of spiritual perception: the animation of this spiritual kingdom has death in the heart of it, owing to the determinateness and the negativity, which overcome and trench upon the innocent indifference [of the various species of plants] to one another. Owing to this determinateness and negativity, the dispersion of spirit into the multiplicity of the passive plant-forms becomes a hostile process, in which the hatred stirred up by their independent self-existence rages and consumes.

The actual self-consciousness at work in this dispersed and disintegrated spirit, takes the form of a multitude of individualized mutually-antipathetic folk-spirits, who fight and hate each other to the death, and consciously accept certain specific forms of animals as their essential being and nature: for they are nothing else than spirits of animals, or animal lives separate and cut off from one another, and with no universality consciously present in them.

The characteristic of purely negative independent self-existence, however, consumes itself in this active hatred towards one another; and through this process, involved in its very principle, spirit enters into another shape. Independent self-existence cancelled and abolished is the form of the

object, a form which is produced by the self, or rather is the self produced, the self-consuming self, i.e. the self that becomes a “thing”. The agent at work, therefore, retains the upper hand over these animal spirits merely tearing each other to pieces; and his action is not merely negative, but composed and positive. The consciousness of spirit is, thus, now the process which is above and beyond the immediate inherent [universal] nature, as well as transcends the abstract self-existence in isolation. Since the implicit inherent nature is reduced, through opposition, to the level of a specific character, it is no longer the proper form of Absolute Spirit, but a reality which its consciousness finds lying over against itself as an ordinary existing fact and cancels; at the same time this consciousness is not merely this negative cancelling self-existent being, but produces its own objective idea of itself,-self-existence put forth in the form of an object. This process of production is, all the same, not yet perfect production; it is a conditioned activity, the forming of a given material.

c

The Artificer

SPIRIT, then, here takes the form of the artificer, and its action, when producing itself as object, but without having as yet grasped the thought of itself, is an instinctive kind of working, like bees building their cells.

The first form, because immediate, has the abstract character of “understanding”, and the work accomplished is not yet in itself endued with spirit. The crystals of Pyramids and Obelisks, simple combinations of straight lines with even surfaces and equal relations of parts in which the incommensurability of roundness is set aside — these are the works produced by this artificer, the worker of the strict form. Owing to the purely abstract intelligible nature of the form, the work is not in itself its own true

significance; it is not the spiritual self. Thus, either the works produced only receive spirit into them as an alien, departed spirit, one that has forsaken its living suffusion and permeation with reality, and, being itself dead, enters into these lifeless crystals; or they take up an external relation to spirit as something which is itself there externally and not as spirit — they are related to it as to the Orient Light, which throws its significance on them.

The separation of elements from which spirit as artificer starts — the separation of the implicit essential nature, which becomes the material it works upon, and independent self-existence, which is the aspect of the self-consciousness at work-this division has become objective to spirit in its work. Its further endeavour has to be directed to cancelling and doing away with this separation of soul and body; it must strive to clothe and give embodied shape to soul *per se,* and endow the body with soul. The two aspects, in that they are brought closer to one another, bear towards each other, in this condition, the character of ideally presented spirit and of enveloping shell. Spirit's oneness with itself contains this opposition of individuality and universality. As the work comes closer to itself in the coming together of its aspects, there comes about thereby at the same time the other fact, that the work comes closer to the self-consciousness performing it, and that the latter attains in the work knowledge of itself as it truly is. In this way, however, the work merely constitutes to begin with the abstract side of the activity of spirit, which does not yet know the content of this activity within itself but in its work, which is a "thing". The artificer as such, spirit in its entirety, has not yet appeared; the artificer is still the inner, hidden reality, which *qua* entire is present only as broken up into active self-consciousness and the object it has produced.

The surrounding habitation, then, external reality, which has so far been raised merely to the abstract form of the understanding, is worked up by the artificer into a more animated form. The artificer employs plant life for this

purpose, which is no longer sacred as in the previous case of inactive impotent pantheism; rather the artificer, who grasps *himself* as the self existent reality, takes that plant life as something to be used and degrades it to an external aspect, to the level of an ornament. But it is not turned to use without some alteration: for the worker producing the self-conscious form destroys at the same time the transitoriness, inherently characteristic of the immediate existence of this life, and brings its organic forms nearer to the more exact and more universal forms of thought. The organic form, which, left to itself, grows and thrives in particularity, being on its side subjugated by the form of thought, elevates in turn these straight-lined and level shapes into more animated roundness — a blending which becomes the root of free architecture.

This dwelling, (the aspect of the universal element or inorganic nature of spirit), also includes within it now a form of individuality, which brings nearer to actuality the spirit that was formerly separated from existence and external or internal thereto, and thus makes the work to accord more with active self-consciousness. The worker lays hold, first of all, on the form of self-existence in general, on the forms of animal life. That he is no longer directly aware of himself in animal life, he shows by the fact that in reference to this he constitutes himself the productive force, and knows himself in it as being his own work, whereby the animal shape at the same time is one which is superseded and becomes the hieroglyphic symbol of another meaning, the hieroglyph of a thought. Hence also this shape is no longer solely and entirely used by the worker, but becomes blended with the shape embodying thought, with the human form. Still, the work lacks the form and existence where self exists as self: it also fails to express in its very nature that it includes within itself an inner meaning; it lacks language, the element in which the sense and meaning contained are actually present. The work done, therefore, even when quite purified of the animal aspect,

and bearing the form and shape of self-consciousness alone, is still the silent soundless shape, which needs the rays of the rising sun in order to have a sound which, when produced by light, is even then merely noise and not speech, shows merely an outer self, not the inner self.

Contrasted with this outer self of the form and shape, stands the other form, which indicates that it has in it an inner being. Nature, turning back into its essential being, degrades its multiplicity of life, ever individualizing itself and confounding itself in its own process, to the level of an unessential encasing shell, which is the covering for the inner being. And as yet this inner being is still simple darkness, the unmoved, the black formless stone.

Both representations contain inwardness and existence — the two moments of spirit: and both kinds of manifestation contain both moments at once in a relation of opposition, the self both as inward and as outward. Both have to be united. The soul of the statue in human form does not yet come out of the inner being, is not yet speech, objective existence of self which is inherently internal — and the inner being of multiform existence is still without voice or sound, still draws no distinctions within itself, and is still separated from its outer being, to which all distinctions belong. The artificer, therefore, combines both by blending the forms of nature and self-consciousness; and these ambiguous beings, a riddle to themselves — the conscious struggling with what has no consciousness, the simple inner with the multiform outer, the darkness of thought mated with the clearness of expression — these break out into the language of a wisdom that is darkly deep and difficult to understand.

With the production of this work, the instinctive method of working ceases, which, in contrast to self-consciousness, produced a work devoid of consciousness. For here the activity of the artificer, which constitutes self-consciousness, comes face to face with an inner being equally self-

conscious and giving itself expression. He has therein raised himself by his work up to the point where his conscious life breaks asunder, where spirit greets spirit. In this unity of self-conscious spirit with itself, so far as it is aware of being embodiment and object of its own consciousness, its blending and mingling with the unconscious state of immediate shapes of nature become purified. These monsters in form and shape, word and deed, are resolved and dissolved into a shape which is spiritual-an outer which has entered into itself, an inner which expresses itself out of itself and in itself,-they pass into thought, which brings forth itself, preserves the shape and form suited to thought, and is transparent existence. Spirit is *Artist*.

B

Religion in the Form of Art

SPIRIT has raised the shape in which it is object for its own consciousness into the form of consciousness itself; and spirit produces such a shape for itself. The artificer has given up the synthesizing activity, that blending of the heterogeneous forms of thought and nature. When the shape has gained the form of self-conscious activity, the artificer has become a spiritual workman.

If we next ask, what the actual spirit is, which finds in the religion of art the consciousness of its Absolute, it turns out that this is the ethical or objective spirit. This spirit is not merely the universal substance of all individuals; but when this substance is said to have, as an objective fact for actual consciousness, the form of consciousness, this amounts to saying that the substance, which is individualized, is known by the individuals within it as their proper essence and their own achievement. It is for them neither the Light of the World, in whose, unity the self-existence of self-consciousness is contained only negatively, only transitorily, and beholds the lord and

master of its reality; nor is it the restless waste and destruction of hostile nations; nor their subjection to “castes”, which together constitute the semblance of organization of a completed whole, where, however, the universal freedom of the individuals concerned is wanting. Rather this spirit is a free nation, in which custom and order constitute the common substance of all, whose reality and existence each and every one knows to be his own will and his own deed.

The religion of the ethical spirit, however, raises it above its actual realization, and is the return from its objectivity into pure knowledge of itself. Since an ethically constituted nation lives in direct unity with its own substance, and does not contain the principle of pure individualism of self-consciousness, the religion characteristic of its sphere first appears in complete form in its parting from its stable security. For the reality of the ethical substance rests partly on its quiet unchangeableness as contrasted with the absolute process of self-consciousness; and consequently on the fact that this self-consciousness has not yet left its serene life of customary convention and its confident security therein, and gone into itself. Partly, again, that reality rests on its organization into a plurality of rights and duties, as also on its organized distribution into the spheres of the various classes, each with its particular way of acting which co-operates to form the whole; and hence rests on the fact that the individual is contented with the limitation of his existence, and has not yet grasped the unrestricted thought of his free self. But that serene immediate confidence in the substance of this ethical life turns back into trust in self and certainty of self; and the plurality of rights and duties, as well as the restricted particular action this involves, is the same dialectic process in the sphere of the ethical life as the plurality of “things” and their various “qualities” — a process which only comes to rest and stability in the simplicity of spirit certain of self

The complete fulfilment of the ethical life in free self-consciousness, and the destined consummation (*Schicksal*) of the ethical world, are therefore that individuality which has entered into itself; the condition is one of absolute levity on the part of the ethical spirit; it has dissipated and resolved into itself all the firmly established distinctions constituting its own stability, and the separate spheres of its own articulated organization and, being perfectly sure of itself, has attained to boundless cheerfulness of heart and the freest enjoyment of itself. This simple certainly of spirit within itself has a double meaning; it is quiet stability and solid truth, as well as absolute unrest, and the disappearance of the ethical order. It turns round, however, into the latter; for the truth of the ethical spirit lies primarily just in this substantial objectivity and trust, in which the self does not know itself as free individual, and which, therefore, in this inner subjectivity, in the self becoming free, falls into ruins. Since then its trust is broken, and the substance of the nation cracked, spirit, which was the connecting medium of unstable extremes, has now come forward as an extreme — that of self-consciousness grasping itself as essential and ultimate. This is spirit certain within itself, which mourns over the loss of its world, and now out of the purity of self produces its own essential being, raised above actual reality.

At such an epoch art in absolute form comes on the scene. At the earlier stage it is instinctive in its operation; its operation is steeped in existence, works its way out of existence and works right into the existent; it does not find its substance in the free life of an ethical order, and hence, too, as regards the self operating does not exercise free spiritual activity.

Later on, spirit goes beyond art in order to gain its higher manifestation, viz. that of being not merely the substance born and produced out of the self, but of being. in its manifestation as object, this very self; it seeks at that higher level not merely to bring forth itself out of its own notion, but to

have its very notion as its shape, so that the notion and the work of art produced may know each other reciprocally as one and the same.

Since, then, the ethical substance has withdrawn from its objective existence into its pure self-consciousness, this is the aspect of the notion, or the activity with which spirit brings itself forth as object. It is pure form, because the individual in ethical obedience and service has so worked off every unconscious existence and every fixed determination, as the substance has itself become this fluid and undifferentiated essence. This form is the night in which the substance was betrayed, and made itself subject. It is out of this night of pure certainty of self that the ethical spirit rises again in a shape freed from nature and its own immediate existence.

The existence of the pure notion into which spirit has fled from its bodily shape, is an individual, which spirit selects as the vessel for its sorrow. Spirit acts in this individual as his universal and his power, from which he suffers violence, as his element of "Pathos", by having given himself over to which his self-consciousness loses freedom. But that positive power belonging to the universal is overcome by the pure self of the individual, the negative power. This pure activity, conscious of its inalienable force, wrestles with the unembodied essential being. Becoming its master, this negative activity has turned the element of pathos into its own material, and given itself its content; and this unity comes out as a work, universal spirit individualized and consciously presented.

a

The Abstract Work of Art

THE first work of art is, because immediate, abstract and particular. As regards itself, it has to move away from this immediate and objective phase towards self-consciousness, while, on the other side, the latter for itself

endeavours in the “cult” to do away with the distinction, which it at first gives itself in contrast to its own spirit, and by so doing to produce a work of art inherently endowed with life.

The first way in which the artistic spirit keeps as far as possible removed from each other its shape and its active consciousness, is immediate in character — the shape assumed is there as a “thing” in general. It breaks up into the distinction of individualness which has the shape of the self, and universality, which presents the inorganic nature in reference to the shape adopted, and is its environment and habitation. This shape assumed obtains its pure form, the form belonging to spirit, by the whole being raised into the sphere of the pure notion. It is not the crystal, belonging as we saw to the level of understanding, a form which housed and covered a lifeless element, or is shone upon externally by a soul. Nor, again, is it that commingling of

the forms of nature and thought, which first arose in connexion with plants, thought’s activity here being still an imitation. Rather the notion strips off the remnant of root, branches, and leaves, still clinging to the forms, purifies the forms, and makes them into figures in which the crystal’s straight lines and surfaces are raised into incommensurable relations, so that the animation of the organic is taken up into the abstract form of understanding, and, at the same time, its essential nature-incommensurability-is preserved for understanding.

The indwelling god, however, is the black stone extracted from the animal encasement, and suffused with the light of consciousness. The human form strips off the animal character with which it was mixed up. The animal form is for the god merely an accidental vestment; the animal appears alongside its true form, and has no longer a value on its own account, but has sunk into being a significant sign of something else, has become a mere symbol. By that very fact, the form assumed by the god in

itself casts off even the restrictions of the natural conditions of animal existence, and hints at the internal arrangements of organic life melted down into the surface of the form, and pertaining only to this surface.

The essential being of the god, however, is the unity of the universal existence of nature and of self-conscious spirit which in its actuality appears confronting the former. At the same time, being in the first instance an individual shape, its existence is one of the elements of nature, just as its self-conscious actuality is a particular national spirit. But the former is, in this unity, that element reflected back into spirit, nature made transparent by thought and united with self-conscious life. The form of the gods retains, therefore, within it its nature element as something transcended, as a shadowy, obscure memory. The utter chaos and confused struggle amongst the elements existing free and detached from each other, the non-ethical disordered realm of the Titans, is vanquished and banished to the outskirts of self-transparent reality, to the cloudy boundaries of the world which finds itself in the sphere of spirit and is there at peace. These ancient gods, first-born children of the union of Light with Darkness, Heaven, Earth, Ocean, Sun, earth's blind typhonic Fire, and so on, are supplanted by shapes, which do but darkly recall those earlier titans, and which are no longer things of nature, but clear ethical spirits of self-conscious nations.

This simple shape has thus destroyed within itself the dispeace of endless individuation, the individuation both in the life of nature, which operates with necessity only *qua* universal essence, but is contingent in its actual existence and process; and also in the life of a nation, which is scattered and broken into particular spheres of action and into individual centres of self-consciousness, and has an existence manifold in action and meaning. All this individuation the simplicity of this form has abolished, and brought together into an individuality at peace with itself. Hence the condition of unrest stands contrasted with this form; confronting quiescent individuality,

the essential reality, stands self-consciousness, which, being its source and origin, has nothing left over for itself except to be pure activity. What belongs to the substance, the artist imparted entirely to his work; to himself, however, as a specific individuality he gave in his work no reality. He could only confer completeness on it by relinquishing his particular nature, divesting himself of his own being, and rising to the abstraction of pure action.

In this first and immediate act of production, the separation of the work and his self-conscious activity is not yet healed again. The work is, therefore, not by itself really an animated thing; it is a whole only when its process of coming to be is taken along with it. The obvious and common element in the case of a work of art, that it is produced in consciousness and is made by the hand of man, is the moment of the notion existing *qua* notion, and standing in contrast to the work produced. And if this notion, *qua* the artist or spectator, is unselfish enough to declare the work of art to be *per se* absolutely animated, and to forget himself *qua* agent or onlooker, then, as against this, the notion of spirit has to be insisted on; spirit cannot dispense with the moment of being conscious of itself. This moment, however, stands in contrast to the work, because spirit, in this its primary disruption, gives the two sides their abstract and specifically contrasted characteristics of "doing" something and of being a "thing"; and their return to the unity they started from has not yet come about.

The artist finds out, then, in his work, that he did not produce a reality like himself. No doubt there comes back to him from his work a consciousness in the sense that an admiring multitude honours it as the spirit, which is their own true nature. But this way of animating his work, since it renders him his self-consciousness merely in the way of admiration, is rather a confession to the artist that the animated work is not on the same level as himself. Since his self comes back to him in the form of gladness in

general, he does not find therein the pain of his self-discipline and the pain of production, nor the exertion and strain of his own toil. People may, moreover, judge the work, or bring it offerings and gifts, or endue it with their consciousness in whatever way they like — if they with their knowledge set themselves *over* it, he knows how much more his act is than what they understand and say; if they put themselves *beneath* it, and recognize in it their own dominating essential reality, he knows himself as the master of this.

The work of art hence requires another element for its existence; God requires another way of going forth than this, in which, out of the depths of his creative night, he drops into the opposite, into externality, to the character of a "thing" with no self-consciousness. This higher element is that of Language-a way of existing which is directly self-conscious existence. When individual self-consciousness exists in that way, it is at the same time directly a form of universal contagion; complete isolation of independent self-existent selves is at once fluent continuity and universally communicated unity of the many selves; it is the soul existing as soul. The god, then, which takes language as its medium of embodiment, is the work of art inherently animated, endowed with a soul, a work which directly in its existence contains the pure activity which was apart from and in contrast to the god when existing as a "thing" In other words, self-consciousness, when its essential being becomes objective, remains in direct unison with itself. It is, when thus at home with itself in its essential nature, pure thought or devotion, whose inwardness gets at the same time express existence in the Hymn. The hymn keeps within it the individuality of self-consciousness, and this individual character is at the same time perceived to be there universal. Devotion, kindled in every one, is a spiritual stream which in all the manifold self-conscious units is conscious of itself as one and the same function in all alike and a simple state of being. Spirit, being

this universal self-consciousness of every one, holds in a single unity its pure inwardness as well as its objective existence for others and the independent self-existence of the individual units.

This kind of language is distinct from another way God speaks, which is not that of universal self-consciousness. The Oracle, both in the case of the god of the religions of art as well as of the preceding religions, is the necessary and the first form of divine utterance. For God's very principle implies that God is at once the essence of nature and of spirit, and hence has not merely natural but spiritual existence as well. In so far as this moment is merely implied as yet in God's principle and is not realized in religion, the language used is, for the religious self-consciousness, the speech of an alien and external self-consciousness. The self-consciousness which remains alien and foreign to its religious communion, is not yet there in the way its essential principle requires it should be. The self is simple self-existence, and thereby is altogether universal self-existence; that self, however, which is cut off from the self-consciousness of the communion, is primarily a mere individual self.

The content of this its own peculiar and individual form of speech results from the general determinate character which the Absolute Spirit is affirmed to have in its religion as such. Thus the universal spirit of the Sunrise, which has not yet particularized its existence, utters about the Absolute equally simple and universal statements, whose substantial content is sublime in the simplicity of its truth, but at the same time appears, because of this universality, trivial to the self-consciousness developing further.

The further developed self, which advances to being distinctively for itself, rises above the pure "pathos" of [unconscious] substance, gets the mastery over the objectivity of the Light of the rising Sun, and knows that simplicity of truth to be the inherent reality (*das Ansichseyende*) which does

not possess the form of contingent existence through an utterance of an alien self, but is the sure and unwritten law of the gods, a law that “lives for ever, and no man knows what time it came”.

As the universal truth, revealed by the “Light” of the world, has here returned into what is within or what is beneath, and has thus got rid of the form of contingent appearance; so too, on the other hand, in the religion of art, because God’s shape has taken on consciousness and hence individuality in general, the peculiar utterance of God, who is the spirit of an ethically constituted nation, is the Oracle, which knows its special circumstances and situation, and announces what is serviceable to its interests. Reflective thought, however, claims for itself the universal truths enunciated, because these are known as the essential inherent reality of the nation’s life; and the utterance of them is thus for such reflexion no longer a strange and alien speech, but is its very own. Just as that wise man of old searched in his own thought for what was worthy and good, but left it to his “Daimon” to find out and decide the petty contingent content of what he wanted to know — whether it was good for him to keep company with this or that person, or good for one of his friends to go on a journey, and such like unimportant things; in the same way the universal consciousness draws the knowledge about the contingent from birds, or trees, or fermenting earth, the steam from which deprives the self-conscious mind of its sanity of judgment. For what is accidental is not the object of sober reflexion, and is extraneous; and hence the ethical consciousness lets itself, as if by a throw of the dice, settle the matter in a manner that is similarly unreflective and extraneous. If the individual, by his understanding, determines on a certain course, and selects, after consideration, what is useful for him, it is the specific nature of his particular character which is the ground of this self-determination. This basis is just what is contingent; and that, knowledge which his understanding supplies as to what is useful for the

individual, is hence just such a knowledge as that of “oracles” or of the “lot”; only that he who questions the oracle or lot, thereby shows the ethical sentiment of indifference to what is accidental, while the former, on the contrary, treats the inherently contingent as an essential concern of his thought and knowledge. Higher than both, however, is to make careful reflexion the oracle for contingent action, but yet to recognize that this very act reflected on is something contingent, because it refers to what is opportune and has a relation to what is particular.

The true self-conscious existence, which spirit receives in the form of speech, which is not the utterance of an alien and so accidental, i.e. not universal, self-consciousness, is the work of art which we met with before. It stands in contrast to the statue, which has the character of a “thing”. As the statue is existence in a state of rest, the other is existence in a state of transience. In the case of the former, objectivity is set free and is without the immediate presence of a self of its own; in the latter, on the other hand, objectivity is too much confined within the self, attains insufficiently to definite embodiment, and is, like time, no longer there just as soon as it is there.

The religious Cult constitutes the process of the two sides — a process in which the divine embodiment in motion within the pure feeling-element of self-consciousness, and its embodiment at rest in the element of thinghood, reciprocally abandon the different character each possesses, and the unity, which is the underlying principle of their being, becomes an existing fact. Here in the Cult, the self gives itself a consciousness of the Divine Being descending from its remoteness into it, and this Divine Being, which was formerly the unreal and merely objective, thereby receives the proper actuality of self-consciousness.

This principle of the Cult is essentially contained and present already in the flow of the melody of the Hymn. These hymns of devotion are the way

the self obtains immediate pure satisfaction through and within itself. It is the soul purified, which, in the purity it thus attains, is immediately and only absolute Being, and is one with absolute Being. The soul, because of its abstract character, is not consciousness distinguishing its object from itself, and is thus merely the night of the object's existence and the place prepared for its shape. The abstract Cult, therefore, raises the self into being this pure divine element. The soul fulfils the attainment of this purity in a conscious way. Still the soul is not yet the self, which has descended to the depths of its being, and knows itself as evil. It is something that merely is, a soul, which cleanses its exterior with the washing of water, and robes it in white, while its innermost traverses the imaginatively presented path of labour, punishment, and reward, the way of spiritual discipline in general, of relinquishing its particularity — the road by which it reaches the mansions and the fellowship of the blest.

This ceremonial cult is, in its first form, merely in secret, i.e. is a fulfilment accomplished merely in idea, and unreal in fact. It has to become a real act, for an unreal act is a contradiction in terms. Consciousness proper thereby raises itself to the level of its pure self-consciousness. The essential Being has in it the significance of a free object; through the actual cult this object turns back into the self; and in so far as, in pure consciousness, it has the significance of absolute Being dwelling in its purity beyond actual reality, this Being descends, through this mediating process of the cult, from its universality into individual form, and thus combines and unites with actual reality.

The way the two sides make their appearance in the act is of such a character that the self-conscious aspect, so far as it is actual consciousness, finds the absolute Being manifesting itself as actual nature. On the one hand, nature belongs to self-consciousness as its possession and property, and stands for what has no existence *per se.* On the other hand, nature is its

proper immediate reality and particularity, which is equally regarded as not essential, and is superseded. At the same time, that external nature has the opposite significance for its pure consciousness — viz. the significance of being the inherently real, for which the self sacrifices its own [relative] unreality, just as, conversely, the self sacrifices the unessential aspect of nature to itself. The act is thereby a spiritual movement, because it is this double-sided process of cancelling the abstraction of absolute Being (which is the way devotion determines the object), and making it something concrete and actual, and, on the other hand, of cancelling the actual (which is the way the agent determines the object and the self acting), and raising it into universality.

The practice of the religious Cult begins, therefore, with the pure and simple "offering up" or "surrender" of a possession, which the owner, apparently without any profit whatsoever to himself, pours away or lets rise up in smoke. By so doing he renounces before the absolute Being of his pure consciousness all possession and right of property and enjoyment thereof; renounces personality and the reversion of his action to his self; and instead, reflects the act into the universal, into the absolute Being rather than into himself. Conversely, however, the objective ultimate Being too is annihilated in that very process. The animal offered up is the symbol of a god; the fruits consumed are the actual living Ceres and Bacchus. In the former die the powers of the upper law the [Olympians] which has blood and actual life, in the latter the powers of the lower law [the Furies] which possesses in bloodless form secret and crafty power.

The sacrifice of the divine substance, so far as it is active, belongs to the side of self-consciousness. That this concrete act may be possible, the absolute Being must have from the start *implicitly* sacrificed *itself.* This it has done in the fact that it has given itself definite existence, and made itself an individual animal and fruit of the earth. The self actively sacrificing

demonstrates in actual existence, and sets before its own consciousness, this already implicitly completed self-renunciation on the part of absolute Being; and replaces that immediate reality, which absolute Being has, by the higher, viz. that of the self making the sacrifice. For the unity which has arisen, and which is the outcome of transcending the singleness and separation of the two sides, is not merely negative destructive fate, but has a positive significance. It is merely for the abstract Being of the nether world that the sacrifice offered to it is wholly surrendered and devoted; and, in consequence, it is only for that Being that the reflexion of personal possession and individual self-existence back into the Universal is marked distinct from the self as such. At the same time, however, this is only a trifling part; and the other act of sacrifice is merely the destruction of what cannot be used, and is really the preparation of the offered substance for a meal, the feast that cheats the act out of its negative significance. The person making the offering at that first sacrifice reserves the greatest share for his own enjoyment; and reserves from the latter sacrifice what is useful for the same purpose. This enjoyment is the negative power which cancels the absolute Being as well as the singleness; and this enjoyment is, at the same time, the positive actual reality in which the objective existence of absolute Being is transmuted into self-conscious existence, and the self has consciousness of its unity with its Absolute.

This cult, for the rest, is indeed an actual act, although its meaning lies for the most part only in devotion. What pertains to devotion is not objectively produced, just as the result when confined to the feeling of enjoyment is robbed of its external existence. The Cult, therefore, goes further, and replaces this defect, in the first instance by giving its devotion an objective subsistence, since the cult is the common task-or the individual takes for each and all to do-which produces for the honour and glory of God a House for Him to dwell in and adornment for His presence. By so doing,

partly the external objectivity of statuary is cancelled; for by thus dedicating his gifts and his labours the worker makes God well disposed towards him and looks on his self as detached and appertaining to God. Partly, too, this action is not the individual labour of the artist; this particularity is dissolved in the universality. But it is not only the honour of God which is brought about, and the blessing of His countenance and favour is not only shed in idea and imagination on the worker; the work also has a meaning the reverse of the first which was that of self-renunciation and of honour done to what is alien and external. The Halls and Dwellings of God are for the use of man, the treasures preserved there are in time of need his own; the honour which God enjoys in his decorative adornment, is the honour and glory of the artistic and magnanimous nation. At the festival season, the people adorn their own dwellings, their own garments, as well as God's establishments with furnishings of elegance and grace. In this manner they receive a return for their gifts from a responsive and grateful God; and receive the proofs of His favour-wherein the nation became bound to the God because of the work done for Him-not as a hope and a deferred realization, but rather, in testifying to His honour and in presenting gifts, the nation finds directly and at once the enjoyment of its own wealth and adornment.

b

The Living Work of Art

THAT nation which approaches its god in the cult of the religion of art is an ethically constituted nation, knowing its State and the acts of the State to be the will and the achievement of its own self. This universal spirit, confronting the self-conscious nation, is consequently not the "Light-God", which, being selfless does not contain the certainty of the individual selves,

but is only their universal ultimate Being and the dominating imperious power, wherein they disappear. The religious cult of this simple unembodied ultimate Being gives back, therefore, to its votaries in the main merely this: that they are the nation of their god. It secures for them merely their stable subsistence, and their simple substance as a whole; it does not secure for them their actual self; this is indeed rejected. For they revere their god as the empty profound, not as spirit. The cult, however, of the religion of art, on the other hand, is without that abstract simplicity of the absolute Being, and therefore without its "profundity". But that Being, which is directly at one with the self, is inherently spirit and comprehending truth, although not yet truth known explicitly, in other words not knowing the "depths" of its nature. Because this Absolute, then, implies self, consciousness finds itself at home with it when it appears; and, in the cult, this consciousness receives not merely the general title to its own subsistence, but also its self-conscious existence within it: just as, conversely, the Absolute has no being in a despised and outcast nation whose mere substance is acknowledged, whose reality is selfless, but in the nation whose self is acknowledged as living in its substance.

From the ceremonial cult, then, self-consciousness that is at peace and satisfied in its ultimate Being turns away, as also does the god that has entered into self-consciousness as into its place of habitation. This place is, by itself, the night of mere "substance", or its pure individuality; but no longer the strained and striving individuality of the artist, which has not yet reconciled itself with its essential Being that is striving to become objective; it is the night [substance] satisfied, having its "pathos" within it and in want of nothing, because it comes back from intuition, from objectivity which is overcome and superseded.

This "pathos" is, by itself, the Being of the Rising Sun, a Being, however, which has now "set" and disappeared within itself, and has its

own “setting”, self-consciousness, within it, and so contains existence and reality.

It has here traversed the process of its actualization. Descending from its pure essentiality and becoming an objective force of nature and the expressions of this force, it is an existence relative to an other, an objective existence for the self by which it is consumed. The silent inner being of selfless nature attains in its fruits the stage where nature, duly self-prepared and digested, offers itself as material for the life which has a self. In its being useful for food and drink it reaches its highest perfection. For therein it is the possibility of a higher existence, and comes in touch with spiritual existence. In its metamorphosis the spirit of the earth has developed and become partly a silently energizing substance, partly spiritual ferment; in the first case it is the feminine principle, the nursing mother, in the other the masculine principle, the self-driving force of self-conscious existence.

In this enjoyment, then, that orient “Light” of the world is discovered for what it really is: Enjoyment is the Mystery of its being. For mysticism is not concealment of a secret, or ignorance; it consists in the self knowing itself to be one with absolute Being, and in this latter, therefore, becoming revealed. Only the self is revealed to itself; or what is manifest is so merely in the immediate certainty of itself. But it is just in such certainty that simple absolute Being has been placed by the cult. As a thing that can be used, it has not only existence which is seen, felt, smelt, tasted; it is also object of desire, and, by actually being enjoyed, it becomes one with the self, and thereby disclosed completely to this self, and made manifest.

When we say of anything, “it is manifest to reason, to the heart”, it is in point of fact still secret, for it still lacks the actual certainty of immediate existence, both the certainty regarding what is objective, and the certainty of enjoyment, a certainty which in religion, however, is not only immediate and unreflecting, but at the same time purely cognitive certainty of self.

What has thus been, through the cult, revealed to self-conscious spirit within itself, is simple absolute Being; and this has been revealed partly as the process of passing out of its dark night of concealment up to the level of consciousness, to be there its silently nurturing substance; partly, however, as the process of losing itself again in nether darkness, in the self, and of waiting above merely with the silent yearning of motherhood. The more conspicuous moving impulse, however, is the variously named "Light" of the Rising Sun and its tumult of heaving life, which, having likewise desisted from its abstract state of being, has first embodied itself in objective existence in the fruits of the earth, and then, surrendering itself to self-consciousness, attained there to its proper realization; and now it curvets and careers about in the guise of a crowd of excited, fervid women, the unrestrained revel of nature in self-conscious form.

Still, however, it is only Absolute Spirit in the sense of this simple abstract Being, not as spirit *per se*, that is discovered to consciousness: i.e. it is merely immediate spirit, the spirit of nature. Its self-conscious life is therefore merely the mystery of the Bread and the Wine, of Ceres and Bacchus, not of the other, the strictly higher, gods [of Olympus], whose individuality includes, as an essential moment, self-consciousness as such. Spirit has not yet *qua* self-conscious spirit offered itself up to it, and the mystery of bread and wine is not yet the mystery of flesh and blood.

This unstable divine revel must come to rest as an object, and the enthusiasm, which did not reach consciousness, must produce a work which confronts it as the statue stands over against the enthusiasm of the artist in the previous case — a work indeed that is equally complete and finished, yet not as an inherently lifeless but as a living self. Such a cult is the Festival which man makes in his own honour, though not yet imparting to a cult of that kind the significance of the Absolute Being; for it is the ultimate Being that is first revealed to him, not yet Spirit — not such a Being as

essentially takes on human form. But this cult provides the basis for this revelation, and lays out its moments individually and separately. Thus we here get the abstract moment of the living embodiment of ultimate Being, just as formerly we had the unity of both in the state of unconstrained emotional fervency. In the place of the statue man thus puts himself as the figure elaborated and moulded for perfectly free movement, just as the statue is the perfectly free state of quiescence. If every individual knows how to play the part at least of a torchbearer, one of them comes prominently forward who is the very embodiment of the movement, the smooth elaboration, the fluent energy and force of all the members. He is a lively and living work of art, which matches strength with its beauty; and to him is given, as a reward for his force and energy, the adornment, with which the statue was honoured [in the former type of religion], and the honour of being, amongst his own nation,, instead of a god in stone, the highest bodily representation of what the essential Being of the nation is.

In both the representations, which have just come before us, there is present the unity of self-consciousness and spiritual Being; but they still lack their due balance and equilibrium. In the case of the bacchic revelling enthusiasm the self is beside itself; in bodily beauty of form it is spiritual Being that is outside itself. The dim obscurity of consciousness in the one case and its wild stammering utterance, must be taken up into the transparent existence of the latter; and the clear but spiritless form of the latter, into the emotional inwardness of the former. The perfect element in which the inwardness is as external as the externality is inward, is once again Language. But it is neither the language of the oracle, entirely contingent in its content and altogether individual in character; nor is it the emotional hymn sung in praise of a merely individual god; nor is it the meaningless stammer of delirious bacchantic revelry. It has attained to its clear and universal content and meaning. Its content is *clear*, for the

artificer has passed out of the previous state of entirely substantial enthusiasm, and worked himself into a definite shape, which is his own proper existence, permeated through all its movements by self-conscious soul, and is that of his contemporaries. Its content is *universal*, for in this festival, which is to the honour of man, there vanishes the onesidedness peculiar to figures represented in statues, which merely contain a national spirit, a determinate character of the godhead. The finely built warrior is indeed the honour and glory of his particular nation; but he is a physical or corporeal individuality in which are sunk out of sight the expanse and the seriousness of meaning, and the inner character of the spirit which underlies the particular mode of life, the peculiar petitions, the needs and the customs of his nation. In relinquishing all this for complete corporeal embodiment, spirit has laid aside the particular impressions, the special tones and chords of that nature which it, as the actual spirit of the nation, includes. Its nation, therefore, is no longer conscious in this spirit of its special particular character, but rather of having laid this aside, and of the universality of its human existence.

c

The Spiritual Work of Art

THE national spirits, which become conscious of their being in the shape of some particular animal, coalesce into one single spirit. Thus it is that the separate artistically beautiful national spirits combine to form a Pantheon, the element and habitation of which is Language. Pure intuition of self in the sense of universal human nature takes, when the national spirit is actualized, this form: the national spirit combines with the others (which with it constitute, through nature and natural conditions, one people), in a common undertaking, and for this task builds up a collective nation, and,

with that, a collective heaven. This universality, to which spirit attains in its existence, is, nevertheless, merely this first universality, which, to begin with, starts from the individuality of ethical life, has not yet overcome its immediacy, has not yet built up a single state out of these separate national elements. The ethical life of an actual national spirit rests partly on the immediate confiding trust of the individuals in the whole of their nation, partly in the direct share which all, in spite of differences of class, take in the decisions and acts of its government. In the union, not in the first instance to secure a permanent order but merely for a common act, that freedom of participation on the part of each and all is for the nonce set aside. This first community of life is, therefore, an assemblage of individualities rather than the dominion and control of abstract thought, which would rob the individuals of their self-conscious share in the will and act of the whole.

The assembly of national spirits constitutes a circle of forms and shapes, which now embraces the whole of nature, as well as the whole ethical world. They too are under the supreme command rather than the supreme dominion of the One. By themselves, they are the universal substances embodying what the self-conscious essential reality inherently is and does. This, however, constitutes the moving force, and, in the first instance, at least the centre, with which those universal entities are concerned, and which, to begin with, seems to unite in a merely accidental way all that they variously accomplish. But it is the return of the divine Being to self-consciousness which already contains the reason that self-consciousness forms the centre for those divine forces, and conceals their essential unity in the first instance under the guise of a friendly external relation between both worlds.

The same universality, which belongs to this content, attaches necessarily also to that form of consciousness in which the content appears.

It is no longer the concrete acts of the cult; it is an action which is not indeed raised as yet to the level of the notion, but only to that of ideas, the synthetic connexion of self-conscious and external existence. The element in which these presented ideas exist, language, is the earliest language, the *Epic* as such., which contains the universal content, at any rate universal in the sense of completeness of the world presented, though not in the sense of universality of thought. The Minstrel is the individual and actual spirit from whom, as a subject of this world, it is produced, and by whom it is borne. His "pathos" is not the deafening power of nature, but Mnemosyne, Recollection, a gradually evolved inwardness, the memory of an essential mode of being once directly present. He is the organ and instrument whose content is passing away; it is not his own self which is of any account, but his muse, his universal song. What, however, is present in fact, has the form of an inferential process, where the one extreme of universality, the world of gods, is connected with individuality, the minstrel, through the middle term of particularity. The middle term is the nation in its heroes, who are individual men like the minstrel, but only ideally presented, and thereby at the same time universal like the free extreme of universality, the gods.

In this Epic, then, what is inherently established in the cult, the relation of the divine to the human, is set forth and displayed as a whole to consciousness. The content is an "act" of the essential Being conscious of itself. Acting disturbs the peace of the substance, and awakens the essential Being; and by so doing its simple unity is divided into parts, and opened up into the manifold world of natural powers and ethical forces. The act is the violation of the peaceful earth; it is the trench which, vivified by the blood of the living, calls forth the spirits of the departed, who are thirsting for life, and who receive it in the action of self-consciousness. There are two sides to the business the universal activity is concerned to accomplish: the side of the self-in virtue of which it is brought about by a collection of actual

nations with the prominent individualities at the head of them; and the side of the universal — in virtue of which it is brought about by their substantial forces. The relation of the two, however, took, as we saw just now, the character of being the synthetic connexion of universal and individual, i.e. of being a process of ideal presentation. On this specific character depends the judgment regarding this world.

The relation of the two is, by this means, a commingling of both, which illogically divides the unity of the action, and in a needless fashion throws the act from one side over to the other. The universal powers have the form of individual beings, and thus have in them the principle from which action comes; when they effect anything, therefore, this seems to proceed as entirely from them and to be as free as in the case of men. Hence both gods and men have done one and the same thing. The seriousness with which those divine powers go to work is ridiculously unnecessary, since they are in point of fact the moving force of the individualities engaged in the acts; while the strain and toil of the latter again is an equally useless effort, since the former direct and manage everything. Overzealous mortal creatures, who are as nothing, are at the same time the mighty self that brings into subjection the universal beings, offends the gods, and procures for them actual reality and an interest in acting. Just as, conversely, these powerless gods, these impotent universal beings, who procure their sustenance from the gifts of men and through men first get something to do, are the natural inner principle and the substance of all events, as also the ethical material, and the "pathos" of action. If their cosmic natures first get reality and a sphere of effectual operation through the free self of individuality, it is also the case that they are the universal, which withdraws from and avoids this connexion, remains unrestricted and unconstrained in its own character, and, by the unconquerable elasticity of its unity, extinguishes the atomic singleness of the individual acting and his various features, preserves itself

in its purity, and dissolves all that is individual in the current of its own continuity.

Just as the gods fall into this contradictory relation with the antithetic nature having the form of self, in the same way their universality comes into conflict with their own specific character and the relation in which it stands to others. They are the eternal and resplendent individuals, who exist in their own calm, and are removed from the changes of time and the influence of alien forces. But they are at the same time determinate elements, particular gods, and thus stand in relation to others. But that relation to others, which, in virtue of the opposition it involves, is one of strife, is a comic self-forgetfulness of their eternal nature. The determinateness they possess is rooted in the divine subsistence, and in its specific limitation has the independence of the whole individuality; owing to this whole, their characters at once lose the sharpness of their distinctive peculiarity, and in their ambiguity blend together.

One purpose of their activity and their activity itself, being directed against an "other" and so against an invincible divine force, are a contingent and futile piece of bravado, which passes away at once, and transforms the pretence of seriousness in the act into a harmless, self-confident piece of sport with no result and no issue. If, however, in the nature of their divinity, the negative element, the specific determinateness of that nature, appears merely as the inconsistency of their activity, and as the contradiction between the purpose and result, and if that independent self-confidence outweighs and overbalances the element of determinateness, then, by that very fact, the pure force of negativity confronts and opposes their nature, and moreover with a power to which it must finally submit, and over which it can in no way prevail. They are the universal, and the positive, as against the individual self of mortals, which cannot hold out against their power and might. But the universal self, for that reason, hovers over them [the

gods in Homer] and over this whole world of imagination to which the entire content belongs; and is for them the unintelligible void of Necessity — a mere happening to which they stand related selfless and sorrowing, for these determinate natures do not find themselves in this purely formal necessity.

This necessity, however, is the unity of the notion, a unity dominating and controlling the contradictory independent subsistence of the individual moments a unity in which the inconsistency and fortuitousness of their action is coherently regulated, and the sportive character of their acts receives its serious value in those acts themselves. The content of the world of imagination carries on its process in the middle element [term] detached by itself, gathering round the individuality of some hero, who, however feels the strength and splendour of his life broken, and mourns the early death he sees ahead of him. For individuality, firmly established and real in itself, is isolated and excluded to the utmost extreme, and severed into its moments, which have not yet found each other and united. The one individual element, the abstract unreal moment, is necessity which shares in the life of the mediating term just as little as does the other, the concrete real individual element, the minstrel, who keeps himself outside it, and disappears in what he imaginatively presents. Both extremes must get nearer the content; the one, necessity, has to get filled with it, the other, the language of the minstrel, must have a share in it. And the content formerly left to itself must acquire in itself the certainty and the fixed character of the negative.

This higher language, that of *Tragedy,* gathers and keeps more closely together the dispersed and scattered moments of the inner essential world and the world of action. The substance of the divine falls apart, in accordance with the nature of the notion, into its shapes and forms, and their movement is likewise in conformity with that notion. In regard to

form, the language here ceases to be narrative, in virtue of the fact that it enters into the content, just as the content ceases to be merely one that is ideally imagined. The hero is himself the spokesman, and the representation given brings before the audience — who are also spectators — *self-conscious* human beings, who know their own rights and purposes, the power and the will belonging to their specific nature, and who know how to state them. They are artists who do not express with unconscious naïveté and naturalness the merely external aspect of what they begin and what they decide upon, as is the case in the language accompanying ordinary action in actual life; they make the very inner being external, they prove the righteousness of their action, and the "pathos" controlling them is soberly asserted and definitely expressed in its universal individuality, free from all accident of circumstance and the particular peculiarities of personalities. Lastly, it is in actual human beings that these characters get existence, human beings who impersonate the heroes, and represent them in actual speech, not in the form of a narrative, but speaking in their own person. Just as it is essential for a statue to be made by human hands, so is the actor essential to his mask — not as an external condition, from which, artistically considered, we have to abstract; or so far as abstraction must certainly be made, we thereby state just that art does not yet contain in it the true and proper self.

The general ground, on which the movement of these shapes produced from the notion takes place, is the consciousness expressed in the imaginative language of the Epic, where the detail of the content is loosely spread out with no unifying self. It is the commonalty in general, whose wisdom finds utterance in the Chorus of the Elders; in the powerlessness of this chorus the generality finds its representative, because the common people itself compose merely the positive and passive material for the individuality of the government confronting it. Lacking the power to negate

and oppose, it is unable to hold together and keep within bounds the riches and varied fullness of divine life; it allows each individual moment to go off its own way, and in its hymns of honour and reverence praises each individual moment as an independent god, now this god and now again another. Where, however, it detects the seriousness of the notion, and perceives how the notion marches onward shattering these forms as it goes along; and where it comes to see how badly its praised and honoured gods come off when they venture on the ground where the notion holds sway; — there it is not itself the negative power interfering by action, but keeps itself within the abstract selfless thought of such power, confines itself to the consciousness of alien and external destiny, and produces the empty wish to tranquillize, and feeble ineffective talk intended to appease. In its terror before the higher powers, which are the immediate arms of the substance; in its terror before their struggle with one another, and before the simple self of that necessity, which crushes them as well as the living beings bound up with them; in its compassion for these living beings, whom it knows at once to be the same with itself — it is conscious of nothing but ineffective horror of this whole process, conscious of equally helpless pity, and, as the end of all, the mere empty peace of resignation to necessity, whose work is apprehended neither as the necessary act of the character, nor as the action of the absolute Being within itself.

Spirit does not appear in its dissociated multiplicity on the plane of this onlooking consciousness [the chorus], the indifferent ground, as it were, on which the presentation takes place; it comes on the scene in the simple diremption of the notion. Its substance manifests itself, therefore, merely torn asunder into its two extreme powers. These elementary universal beings are, at the same time, self-conscious individualities — heroes who put their conscious life into one of these powers, find therein determinateness of character, and constitute the effective activity and reality

of these powers. This universal individualization descends again, as will be remembered, to the immediate reality of existence proper, and is presented before a crowd of spectators, who find in the chorus their image and counterpart, or rather their own thought giving itself expression.

The content and movement of the spirit, which is, object to itself here, have been already considered as the nature and realization of the substance of ethical life. In its form of religion spirit attains to consciousness about itself, or reveals itself to its consciousness in its purer form and its simpler mode of embodiment. If, then, the ethical substance by its very principle broke up, as regards its content, into two powers — which were defined as divine and human law, law of the nether world and law of the upper world, the one the family, the other state sovereignty, the first bearing the impress and character of woman, the other that of man — in the same way, the previously multiform circle of gods, with its wavering and unsteady characteristics, confines itself to these powers, which owing to this feature are brought closer to individuality proper. For the previous dispersion of the whole into manifold abstract forces, which appear hypostatized, is the dissolution of the subject which comprehends them merely as moments in its self; and individuality is therefore only the superficial form of these entities. Conversely, a further distinction of characters than that just named is to be reckoned as contingent and inherently external personality.

At the same time, the essential nature [in the case of ethical substance] gets divided in its form, i.e. with respect to knowledge. Spirit when acting, appears, *qua* consciousness, over against the object on which its activity is directed, and which, in consequence, is determined as the negative of the knowing agent. The agent finds himself thereby in the opposition of knowing and not knowing. He takes his purpose from his own character, and knows it to be essential ethical fact; but owing to the determinateness of his character, he knows merely the one power of substance; the other

remains for him concealed and out of sight. The present reality, therefore, is one thing in itself, and another for consciousness. The higher and lower right come to signify in this connexion the power that knows and reveals itself to consciousness, and the power concealing itself and lurking in the background. The one is the aspect of light, the god of the Oracle, who as regards its natural aspect [Light] has sprung from the all-illuminating Sun, knows all and reveals all, Phœbus and Zeus, who is his Father. But the commands of this truth-speaking god, and his proclamations of what *is*, are really deceptive and fallacious. For this knowledge is, in its very principle, directly *not* knowledge, because consciousness in acting is inherently this opposition. He, who had the power to unlock the riddle of the sphinx, and he too who trusted with childlike confidence, are, therefore, both sent to destruction through what the god reveals to them. The priestess, through whose mouth the beautiful god speaks, is in nothing different from the equivocal sisters of fate, who drive their victim to crime by their promises, and who, by the double-tongued, equivocal character of what they gave out as a certainty, deceive the King when he relies upon the manifest and obvious meaning of what they say. There is a type of consciousness that is purer than the latter which believes in witches, and more sober, more thorough, and more solid than the former which puts its trust in the priestess and the beautiful god. This type of consciousness, therefore, lets his revenge tarry for the revelation which the spirit of his father makes regarding the crime that did him to death, and institutes other proofs in addition — for the reason that the spirit giving the revelation might possibly be the devil.

This mistrust has good grounds, because the knowing consciousness takes its stand on the opposition between certainty of itself on the one hand, and the objective essential reality on the other. Ethical rightness, which insists that actuality is nothing *per se* in opposition to absolute law, finds out that its knowledge is onesided, its law merely a law of its own character,

and that it has laid hold of merely one of the powers of the substance. The act itself is this inversion of what is known into its opposite, into objective existence, turns round what is right from the point of view of character and knowledge into the right of the very opposite with which the former is bound up in the essential nature of the substance — turns it into the "Furies" who embody the right of the other power and character awakened into hostility. The lower right sits with Zeus enthroned, and enjoys equal respect and homage with the god revealed and knowing.

To these three supernatural Beings the world of the gods of the chorus is limited and restricted by the acting individuality. The one is the substance, the power presiding over the hearth and home and the spirit worshipped by the family, as well as the universal power pervading state and government. Since this distinction belongs to the substance as such, it is, when dramatically presented, not individualized in two distinct shapes [of the substance], but has in actual reality the two persons of its characters. On the other hand, the distinction between knowing and not knowing falls within each of the actual self-consciousnesses; and only in abstraction, in the element of universality, does it get divided into two individual shapes. For the self of the hero only exists as a whole consciousness, and hence includes essentially the whole of the distinction belonging to the form; but its substance is determinate, and only one side of the content distinguished belongs to him. Hence the two sides of consciousness, which have m concrete reality no separate individuality peculiarly their own, receive, when ideally represented, each its own particular form: the one that of the god revealed, the other that of the Furies keeping themselves concealed. In part both enjoy equal honour, while again, the form assumed by the substance, Zeus, is the necessity of the relation of the two to one another. The substance is the relation that knowledge is for itself, but finds its truth in what is simple; that the distinction, through and in which actual

consciousness exists, has its basis in that inner being which destroys it; that the clear conscious assurance of certainty has its confirmation in forgetfulness.

Consciousness disclosed this opposition by action, through doing something. Acting in accordance with the knowledge revealed, it, finds out the deceptiveness of that knowledge, and being committed, as regards its inner nature., to one of the attributes of substance, it did violence to the other and thereby gave the latter right as against itself. When following that god who knows and reveals himself, it really seized hold of what is not revealed, and pays the penalty for having trusted the knowledge, whose equivocal character (since this is its very nature) it also had to discover, and an admonition thereanent to be given. The frenzy of the priestess, the inhuman shape of the witches, the voices of trees and birds, dreams, and so on, are not ways in which truth appears; they are admonitory signs of deception, of want of judgment, of the individual and accidental character of knowledge. Or, what comes to the same thing, the opposite power, which consciousness has violated, is present as express law and authentic right, whether law of the family or law of the state; while consciousness, on the other hand, pursued its own proper knowledge, and hid from itself what was revealed. The truth, however, of the opposing powers of content and consciousness is the final result, that both are equally right, and, hence, in their opposition (which comes about through action) are equally wrong. The process of action proves their unity in the mutual overthrow of both powers and both self-conscious characters. The reconciliation of the opposition with itself is the Lethe of the nether world in the form of Death-or the Lethe of the upper world in the form of absolution, not from guilt (for consciousness cannot deny its guilt, because the act was done), but from the crime, and in the form of the peace of soul which atones for the crime. Both are forgetfulness, the disappearance of the reality and action of the powers

of the substance, of their component individualities, and of the powers of the abstract thought of good and evil. For none of them by itself is the real essence: this consists in the undisturbed calm of the whole within itself, the immovable unity of Fate, the quiescent existence (and hence want of activity and vitality) of the family and government, and the equal honour and consequent indifferent unreality of Apollo and the Furies, and the return of their spiritual life and activity into Zeus solely and simply.

This destiny completes the depopulation of Heaven-of that unthinking blending of individuality and. ultimate Being — a blending whereby the action of this absolute Being appears as something incoherent, contingent, unworthy of itself; for individuality, when attaching in a merely superficial way to absolute Being, is unessential. The expulsion of such unreal insubstantial ideas, which was demanded by the philosophers of antiquity, thus already has its beginning in tragedy in general, through the fact that the division of the substance is controlled by the notion, and hence individuality is the essential individuality, and the specific determinations are absolute characters. The self-consciousness represented in tragedy knows and acknowledges on that account only one highest power, Zeus. This Zeus is known and acknowledged only as the power of the state or of the hearth and home, and, in the opposition belonging to knowledge, merely as the Father of the knowledge of the particular — a knowledge assuming a figure in the drama: — and again as the Zeus of the oath and of the Furies, the Zeus of what is universal, of the inner being dwelling in concealment. The further moments taken from the notion (*Begriff*) and dispersed in the form of ideal presentation (*Vorstellung*), moments which the chorus permits to hold good one after the other, are, on the other hand, not the “pathos” of the hero; they sink to the level of passions in the hero — to the level of accidental, insubstantial moments, which the impersonal chorus no doubt praises, but

which are not capable of constituting the character of heroes, nor of being expressed and revered by them as their real nature.

But, further, the persons of the divine Being itself, as well as the characters of its substance, coalesce into the simplicity of what is devoid of consciousness. This necessity has, in contrast to self-consciousness, the characteristic of being the negative power of all the shapes that appear, a power in which they do not recognize themselves, but perish therein. The self appears as merely allotted amongst the different characters, and not as the mediating factor of the process. But self-consciousness, the simple certainty of self, is in point of fact the negative power, the unity of Zeus, the unity of the substantial essence and abstract necessity; it is the spiritual unity into which everything returns. Because actual self-consciousness is still distinguished from the substance and fate, it is partly the chorus, or rather the crowd looking on, whom this movement of the divine life fills with fear as being something alien and strange, or in whom this movement, as something closely touching themselves, produces merely the emotion of passive pity. Partly again, so far as consciousness co-operates and belongs to the various characters, this alliance is of an external kind, is a hypocrisy — because the true union, that of self, fate, and substance, is not yet present. The hero, who appears before the onlookers, breaks up into his mask and the actor, into the person of the play and the actual self.

The self-consciousness of the heroes must step forth from its mask and be represented as knowing itself to be the fate both of the gods of the chorus and of the absolute powers themselves, and as being no longer separated from the chorus, the universal consciousness.

Comedy has, then, first of all, the aspect that actual self-consciousness represents itself as the fate of the gods. These elemental Beings are, *qua* universal moments, no definite self, and are not actual. They are, indeed, endowed with the form of individuality, but this is in their case merely put

on, and does not really and truly belong to them. The actual self has no such abstract moment as its substance and content. The subject, therefore, is raised above such a moment, as it would be above a particular quality, and when clothed with this mask gives utterance to the irony of such a property trying to be something on its own account. The pretentious claims of the universal abstract nature are shown up and discovered in the actual self; it is seen to be caught and held in a concrete reality, and lets the mask drop, just when it wants to be something genuine. The self, appearing here in its significance as something actual, plays with the mask which it once puts on, in order to be its own person; but it breaks away from this seeming and pretence just as quickly again, and comes out in its own nakedness and commonness, which it shows not to be distinct from the proper self, the actor, nor again from the onlooker.

This general dissolution, which the formally embodied essential nature as a whole undergoes when it assumes individuality, becomes in its content more serious, and hence more petulant and bitter, in so far as the content possesses its more serious and necessary meaning. The divine substance combines the meaning of natural and ethical essentiality.

As regards the natural element, actual self-consciousness shows in the very fact of applying elements of nature for its adornment, for its abode and so on, and again in feasting on its own offering, that *itself* is the Fate to which the secret is betrayed, no matter what may be the truth as regards the independent substantialitv of nature. In the mystery of the bread and wine it makes its very owm this self-subsistence of nature together with the significance of the inner reality; and in Comedy it is conscious of the irony lurking in this meaning.

So far, again, as this meaning contains the essence of ethical reality, it is partly the nation in its two aspects of the state, or Demos proper, and individual family life; partly, however, it is self-conscious pure knowledge,

or rational thought of the universal. Demos, the general mass, which knows itself as master and governor, and is also aware of being the insight and intelligence which demand respect, exerts compulsion and is befooled through the particularity of its actual life, and exhibits the ludicrous contrast between its own opinion of itself and its immediate existence, between its necessity and contingency, its universality and its vulgarity. If the principle of its individual existence, cut off from the universal, breaks out in the proper figure of an actual man and openly usurps and administers the commonwealth, to which it is a secret harm and detriment, then there is more immediately disclosed the contrast between the universal in the sense of a theory, and that with which practice is concerned; there stand exposed the entire emancipation of the ends and aims of the mere individual from the universal order, and the scorn the mere individual shows for such order.

Rational thinking removes contingency of form and shape from the divine Being; and, in opposition to the uncritical wisdom of the chorus — a wisdom, giving utterance to all sorts of ethical maxims and stamping with validity and authority a multitude of laws and specific conceptions of duty and of right — rational thought lifts these into the simple Ideas of the Beautiful and the Good. The process of this abstraction is the consciousness of the dialectic involved in these maxims and laws themselves, and hence the consciousness of the disappearance of that absolute validity with which they previously appeared. Since the contingent character and superficial individuality which imagination lent to the divine Beings, vanish, they are left, as regards their natural aspect, with merely the nakedness of their immediate existence; they are Clouds, a passing vapour, like those imaginative ideas. Having passed in accordance with their essential character, as determined by thought, into the simple thoughts of the Beautiful and the Good, these latter submit to being filled with every kind of content. The force of dialectic knowledge puts determinate laws and

maxims of action at the mercy of the pleasure and levity of youth, led astray therewith, and gives weapons of deception into the hands of solicitous and apprehensive old age, restricted in its interests to the individual details of life. The pure thoughts of the Beautiful and the Good thus display a comic spectacle: — through their being set free from the opinion, which contains both their determinateness in the sense of content and also their absolute determinateness, the firm hold of consciousness upon them, they become empty, and, on that very account, the sport of the private opinion and caprice of any chance individuality.

Here, then, the Fate, formerly without consciousness, consisting in empty rest and forgetfulness, and separated from self-consciousness, is united with self-consciousness. The individual self is the negative force through which and in which the gods, as also their moments, (nature as existent fact and the thoughts of their determinate characters), pass away and disappear. At the same time, the individual self is not the mere vacuity of disappearance, but preserves itself in this very nothingness, holds to itself and is the sole and only reality. The religion of art is fulfilled and consummated in it, and is come full circle. Through the fact that it is the individual consciousness in its certainty of self which manifests itself as this absolute power, this latter has lost the form of something ideally presented (*vorgestellt*), separated from and alien to consciousness in general — as were the statue and also the living embodiment of beauty or the content of the Epic and the powers and persons of Tragedy. Nor again is the unity the unconscious unity of the cult and the mysteries; rather the self proper of the actor coincides with the part he impersonates, just as the onlooker is perfectly at home in what is represented before him, and sees himself playing in the drama before him. What this self-consciousness beholds, is that whatever assumes the form of essentiality as against self-consciousness, is instead dissolved within it — within its thought, its

existence and action — and is quite at its mercy. It is the return of everything universal into certainty of self, a certainty which, in consequence, is this complete loss of fear of everything strange and alien, and complete loss of substantial reality on the part of what is alien and external. Such certainty is a state of spiritual good health and of self-abandonment thereto, on the part of consciousness, in a way that, outside this kind of comedy, is not to be found anywhere.

C

Revealed Religion

THROUGH the Religion of Art spirit has passed from the form of substance into that of Subject; for art brings out its shape and form, and imbues it with the nature of action, or establishes in it the self-consciousness which merely disappears in the awesome substance and in the attitude of simple trust does not itself comprehend itself. This incarnation in human form of the Divine Being begins with the statue, which has in it only the outward shape of the self, while the inner life thereof, its activity, falls outside it. In the case of the cult, however, both aspects have become one; in the outcome of the religion of art this unity, in being completely attained, has at the same time also passed over to the extreme of self; in the spirit, which is perfectly certain of itself in the individual existence of consciousness, all essential content is swallowed up and submerged. The proposition, which gives this light-hearted folly expression, runs thus: "The Self is Absolute Being." The Being which was substance, and in which the self was the accidental element, has dropped to the level of a predicate; and in this self-consciousness, over against which nothing appears in the form of objective Being, spirit has lost its aspect of consciousness.

This proposition, “The Self is Absolute Being”, belongs, as is evident on the face of it, to the non-religious, the concrete actual spirit; and we have to recall what form of spirit it is which gives expression to it. This form will contain at once the movement of that proposition and its conversion, which lowers the self to a predicate and raises substance into subject. This we must understand to take place in such a way that the converse statement does not *per se,* or for us, make substance into subject, or, what is the same thing, does not reinstate substance again so that the consciousness of spirit is carried back to its commencement in natural religion; but rather in such a way that this conversion is brought about *for* and *through* self-consciousness itself. Since this latter *consciously* gives itself up, it is preserved and maintained in thus relinquishing itself, and remains the subject of the substance; but as being likewise *self*-relinquished, it has at the same time the consciousness of this substance. In other words, since, by thus offering itself up, it produces substance as subject, this subject remains its own very self. If, then, taking the two propositions, in the first the subject merely disappears in substantiality, and in the second the substance is merely a predicate, and both sides are thus present in each with contrary inequality of value — the result hereby effected is that the union and transfusion of both natures [subject and substance] become apparent. In this union both, with equal value and worth, are at once essential and also merely moments. Hence it is that spirit is equally consciousness of itself as its *objective* substance, as well as simple self-contained self-consciousness.

The religion of art belongs to the spirit animating the ethical sphere, the spirit which we formerly saw sink and disappear in the condition of right, i.e. in the proposition: “The self as such, the abstract person, is absolute Being.” In ethical life the self is absorbed in the spirit of its nation, it is universality filled to the full. Simple abstract individuality, however, rises out of this content, and its lightheartedness clarifies and rarifies it till it

becomes a “person” and attains the abstract universality of right. Here the substantial reality of the ethical spirit is lost, the abstract insubstantial spirits of national individuals are gathered together into a pantheon; not into a pantheon represented in idea (*Vorstellung*), whose impotent form lets each alone to do as it likes, but into the pantheon of abstract universality, of pure thought, which disembodies them, and bestows on the spiritless self, on the individual person, complete existence on its own account.

But this self, through its being empty, has let the content go; this consciousness is Being merely within itself. Its own existence, the legal recognition of the person, is an unfulfilled empty abstraction. It thus really possesses merely the thought of itself; in other words, as it there exists and knows itself as object, it is something unreal. Consequently, it is merely stoic independence, the independence of thought; and this finds, by passing through the process of scepticism, its ultimate truth in that form we called the “unhappy self-consciousness” — the soul of despair.

This knows how the case stands with the actual claims to validity which the abstract [legal] person puts forward, as also with the validity of this person in pure thought [in Stoicism]. It knows that a vindication of such validity means really being altogether lost; it is just this loss become conscious of itself, and is the surrender and relinquishment of its knowledge about itself. We see that this “unhappy consciousness” constituted the counterpart and the complement of the perfectly happy consciousness, that of comedy. All divine reality goes back into this latter type of consciousness; it means, in other words, the complete relinquishment and emptying of substance. The former, on the contrary, is conversely the tragic fate that befalls certainty of self which aims at being absolute, at being self-sufficient. It is consciousness of the loss of everything of significance in this certainty of itself, and of the loss even of this knowledge or certainty of

self-the loss of substance as well as of self; it is the bitter pain which finds expression in the cruel words, “God is dead”.

In the condition of right or law, then, the ethical world has vanished, and its type of religion has passed away in the mood of Comedy. The “unhappy consciousness” the soul of despair, is just the knowledge of all this loss. It has lost both the worth and dignity it attached to its immediate personality [as a legal person] as well as that attaching to its personality when reflected in the medium of thought [in the case of Stoicism]. Trust in the eternal laws of the Gods is likewise silenced, just as the oracles are dumb, who pretended to know what to do in particular cases. The statues set up are now corpses in stone whence the animating soul has flown, while the hymns of praise are words from which all belief has gone. The tables of the gods are bereft of spiritual food and drink, and from his games and festivals man no more receives the joyful sense of his unity with the divine Being. The works of the muse lack the force and energy of the spirit which derived the certainty and assurance of itself just from the crushing ruin of gods and men. They are themselves now just what they are for us — beautiful fruit broken off the tree; a kindly fate has passed on those works to us, as a maiden might offer such fruit off a tree. Their actual life as they exist is no longer there, not the tree that bore them, not the earth, and the elements, which constituted their substance, nor the climate that determined their constitutive character, nor the change of seasons which controlled the process of their growth. So too it is not their living world that Fate preserves and gives us with those works of ancient art, not the spring and summer of that ethical life in which they bloomed and ripened, but the veiled remembrance alone of all this reality. Our action, therefore, when we enjoy them is not that of worship, through which our conscious life might attain its complete truth and be satisfied to the full: our action is external; it consists in wiping off some drop of rain or speck of dust from these fruits,

and in place of the inner elements composing the reality of the ethical life, a reality that environed, created and inspired these works, we erect in prolix detail the scaffolding of the dead elements of their outward existence — language, historical circumstances, etc. All this we do, not in order to enter into their very life, but only to represent them ideally or pictorially (*vorstellen*) within ourselves. But just as the maiden who hands us the plucked fruits is more than the nature which presented them in the first instance — the nature which provided all their detailed conditions and elements, tree, air, light, and so on — since in a higher way she gathers all this together into the light of her self-conscious eye, and her gesture in offering the gifts; so too the spirit of the fate, which presents us with those works of art, is more than the ethical life realized in that nation. For it is the *inwardizing* in *us*, in the form of conscious memory (*Er-Innerung*), of the spirit which in them was manifested in a still *external* way; — it is the spirit of the tragic fate which collects all those individual gods and attributes of the substance into the one Pantheon, into the spirit which is itself conscious of itself as spirit.

All the conditions for its production are present, and this totality of its conditions constitutes the development of it, its notion, or the inherent production of it. The cycle of the creations of art embraces in its scope all forms in which the absolute substance relinquishes itself. The absolute substance is in the form of individuality as a thing; as an object existing for sense experience; as pure language, or the process of that form whose existence does not get away from the self, and is a purely evanescent object; as immediate unity with universal self-consciousness when inspired with enthusiasm; as mediated unity when performing the acts of the cult; as corporeal embodiment of the self in a form of beauty; and finally as existence lifted into ideal representation (*Vorstellung*) and the expansion of this existence into a world which at length gathers its content together into

universality, a universal which is at the same time pure certainty and assurance of itself. These forms, and, on the other side, the world of personality and legal right, the wild and desert waste of content with its constituent elements set free and detached, as also the thought-constituted personality of Stoicism, and the unresting disquiet of Scepticism — these compose, the periphery of the circle of shapes and forms, which attend., an expectant and eager throng, round the birthplace of spirit as it becomes self-consciousness. Their centre is the yearning agony of the unhappy despairing self-consciousness, a pain which permeates all of them and is the common birthpang at its production — the simplicity of the pure notion, which contains those forms as its moments.

Spirit, here, has in it two sides, which are above represented as the two converse propositions: one is this, that substance empties itself of itself, and becomes self-consciousness; the other is the converse, that self-consciousness empties itself of itself and makes itself into the form of "thing", or makes itself universal self. Both sides have in this way met each other, and in consequence, their true union has arisen. The relinquishment or "kenosis" on the part of the substance, its becoming self-consciousness, expresses the transition into the opposite, the unconscious transition of necessity, in other words, that it is *implicitly* self-consciousness. Conversely, the emptying of self-consciousness expresses this, that implicitly it is Universal Being, or — because the self is pure self-existence, which is at home with itself in its opposite-that the substance is self-consciousness explicitly *for the self,* and, just on that account, is spirit. Of this spirit, which has left the form of substance behind, and enters existence in the shape of self-consciousness, we may say, therefore-if we wish to use terms drawn from the process of natural generation — that it has a real mother but a potential or an implicit father. For actual reality, or self-consciousness, and implicit being in the sense of substance are its two moments; and by the

reciprocity of their kenosis, each relinquishing or "emptying" itself of itself and becoming the other, spirit thus comes into existence as their unity.

In so far as self-consciousness in a one-sided way grasps only, its *own* relinquishment, although its object is thus f or it at once both existence and self and it knows all existence to be spiritual in nature, yet true spirit has not become thereby objective for it. For, so far, being in general or substance, would not essentially *from its side* be also emptied of itself, and become self-consciousness. In that case, then, all existence is spiritual reality merely from the standpoint of consciousness, not inherently in itself. Spirit in this way has merely a fictitious or imaginary existence. This imagination is fantastic extravagance of mind, which introduces into nature as well as history, the World and the mythical ideas of early religions, another inner esoteric meaning different from what they, on the face of them, bear directly to consciousness, and, in particular, in the case of religions, another meaning than the self-consciousness, whose religions they were, actually knew to be there. But this meaning is one that is borrowed, a garment, which does not cover the nakedness of the outer appearance, and secures no belief and respect; it is no more than murky darkness and a peculiar crazy contortion of consciousness.

If then this meaning of the objective is not to be bare fancy and imagination, it must be inherent and essential (*an sich*), i.e. must in the first place arise in consciousness as springing from the very notion, and must come forth in its necessity. It is thus that self-knowing spirit has arisen; it has arisen through the knowledge of immediate consciousness, i.e. of consciousness of the existing object, by means of its necessary process. This notion, which, being immediate, had also, for its consciousness, the shape of immediacy, has, in the second place, taken on the form of self-consciousness essentially and inherently, i.e. by just the same necessity of the notion by which being or immediacy, the abstract object of self-

consciousness, renounces itself and becomes, for consciousness, Ego. The immediate entity (*Ansich*), or [objectively] *existent* necessity, is, however, different from the [subjective] thinking entity, or the *knowledge* of necessity — a distinction which, at the same time, does not lie outside the notion, for the simple unity of the notion is itself immediate being. The notion is at once what empties or relinquishes itself, or the explicit unfolding of directly apprehended (*angeschaut*) necessity, and is also at home with itself in that necessity, knows it and comprehends it. The immediate inherent nature of spirit, which takes on the form of self-consciousness, means nothing else than that the concrete *actual world-spirit* has reached this *knowledge* of itself. It is then too that this knowledge first enters its consciousness, and enters it as truth. How that came about has already been explained.

That Absolute Spirit has taken on the shape of self-consciousness inherently, and therefore also consciously to itself — this appears now as the belief of the world, the belief that spirit exists *in fact* as a definite self-consciousness, i.e. as an actual human being; that spirit is an object for immediate experience; that the believing mind *sees, feels, and hears* this divinity. Taken thus it is not imagination, not a fancy; it is actual in the believer. Consciousness in that case does not set out from its own inner life, does not start from thought, and in itself combine the thought of God with existence; rather it sets out from immediate present existence, and recognizes God in it.

The moment of immediate existence is present in the content of the notion, and present in such a way that the religious spirit, on the return of all ultimate reality into consciousness, has become simple positive self, just as the actual spirit as such, in the case of the "unhappy consciousness", was just this simple self-conscious negativity. The self of the existent spirit has in that way the form of complete immediacy. It is neither set up as something thought, or imaginatively represented, nor as something

produced, as is the case with the immediate self in natural religion, or again in religion as art. Rather, this concrete God is beheld sensuously I and immediately as a self, as a real individual human being, only so is it a self-consciousness.

This incarnation of the Divine Being, its having essentially and directly the shape of self-consciousness, is the simple content of Absolute Religion. Here the Divine Being is known as Spirit; this religion is the Divine Being's consciousness concerning itself that it is Spirit. For spirit is knowledge of self in a state of alienation of self: spirit is the Being which is the process of retaining identity with itself in its otherness. This, however, is Substance, so far as in its accidents substance at the same time is turned back into itself; and is so, not as being indifferent towards something unessential and, consequently, as finding itself in some alien element, but as being there within itself, i.e. so far as it is subject or self.

In this form of religion the Divine Being is, on that account, revealed. Its being revealed obviously consists in this, that what it is, is known. It is, however, known just in its being known as spirit, as a Being which is essentially self-consciousness.

There is something in its object concealed from consciousness if the object is for consciousness an "other", or something alien, and if consciousness does not know the object as its self. This concealment, this secrecy, ceases when the Absolute Being *qua* spirit is object of consciousness. For here in its relation to consciousness the object is in the form of self; i.e. consciousness immediately knows itself there, or is manifest, revealed, to itself in the object. Itself is manifest to itself only in its own certainty of self; the object it has is the self; self, however, is nothing alien and extraneous, but inseparable unity with itself, the *immediately universal*. It is the pure notion, pure thought, or self-existence, (being-for-self), which is immediately *being*, and, therewith, being-for-

another, and, *qua* this being-for-another, is immediately turned back into itself and is at home with itself (*bei sich*). It is thus the truly and solely revealed. The Good, the Righteous, the Holy, Creator of Heaven and Earth, etc. — all these are predicates of a subject, universal moments, which have their support on this central point, and only *are* when consciousness goes back into thought.

As long as it is *they* that are known, their ground and essential being, the Subject itself, is not yet revealed; and in the same way the specific determinations of the universal are not this universal itself. The Subject itself, and consequently this pure universal too, is, however, revealed as self; for this self is just this inner being reflected into itself, the inner being which is immediately given and is the proper certainty of that self, for which it is given. To be in its notion that which reveals and is revealed — this is, then, the true shape of spirit; and moreover, this shape, its notion, is alone its very essence and its substance. Spirit is known as self-consciousness, and to this self-consciousness it is directly revealed, for it is this self-consciousness itself. The divine nature is the same as the human, and it is this unity which is intuitively apprehended (*angeschaut*).

Here, then, we find as a fact consciousness, or the general form in which Being is aware of Being — the shape which Being adopts — to be identical with its self-consciousness. This shape is itself a self-consciousness; it is thus at the same time an existent object; and this existence possesses equally directly the significance of pure thought, of Absolute Being.

The absolute Being existing as a concrete actual self-consciousness, seems to have descended from its eternal pure simplicity; but in fact it has, in so doing, attained for the first time its highest nature, its supreme reach of being. For only when the notion of Being has reached its simple purity of nature, is it *both* the absolute abstraction, which is pure thought and hence

the pure singleness of self, *and* immediacy or objective being, on account of its simplicity.

What is called sense-consciousness is just this pure abstraction; it is this kind of thought for which being is the immediate. The lowest is thus at the same time the highest: the revealed which has come forth entirely to the surface is just therein the deepest reality. That the Supreme Being is seen, heard, etc., as an existent self-consciousness this is, in very truth, the culmination and consummation of its notion. And through this consummation, the Divine Being is given and exists immediately in its character as Divine Being.

This immediate existence is at the same time not solely and simply immediate consciousness; it is *religious* consciousness. This immediacy means not only an existent self-consciousness, but also the purely thought-constituted or Absolute Being; and these meanings are inseparable. What we [the philosophers] are conscious of in our conception — that objective being is ultimate essence — is the same as what the religious consciousness is aware of. This unity of being and essence, of thought which is immediately existence, is immediate knowledge on the part of this religious consciousness just as it is the inner thought or the mediated reflective knowledge of this consciousness. For this unity of being and thought is self-consciousness and actually exists; in other words, the thought-constituted unity has at the same time this concrete shape and form of what it is. God, then, is here revealed, as He is; He actually exists as He is in Himself; He is real as Spirit. God is attainable in pure speculative knowledge alone, and only *is* in that knowledge, and is merely that knowledge itself, for He is spirit; and this speculative knowledge is the knowledge furnished by revealed religion. That knowledge knows God to be thought, or pure Essence; and knows this thought as actual being and as a real existence, and

existence as the negativity of itself, hence as Self, an individual “this” and a universal self. It is just this that revealed religion knows.

The hopes and expectations of preceding ages pressed forward to, and were solely directed towards this revelation, the vision of what Absolute Being is, and the discovery of themselves therein. This joy, the joy of seeing itself in Absolute Being, becomes realized in self-consciousness, and seizes the whole world. For the Absolute is Spirit, it is the simple movement of those pure abstract moments, which expresses just this-that Ultimate Reality is then, and not till then, known as Spirit when it is seen and beheld as immediate self-consciousness.

This conception of spirit knowing itself to be spirit, is still the immediate notion; it is not yet developed. The ultimate Being is spirit; in other words, it has appeared, it is revealed. This first revelation is itself immediate; but the immediacy is likewise thought, or pure mediation, and must therefore exhibit and set forth this moment in the sphere of immediacy as such.

Looking at this more precisely, spirit, when self-consciousness is immediate, is “this” individual self-consciousness set up in contrast to the universal self-consciousness. It is a one, an excluding unit, which appears to that consciousness, for which it exists, in the as yet impervious form of a sensuous other, an unresolved entity in the sphere of sense. This other does not yet know spirit to be its own; in other words spirit, in its form as an individual self, does not yet exist as equally universal self, as *all* self. Or again, the shape it assumes has not as yet the form of the notion, i.e. of the universal self, of the self which in its immediate actual reality is at once transcended, is thought, universality, without losing its reality in this universality.

The preliminary and similarly immediate form of this universality is, however, not at once the form of thought itself, of the notion as notion; it is the universality of actual reality, it is the “allness”, the collective totality, of

the selves, and is the elevation of existence into the sphere of figurative thought (*Vorstellung*); just as in general, to take a concrete example, the "this" of sense, when transcended, is first of all the "thing" of "perception", and is not yet the "universal" of "understanding".

This individual human being, then, which Absolute Being is revealed to be, goes through in its own case as an individual the process found in sense existence. He is the *immediately* present God; in consequence, His being passes over into His *having been*. Consciousness, for which God is thus sensuously present, ceases to see Him, to hear Him: it *has* seen Him, it *has* heard Him. And it is because it only *has* seen and heard Him, that it first becomes itself spiritual consciousness; or, in other words, He has now arisen in Spirit, as He formerly rose before consciousness as an object existing in the sphere of sense. For, a consciousness which sees and hears Him by sense, is one which is itself merely an immediate consciousness, which has not cancelled and transcended the disparateness of objectivity, has not withdrawn it into pure thought, but knows this objectively presented individual, and not itself, as spirit. In the disappearance of the immediate existence of what is known to be Absolute Being, immediacy acquires its negative moment. Spirit remains the immediate self of actual reality, but in the form of the universal self-consciousness of a religious communion, a self-consciousness which rests in its own proper substance, just as in it this substance is universal subject: it is not the individual subject by himself, but the individual along with the consciousness of the communion, and what he is for this communion is the complete whole of the individual spirit.

The conditions "past" and "distance" are, however, merely the imperfect form in which the immediateness gets mediated or made universal; this is merely dipped superficially in the element of thought, is kept there as a sensuous mode of immediacy, and not made one with the nature of thought itself. It is lifted out of sense merely into the region of pictorial

presentation; for this is the synthetic [external] connexion of sensuous immediacy and its universality or thought.

Pictorial presentation constitutes the characteristic form in which spirit is conscious of itself in this its religious communion. This form is not yet the self-consciousness of spirit which has reached its notion as notion; the mediating process is still incomplete. In this connexion of being and thought, then, there is a defect; spiritual life is still cumbered with an unreconciled diremption into a “here” and a “beyond”. The content is the true content; but all its moments, when placed in the element of mere imaginative presentation, have the character, not of being conceptually comprehended, but of appearing as completely independent aspects, externally related to one another.

In order that the true content may also obtain its true form for consciousness, the latter must necessarily pass to a higher plane of mental development, where the absolute Substance is not intuitively apprehended but conceptually comprehended and where consciousness is *for itself* brought to the level of its self-consciousness;-as this has already taken place objectively or for us [who have analysed the process of experience].

We have to consider this content as it exists in its consciousness. Absolute Spirit is content; that is how it exists in the shape of its truth. But its truth consists not merely in being the substance or the inherent reality of the religious communion; nor again in coming out of this inwardness into the objectivity of imaginative thought; but in becoming concrete actual self, reflecting itself into self, and being *Subject*. This, then, is the process which spirit realizes in its communion; this is its *life*. What this self-revealing spirit is in and for itself, is therefore not brought out by the rich content of its life being, so to say, untwined and reduced to its original and primitive strands, to the ideas, for instance, presented before the minds of the first imperfect religious communion, or even to what the actual human being

[incarnating the Divine Spirit] has spoken. This reversion to the primitive is based on the instinct to get at the notion, the ultimate principle; but it confuses the origin, in the sense of the immediate, existence of the first historical appearance, with the simplicity of the notion. By thus impoverishing the life of spirit, by clearing away the idea of the communion and its action with regard to its idea, there arises, therefore, not the notion, but bare externality and particularity, merely the historical manner in which spirit once upon a time appeared, the soulless recollection of a presumably (*gemeinten*) individual historical figure and its past.

Spirit is content of its consciousness to begin with in the form of pure substance; in other words, it is content of its pure consciousness. This element of thought is the process of descending into existence, or individuality. The middle term between these two is their synthetic connexion, the consciousness of passing into otherness, the process of imaginative presentation as such. The third stage is the return from this presentation and from that otherness; in other words, it is the element of self-consciousness itself.

These three moments constitute the life of spirit. Its resolution in imaginative thought consists in its taking on a determinate mode of being; this determinateness, however, is nothing but one of its moments. Its detailed process thus consists in spreading its nature out in each of its moments as in an element in which it lives: and in so far as each of these spheres completes itself in itself, this reflexion into itself is at the same time the transition into another sphere of its being. Imaginative presentation constitutes the middle term between pure thought and self-consciousness as such, and is merely *one* of the determinate forms. At the same time however, as has been shown, the character belonging to such presentation — that of being "synthetic connexion" — is spread over all these elements and is their common characteristic.

The content itself, which we have to consider, has partly been met with already, as the idea of the "unhappy" and the "believing" consciousness. In the case of the "unhappy" consciousness, however, the content has the characteristic of being produced from consciousness and for which it yearns, a content wherein the spirit can never be satiated nor find rest because the content is not yet its own content inherently and essentially, or in the sense of being its substance. In the case of the "believing" consciousness, again, this content was regarded as the impersonal Being of the World, as the essentially objective content of imaginative thought — a pictorial thinking that seeks to escape the actual world altogether, and consequently has not the certainty of self-consciousness, a certainty which is cut off from it, partly as being conceit of knowledge, partly as being pure insight. The consciousness of the religious communion, on the other hand, possesses the content as its substance, just as the content is the certainty the communion has of its own spirit.

Spirit, represented at first as substance in the element of pure thought, is, thus, primarily the eternal essential Being, simple, self-identical, which does not, however, have this abstract meaning of essential Being, but the meaning of Absolute Spirit. Yet spirit consists, not in being a meaning, not in being the inner, but in being the actual, the real. "Simple eternal essential Being" would, therefore, be spirit merely in empty phrase, if we remained at the level of pictorial thought, and went no further than the expression of "simple eternal essential Being". "Simple essential Being", however, because it is abstraction, is in point of fact the inherently negative, is indeed the negativity of reflective thought, or negativity as found in Being *per se*; i.e. it is absolute distinction from itself, is pure process of becoming its other. *Qua* essential Being, it is merely implicit, or for us: but since this purity of form is just abstraction or negativity, it is *for itself,* it is the self, the notion. It is thus objective; and since pictorial thinking apprehends and

expresses as an event what has just been expressed as the *necessity* of the notion, it will be said that the eternal Being begets for itself an other. But in this otherness it has likewise, *ipso facto,* returned into itself again; for the distinction is distinction in itself, i.e. the distinction is directly distinguished merely from itself, and is thus the unity returned into itself.

There are thus three moments to be distinguished: Essential Being; explicit Self-existence, which is the express otherness of essential Being, and for which that Being is object; and Self-existence or Self-knowledge in that other. The essential Being beholds only itself in its Self-existence, in its objective otherness. In thus emptying itself, in this kenosis, it is merely within itself: the independent Self-existence which excludes itself from essential Being is the knowledge of itself on the part of essential Being. It is the "Word", the Logos, which when spoken empties the speaker of himself, outwardizes him, and leaves him behind emptied, but is as immediately perceived, and only this act of self-perceiving himself is the actual existence of the "Word". Hence, then, the distinctions which are set up are just as immediately resolved as they are made, and are just as directly made as they are resolved, and the truth and the reality consist precisely in this self-closed circular process.

This movement within itself expresses the absolute Being *qua* Spirit. Absolute Being, when not grasped as Spirit, is merely the abstract void, just as spirit which is not grasped as this process is merely an empty word. Since its moments are grasped *purely* as moments, they are notions in restless activity, which are merely in being inherently their own opposite, and in finding their rest in the whole. But the pictorial thought of the religious communion is not this notional thinking; it has the content without its necessity; and instead of the form of the notion it brings into the realm of pure consciousness the natural relations of Father and Son. Since it thus, even when thinking, proceeds by way of figurative ideas, absolute Being is

indeed revealed to it, but the moments of this Being, owing to this [externally] synthetic pictorial thinking, partly fall of themselves apart from one another, so that they are not related to each other through their own very notion, while, partly again, this figurative thinking retreats from the pure object it deals with, and takes up a merely external relation towards it. The object is externally revealed to it from an alien source, and in this thought of Spirit it does not recognize its own self, does not recognize the nature of pure self-consciousness. In so far as the form of figurative thinking and that way of thinking by means of relationships derived from nature have to be transcended, and especially the method of taking the moments of the process, which Spirit is, as isolated immovable substances or subjects, instead of transient moments — this transcendence is to be looked at as a compulsion on the part of the notion, in the way we formerly pointed out when dealing with another aspect. But since it is only an instinct, it mistakes its own real character, rejects the content along with the form, and, what comes to the same thing, degrades the content into a historical imaginative idea and an heirloom handed down by tradition. In this way there is retained and preserved only what is purely external in belief, and the retention of it as something dead and devoid of knowledge; while the inner element in belief has passed away, because this would be the notion knowing itself as notion.

The Absolute Spirit, as pictured in the element of pure essential Being, is not indeed the abstract pure essential Being; rather, just by the fact that this is merely a moment in the life of Spirit, abstract essential Being has sunk to the level of a mere element (in which Spirit lives). The representation of Spirit in this element, however, has inherently the same defect, as regards form, which essential Being as such has. Essential Being is abstraction, and, therefore, the negative of its simplicity, is an *other:* in the same way, Spirit in the element of essential Being is the form of simple unity, which, on that

account, is just as essentially a process of becoming something else. Or, what is the same thing, the relation of the eternal Being to its self-existence, (its objective existence for Itself), is that of pure thought, an immediately simple relation. In this simple beholding of itself in the Other, otherness therefore is not as such set up independently; it is distinction in the way of distinction, in pure thought, is immediately no distinction-a recognition of Love, where lover and beloved are by their very nature not opposed to each other at all. Spirit, which is expressed in the element of pure thought, is essentially just this: not to be merely in that element, but to be *concrete*, *actual*; for otherness itself, i.e. cancelling and superseding its own pure thought-constituted notion, lies in the very notion of Spirit.

The element of pure thought, because it is an abstract element, is itself rather the other of its own simplicity, and hence passes over into the proper element of imagination — the element where the moments of the pure notion at once acquire a substantial existence in opposition to each other and are subjects as well, which do not exist in indifference towards each other, merely for a third, but, being reflected into themselves, break away from one another and stand confronting each other.

Merely eternal, or *abstract* Spirit, then, becomes an other to itself: it enters existence, and, in the first instance, enters *immediate* existence. It creates a World. This “Creation” is the word which pictorial thought uses to convey the notion itself in its absolute movement; or to express the fact that the simple which has been expressed as absolute, or pure thought, just because it is abstract, is really the negative, and hence opposed to itself, *the other* of itself; or because, to state the same in yet another way, what is put forward as essential Being is simple immediacy, bare existence, but *qua* immediacy or existence, is without Self, and, lacking thus inwardness, is passive, or exists *for* another. This existence for another is at the same time a world. Spirit, in the character of existing for another, is the undisturbed

separate subsistence of those moments formerly enclosed within pure thought, is, therefore, the dissolution of their simple universality, and their dispersion into their own particularity.

The world, however, is not merely Spirit thus thrown out and dispersed into the plenitude of existence and the external order imposed on it; for since Spirit is essentially the simple Self, this self is likewise present therein. The world is objectively existent spirit, which is *individual* self, that has consciousness and distinguishes itself as other, as world, from itself. In the way this individual self is thus immediately established at first it is not yet conscious of being Spirit; it thus does not exist as Spirit; it may be called "innocent", but not strictly "good". In order that in fact it may be self and Spirit, it has first to become objectively an other to itself, in the same way that the Eternal Being manifests itself as the process of being self-identical in its otherness. Since this spirit is determined as yet only as immediately existing, or dispersed into the diverse multiplicity of its conscious life, its becoming "other" means that knowledge concentrates itself upon itself. Immediate existence turns into thought, or merely sense-consciousness turns round into consciousness of thought; and, moreover, because that thought has come from immediacy or is conditioned thought, it is not pure knowledge, but thought which contains otherness, and is, thus, the self-opposed thought of good and evil. Man is pictorially represented by the religious mind in this way: it happened once as an event, with no necessity about it, that he lost the form of harmonious unity with himself by plucking the fruits of the tree of the knowledge of good and evil, and was driven from the state of innocence, from Paradise, from the garden with all its creatures, and from nature offering its bounties without man's toil.

Since this self-concentration on the part of the existent consciousness has straightway the character of becoming discordant with itself, Evil appears as the first actual expression of the self-concentrated consciousness. And

because the thoughts of good and evil are utterly opposed, and this opposition is not yet broken down, this consciousness is essentially and merely evil. At the same time, however, owing to just this very opposition, there is present also the good consciousness opposing the one that is evil, and again their relation to each other. In so far as immediate existence turns round into thought, and self-concentration is partly itself thought, while partly again the transition to otherness on the part of the inner self (*Wesen*), is thereby more precisely determined — the fact of becoming evil can be removed further backwards away out of the actually existing world and transferred to the very earliest realm of thought. It may thus be said that it was the very first-born Son of Light [Lucifer] who, by becoming self-concentrated, fell, but that in his place another was at once created. Such a form of expression as "fallen", belonging merely to figurative thought, and not to the notion, just like the term "Son", either (we may say) transmutes and lowers the moments of the notion to the level of imaginative thought, or transfers pictures ‘into the realm of thought.

In the same way, it is matter of indifference to coordinate a multiplicity of other shapes and forms with the simple thought of otherness in the Being of the Eternal, and transfer to them that condition of self-concentration. This co-ordination must, all the same, win approval, for the reason that, through it, this moment of otherness does express diversity, as it should do: not indeed as plurality in general, but as determinate diversity, so that one part is the Son, that which is simple and knows itself to be essential Being, while the other part is the abandonment, the emptying, of self-existence, and merely lives to praise that Being. To this part may then also be assigned the resumption once again of the self-existence relinquished, and that "self-centredness" characteristic of evil. In so far as this condition of otherness falls into two parts, Spirit might, as regards its moments, be more exactly expressed numerically as a Quaternity, a four in one, or (because the

multiplicity breaks up itself again into two parts, viz. one part which has remained good, the other which has become evil), might even be expressed as a Quinity.

Counting the moments, however, can be regarded as altogether useless, since, for one thing, what is distinguished is itself just as truly one and single — viz. the thought of distinction which is only *one* thought — as the thought is this element distinguished, the second over against the first. For another thing it is useless to count, because the thought which grasps the many in one has to be dissolved out of its universality and must be distinguished into more than three or four distinct components. This universality appears, in contrast to the absolute determinateness of the abstract unit-the principle of number-as indeterminateness in relation to number as such; so that in this connexion we can speak only of numbers in general, i.e. not of a specific number of distinctions. Hence, in general, it is here quite superfluous to think of number and counting, just as, in other connexions, the bare difference of magnitude and multitude says nothing at all and falls outside conceptual thought.

Good and Evil were the specific distinctions of thought which we found. Since their opposition is not yet broken down, and they are represented as essential realities of thought, each of them independent by itself, man is the self with no essential reality of his own and the mere ground which couples them together, and on which they exist and war with one another. But these universal powers of good and evil belong all the same to the self, or the self is their actuality. From this point of view it thus comes about that, as evil is nothing else than the self-concentration of the natural existence of spirit, conversely, good enters into actual reality and appears as an (objectively) existing self-consciousness. That which, when Spirit is interpreted in terms of pure thought, is in general merely hinted at as the Divine Being's transition into otherness, here, for figurative thinking, comes nearer its

realization: the realization is taken to consist in the Divine Being "humbling" Itself, and renouncing its abstract nature and unreality. The other aspect, that of evil, is taken by imagination as an event extraneous and alien to the Divine Being: to grasp evil in the Divine Being itself as the wrath of God-that is the supreme effort, the severest strain, of which figurative thought, wrestling with its own limitations, is capable, an effort which, since it is devoid of the notion, remains a fruitless struggle.

The alienation of the Divine Nature is thus set up in its double-sided form: the self of Spirit, and its simple thought, are the two moments whose absolute unity is Spirit itself. Its alienation with itself consists in the two falling apart from each other, and in the one having an unequal value as against the other. This disparateness is, therefore, twofold in character, and two connexions arise, which have in common the moments just given. In the one, the Divine Being stands for what is essential, while natural existence and the self are unessential and are to be cancelled. In the other, on the contrary, it is self-existence which passes for what is essential and the simply Divine for unessential. Their mediating, though still empty, ground is existence in general, the bare community of their two moments.

The dissolution of this opposition does not take effect through the struggle between the two elements, which are pictured as separate and independent Beings. Just in virtue of their independence each must inherently, through its own notion, dissolve itself in itself. The struggle only takes place where both cease to be this mixture of thought and independent existence, and confront each other merely as thoughts. For there, being determinate notions, they essentially exist merely in the relation of opposition; *qua* independent, on the other hand, they have their essential nature outside their opposition; their movement is thus free, self-determined, and peculiar to themselves. If, then, we consider the movement of both as it is in themselves — i.e. as it is essentially — their movement

starts only in that one of the two which has the character of being inherently essential as contrasted with the other. This is pictured as a spontaneous action; but the necessity for its self-abandonment lies in the notion that what is inherently essential, and gets this specific character merely through opposition, has just on that account no real independent subsistence. Therefore that element which has for its essence, not independent self-existence, but simple being, is what empties and abandons itself, gives itself unto death, and so reconciles Absolute Being with its own self. For in this process it manifests itself as spirit: the abstract Being is estranged from itself, it has natural existence and the reality of an actual self. This its otherness, or its being sensuously present, is taken back again by the second process of becoming "other", and is affirmed as superseded, as universal. Thereby the Divine Being has come to itself in the sphere of the sensuous present; the immediate existence of actual reality has ceased to be something alien or external to the Divine, by being sublated, universal: this death (of immediacy) is therefore its rising anew as spirit. When the self-conscious Being cancels and transcends its immediate present, it is as universal self-consciousness. This notion of the transcended individual self which is Absolute Being, immediately expresses therefore the establishment of a communion which, while hitherto having its abode in the sphere of pictorial thought, now returns into itself as the Self: and Spirit thus passes from the second element constituting it — figurative thought — and goes over to the third-self-consciousness as such.

If we further consider the kind of procedure that pictorial thinking adopts as it goes along, we find in the first place the expression that the Divine Being "takes on" human nature. Here it is *eo ipso* asserted that implicitly and inherently the two are not separate: just as in the statement, that the Divine Being from the beginning empties Itself of Itself, that its objective existence becomes concentrated in Itself and becomes evil, it is not asserted

but implied that *per se* this evil existence is *not* something alien to the Divine nature. Absolute Being would be merely an empty name if in very truth there were any other being external to it, if there were a "fall"' from it. The aspect of self-concentration really constitutes the essential moment of the self of Spirit.

That this self-centredness, whence primarily comes its reality, belongs to the Divine Being — while this is for *us* a notion, and so as far as it *is* a notion — appears to pictorial thinking as an inconceivable happening. The inherent and essential nature assumes for figurative thought the form of an indifferent objective fact. The thought, however, that those apparently mutually repugnant moments, absolute Being and self-existent Self, are not inseparable, comes also before this figurative way of thinking (since it does possess the real content), but that thought appears *afterwards,* in the form that the Divine Being empties Itself of Itself and is made flesh. This figurative idea, which in this manner is still immediate and hence not spiritual, i.e. it knows the human form assumed by the Divine as merely a particular form, not yet as a universal form — becomes spiritual for this consciousness in the process whereby God, who has assumed shape and form, surrenders again His immediate existence, and returns to His essential Being. The essential Being is then Spirit only when it is reflected into itself.

The reconciliation of the Divine Being with its other as a whole, and, specifically, with the *thought* of this other-evil — is thus presented here, in a figurative way. If this reconciliation is expressed *conceptually*, by saying it consists in the fact that evil is inherently the same as what goodness is, or again that the Divine Being is the same as nature in its entire extent, just as nature separated from God is simply nothingness — then this must be looked at as an unspiritual mode of expression which is bound to give rise to misunderstandings. When evil is the *same* as goodness, then evil is just *not* evil nor goodness good; on the contrary, both are really done away with

— evil in general, self-centred self-existence, and goodness, self-less simplicity. Since in this way they are both expressed in terms of their notion, the unity of the two is at once apparent; for self-centred self-existence is simple knowledge; and what is self-less simplicity is similarly pure self-existence centred within itself. Hence, if it must be said that good and evil in this their conception, i.e. so far as they are *not* good and evil, are the same, just as certainly it must be said that they are not the same, but absolutely different; for simple self-existence, or again pure knowledge, are equally pure negativity or per *se* absolute distinction. It is only these two propositions that make the whole complete; and when the first is asserted and asseverated, it must be met and opposed by insisting on the other with immovable obstinacy. Since both are equally right, they are both equally wrong, and their wrong consists in taking such abstract forms as "the same" and "not the same", "identity" and "non-identity", to be something true, fixed, real, and in resting on them. Neither the one nor the other has truth; their truth is just their movement, the process in which simple sameness is abstraction and thus absolute distinction, while this again, being distinction *per se,* is distinguished from itself and so is self-identity. Precisely this is what we have in sameness of the Divine Being and Nature in general and human nature in particular: the former is Nature so far as it is not essential Being; Nature is Divine in its essential Being. But it is in Spirit that we find both abstract aspects affirmed as they truly are, viz. as cancelled and preserved at once: and this way of affirming them cannot be expressed by the judgment, by the soulless word "is", the copula of the judgment. In the same way Nature is nothing outside its essential Being [God]; but this nothing itself *is* all the same; it is absolute abstraction, therefore pure thought or self-centredness, and with its moment of opposition to spiritual unity it is the principle of Evil. The difficulty people find in these conceptions is due solely to sticking to the term "is" and forgetting the

character of thought, where the moments as much *are* as they *are not* — are only the process which is Spirit. It is this spiritual unity — unity where the distinctions are merely in the form of moments, or as transcended — which became known to pictorial thinking in that atoning reconciliation spoken of above. And since this unity is the universality of self-consciousness, self-consciousness has ceased to be figurative or pictorial in its thinking; the Process has turned back into it.

Spirit thus takes up its position in the third element, in universal self-consciousness: Spirit is its own community. The movement of this community being that of self-consciousness, which distinguishes itself from its figurative idea, consists in explicitly bringing out what has implicitly become established. The dead Divine Man, or Human God, is implicitly universal self-consciousness; he has to become explicitly so for this self-consciousness. Or, since this self-consciousness constitutes one side of the opposition involved in figurative thought, viz. the side of evil, which takes natural existence and individual self-existence to be the essential reality — this aspect, which is pictured as independent, and not yet as a moment, has, on account of its independence, to raise itself in and for itself to the level of spirit; it has to reveal the process of Spirit in its self.

This particular self-consciousness is Spirit in natural form, natural spirit: self has to withdraw from this natural existence and enter into itself, become self-centred; that would mean, it has to become evil. But this aspect is already *per se* evil: entering into itself consists therefore, in persuading itself that natural existence is what is evil. By picture-thinking the world is supposed actually to become evil and be evil as an actual fact, and the atoning reconcilement of the Absolute Being is viewed as an actual existent phenomenon. By self-consciousness as such, however, this pictured truth, as regards its form, is considered to be merely a moment that is already superseded and transcended; for the self is the negative, and hence

knowledge — a knowledge which is a pure act of consciousness within itself. This moment of the negative must in like manner find expression in the content. Since, that is to say, the essential Being is inherently and from the start reconciled with itself and is a spiritual unity, in which what are parts for figurative thought are sublated, are moments, what we find is that each part of figurative thought receives here the opposite significance to that which it had before. By this means each meaning finds its completion in the other, and the content is then and thereby a spiritual content. Since the specific determinateness of each is just as much its opposite, unity in otherness — spiritual reality — is achieved: just as formerly we saw the opposite meanings combined objectively (*für uns*), or in themselves, and even the abstract forms of "the same" and "not-the-same", "identity" and "non-identity" cancelled one another and were transcended.

If, then, from the point of view of figurative thought, the becoming self-centred on the part of the natural self-consciousness was actually existing evil, that process of becoming fixed in itself is in the sphere of self consciousness, the *knowledge of evil* as something that *per* se belongs to existence. This knowledge is certainly a process of becoming evil, but merely of the thought of evil, and is therefore recognized as the first moment of reconciliation. For, being a return into self out of the immediacy of nature, which is specifically characterized as evil, it is a forsaking of that immediacy, and a dying to sin. It is not natural existence as such that consciousness forsakes, but natural existence that is at the same time known to be evil. The immediate process of becoming self-centred, is just as much a mediate process: it presupposes itself, i.e. is its own ground and reason: the reason for self-concentrating is because nature has *per se* already done so. Because of evil man must be self-centred (*in sich gehen*); but evil is itself the state of self-concentration. This first movement is just on that account itself merely immediate, is its simple notion, because it is the same

as what its ground or reason is. The movement, or the process of passing into otherness, has therefore still to come on the scene in its own more peculiar form.

Beside this immediacy, then, the mediation of figurative thought is necessary. The knowledge of nature as the untrue existence of spirit, and this universality of self which has arisen within the life of the self — these constitute implicitly the reconciliation of spirit with itself. This implicit state is apprehended by the self-consciousness, that does not comprehend (*begreifen*), in the form of an objective existence, and as something presented to it figuratively. Conceptual comprehension (*Begreifen*), therefore, does not mean for it a grasping (*Ergreifen*) of this conception (*Begriff*) which knows natural existence when cancelled and transcended to be universal and thus reconciled with itself; but rather a grasping of the imaginative idea (*Vorstellung*) that the Divine Being is reconciled with its existence through an event — the event of God's emptying Himself of His Divine Being through His factual Incarnation and His Death. The grasping of this idea now expresses more specifically what was formerly called in figurative thinking spiritual resurrection, or the process by which God's individual self-consciousness becomes the universal, becomes the religious communion. The death of the Divine Man, *qua* death, is abstract negativity, the immediate result of the process which terminates only in the universality belonging to nature. In spiritual self-consciousness death loses this natural significance; it passes into its true conception, the conception just mentioned. Death then ceases to signify what it means directly — the non-existence of *this* individual — and becomes transfigured into the universality of the spirit, which lives in its own communion, dies there daily, and daily rises again.

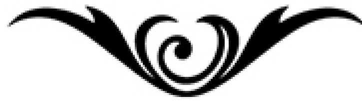
That which belongs to the sphere of pictorial thought — viz., that Absolute Spirit presents the nature of spirit in its existence, *qua* individual

or rather *qua* particular — is thus here transferred to self-consciousness itself, to the knowledge which maintains itself in its otherness. This self-consciousness does not therefore really die, as the particular person is pictorially imagined to have really died; its particularity expires in its universality, i.e. in its *knowledge,* which is essential Being reconciling itself with itself. That immediately preceding element of figurative thinking is thus here affirmed as transcended, has, in other words, returned into the self, into its notion. What was in the former merely an (objective) existent has come to assume the form of *Subject.* By that very fact the first element too, pure thought and the spirit eternal therein, are no longer away beyond the mind thinking pictorially nor beyond the self; rather the return of the whole into itself consists just in containing all moments within itself. When the death of the mediator is grasped by the self, this means the sublation of his factuality, of his particular independent existence: this particular self-existence has become universal self-consciousness.

On the other side, the universal, just because of this, is self-consciousness, and the pure or non-actual Spirit of bare thought has become actual. The death of the mediator is death not merely of his *natural* aspect, of his particular self-existence: what dies is not merely the outer encasement, which, being stripped. of essential Being, is *eo ipso* dead, but also the abstraction of the Divine Being. For the mediator, as long as his death has not yet accomplished the reconciliation, is something one-sided, which takes as essential Being the simple abstract element of thought, not concrete reality. This one-sided extreme of self has not yet equal worth and value with essential Being; the self first gets this as Spirit. The death of this pictorial idea implies at the same time the death of the abstraction of Divine Being, which is not yet affirmed as a self. 'That death is the bitterness of feeling of the "unhappy consciousness", when it feels that God Himself is dead. This harsh utterance is the expression of inmost self-knowledge

which has simply self for its content; it is the return of consciousness into the depth of darkness where Ego is nothing but bare identity with Ego, a darkness distinguishing and knowing nothing more outside it. This feeling thus means, in point of fact, the loss of the Substance and of its objective existence over against consciousness. But at the same time it is the pure subjectivity of Substance, the pure certainty of itself, which it lacked when it was object or immediacy, or pure essential Being. This knowledge is thus spiritualization, whereby Substance becomes Subject, by which its abstraction and lifelessness have expired, and Substance therefore has become real, simple, and universal self-consciousness.

In this way, then, Spirit is Spirit knowing its own self. It knows itself; that, which is for it object, exists, or, in other words, its figurative idea is the true absolute content. As we saw, the content expresses just Spirit itself. It is at the same time not merely content of self-consciousness, and not merely object for self-consciousness; it is also actual Spirit. It is this by the fact of its passing through the three elements of its nature: this movement through its whole self constitutes its actual reality. What moves itself, that is Spirit; it is the subject of the movement, and it is likewise the moving process itself, or the substance through which the subject passes. We saw how the notion of spirit arose when we entered the sphere of religion: it was the process of spirit certain of its self, which forgives evil, and in so doing puts aside its own simplicity and rigid unchangeableness: it was, to state it otherwise, the process, in which what is absolutely in opposition recognizes itself as the same as its opposite, and this knowledge breaks out into the "yea, yea", with which one extreme meets the other. The religious consciousness, to which the Absolute Being is revealed, beholds this notion, and does away with the distinction of its self from what it beholds; and as it is Subject, so it is also Substance; and is thus itself Spirit just because and in so far as it is this process.



This religious communion, however, is not yet fulfilled in this its self-consciousness. Its content, in general, is put before it in the form of a pictorial idea; so that this disruption still attaches even to the actual spiritual character of the communion — to its return out of its figurative thinking; just as the element of pure thought itself was also hampered with that opposition. This spiritual communion is not also consciously aware what it is; it is spiritual self-consciousness, which is not object to itself as this self-consciousness, or does not develop into clear consciousness of itself. Rather, so far as it is consciousness, it has before it those picture-thoughts which were considered.

We see self-consciousness at its last turning point become inward to itself and attain to knowledge of its inner being, of its self-centredness. We see it relinquish its natural existence, and reach pure negativity. But the positive significance — viz. that this negativity, or pure inwardness of knowledge is just as much the self-identical essential Being: put other-wise, that Substance has here attained to being absolute self-consciousness — this is, for the devotional consciousness, an external other. It grasps this aspect-that the knowledge which becomes purely inward is inherently absolute simplicity, or Substance — as the pictorial idea of something which is not thus by its very conception, but as the act of satisfaction obtained from an (alien) other. In other words, it is not really aware as a fact that this depth of pure self is the power by which the abstract essential Being is drawn down from its abstractness and raised to the level of self by the force of this pure devotion. The action of the self hence retains towards it this negative significance, because the relinquishment of itself on the part of substance is for the self something *per se;* the self does not at once grasp and comprehend it, or does not find it in its own action as such.

Since this unity of Essential Being and Self has been inherently brought about, consciousness has this idea also of its reconciliation, but in the form

of an imaginative idea. It obtains satisfaction by attaching, in an external way, to its pure negativity the positive significance of the unity of itself with essential Being. Its satisfaction thus itself remains hampered with the opposition of a beyond. Its own peculiar reconciliation therefore enters its consciousness as something remote, something far away in the future, just as the reconciliation, which the other self achieved, appears as away in the distance of the past. Just as the individual divine man has an implied (essential, *an sich*) father and only an actual mother, in like manner the universal divine man, the spiritual communion, has as its father its own proper action and knowledge, while its mother is eternal Love, which it merely *feels*, but does not behold in its consciousness as an actual immediate object. Its reconciliation, therefore, is in its heart, but still with its conscious life sundered in twain and its actual reality shattered. What falls within its consciousness as the immanent essential element, the aspect of pure mediation, is the reconciliation that lies beyond: while what appears as actually present, as the aspect of immediacy and of existence, is the world which has yet to await transfiguration. The world is no doubt implicitly reconciled with the essential Being; and that Being no doubt knows that it no longer regards, the object as alienated from itself, but as one with itself in its Love. But for self-consciousness this immediate presence has not yet the form and shape of spiritual reality. Thus the spirit of the communion is, in its immediate consciousness, separated from its religious consciousness, which declares indeed that these two modes of consciousness inherently are *not* separated; but this is an implicitness which is not realized, or has not yet become an equally absolute explicit self-existence.

VIII. ABSOLUTE KNOWLEDGE

THE SPIRIT MANIFESTED in revealed religion has not as yet surmounted its attitude of consciousness as such; or, what is the same thing, its actual self-consciousness is not at this stage the object it is aware of. Spirit as a whole and the moments distinguished in it fall within the sphere of figurative thinking, and within the form of objectivity. The *content* of this figurative thought is Absolute Spirit. All that remains to be done now is to cancel and transcend this bare form; or better, because the form appertains to consciousness as such, its true meaning must have already come out in the shapes or modes consciousness has assumed.

The surmounting of the object of consciousness in this way is not to be taken one-sidedly as meaning that the object showed itself returning into the self. It has a more definite meaning: it means that the object as such presented itself to the self as a vanishing factor; and, furthermore, that the emptying of self-consciousness itself establishes thinghood, and that this externalization of self-consciousness has not merely negative, but positive significance, a significance not merely *for us* or *per se,* but for self-consciousness itself. The negative of the object, its cancelling its own existence, gets, for self-consciousness, a positive significance; or, self-consciousness knows this nothingness of the object because on the one hand self-consciousness itself externalizes itself; for in doing so it establishes itself as object, or, by reason of the indivisible unity characterizing its self-existence, sets up the object as its self. On the other hand, there is also this other moment in the process, that self-consciousness has just as really cancelled and superseded this self-relinquishment and objectification, and has resumed them into itself, and is thus at home with itself in its otherness

as such. This is the movement of consciousness, and in this process consciousness is the totality of its moments.

Consciousness, at the same time, must have taken up a relation to the object in all its aspects and phases, and have grasped its meaning from the point of view of each of them. This totality of its determinate characteristics makes the object *per se* or inherently a spiritual reality; and it becomes so in truth for consciousness, when the latter apprehends every individual one of them as self, i.e. when it takes up towards them the spiritual relationship just spoken of.

The object is, then, partly immediate existence, a *thing* in general — corresponding to immediate consciousness; partly an alteration of itself, its relatedness, (or existence-for-another and existence-for-self), *determinatenesss* — corresponding to perception; partly essential being or in the form of a *universal*-corresponding to understanding. The object as a whole is the mediated result [the syllogism] or the passing of universality into individuality through specification, as also the reverse process from individual to universal through cancelled individuality or specific determination.

These three specific aspects, then, determine the ways in which consciousness must know the object as itself. This knowledge of which we are spearing is, however, not knowledge in the sense of pure conceptual comprehension of the object; here this knowledge is to be taken only in its development, has to be taken in its various moments and set forth in the manner appropriate to consciousness as such; and the moments of the notion proper, of pure knowledge, assume the form of shapes or modes of consciousness. For that reason the object does not yet, when present in consciousness as such, appear as the inner essence of Spirit in the way this has just been expressed. The attitude consciousness adopts in regard to the object is not that of considering it either in this totality as such or in the pure

conceptual form; it is partly that of a mode or shape of consciousness in general, partly a multitude of such modes which *we* [who analyze the process] gather together, and in which the totality of the moments of the object and of the process of consciousness can be shown merely resolved into their moments.

To understand this method of grasping the object, where apprehension is a shape or mode of consciousness, we have here only to recall the previous shapes of consciousness which came before us earlier in the argument.

As regards the object, then, so far as it is immediate, an indifferent objective entity, we saw Reason, at the stage of "Observation", seeking and finding itself in this indifferent thing — i.e. we saw it conscious that its activity is there of an external sort, and at the same time conscious of the object merely as an immediate object. We saw, too, its specific character take expression at its highest stage in the infinite judgment: "the being of the ego is a thing". And, further, the ego is an immediate thing of sense. When ego is called a soul, it is indeed represented also as a thing, but a thing in the sense of something invisible, impalpable, etc., i.e. in fact not as an immediate entity and not as that which is generally understood by a thing. That judgment, then, "ego is a thing", taken at first glance, has no spiritual content, or rather, is just the absence of spirituality. In its conception, however, it is in fact the most luminous and illuminating judgment; and this, its inner significance, which is not yet made evident, is what the two other moments to be considered express.

The thing is ego. In point of fact, thing is transcended in this infinite judgment. The thing is nothing in itself; it only has significance in relation, only through the ego and its reference to the ego. This moment came before consciousness in pure insight and enlightenment. Things are simply and solely useful, and only to be considered from the point of view of their utility. The trained and cultivated self-consciousness, which has traversed

the region of spirit in self-alienation, has, by giving up itself, produced the thing as its self; it retains itself, therefore, still in the thing, and knows the thing to have no independence, in other words knows that the thing has essentially and solely a relative existence. Or again — to give complete expression to the relationship, i.e. to what here alone constitutes the nature of the object — the thing stands for something that is self-existent; sense-certainty (sense-experience) is announced as absolute truth; but this self-existence is itself declared to be a moment which merely disappears, and passes into its opposite, into a being at the mercy of an "other".

But knowledge of the thing is not vet finished at this point. The thing must become known as self not merely in regard to the immediateness of its being and as regards its determinateness, but also in the sense of essence or inner reality. This is found in the case of Moral Self-consciousness. This mode of experience knows its knowledge as the absolute essential element, knows no other objective being than pure will or pure knowledge. It is nothing but merely this will and this knowledge. Any other possesses merely non-essential being, i.e. being that has no inherent nature *per se,* but only its empty husk. In so far as the moral consciousness, in its view of the world, lets existence drop out of the self, it just as truly takes this existence back again into its self. In the form of conscience, finally, it is no longer this incessant alternation between the placing" and the "displacing" [dissembling] of existence and self; it knows that its existence as such is this pure certainty of its own self; the objective element, into which *qua* acting it puts forth itself, is nothing else than pure knowledge of itself by itself.

These are the moments which compose the reconciliation of spirit with its own consciousness proper. By themselves they are single and isolated; and it is their spiritual unity alone which furnishes the power for this reconciliation. The last of these moments is, however, necessarily this unity

itself, and, as we see, binds them all in fact into itself. Spirit certain of itself in its objective existence takes as the element of its existence nothing else than this knowledge of self. The declaration that what it does it does in accordance with the conviction of duty-this statement is the warrant for its own action, and makes good its conduct.

Action is the first inherent division of the simple unity of the notion, and the return out of this division. This first movement turns round into the second, since the element of recognition puts itself forward as simple knowledge of duty in contrast to the distinction and diremption that lie in action as such and, in this way, form a rigid reality confronting action. In pardon, however, we saw how this rigid fixity gives way and renounces its claims. Reality has here, *qua immediate existence*, no other significance for self-consciousness than that of being pure knowledge; similarly, *qua determinate existence*, or *qua* relation, what is self-opposed is a knowledge partly of this purely individual self, partly of knowledge *qua* universal. Herein it is established, at the same time, that the third moment, universality, or the essence, means for each of the two opposite factors merely knowledge. Finally they also cancel the empty opposition that still remains, and are the knowledge of ego as identical with ego:-this individual self which is immediately pure knowledge or universal.

This reconciliation of consciousness with self-consciousness thus proves to be brought about in a double-sided way; in the one case, in the religious mind, in the other case, in consciousness itself as such. They axe distinguished *inter se* by the fact that the one is this reconciliation in the form of implicit immanence, the other in the form of explicit self-existence. As we have considered them, they at the beginning fall apart. In the order in which the modes or shapes of consciousness came before us, consciousness has reached the individual moments of that order, and also their unification, long before ever religion gave its object the shape of actual self-

consciousness. The unification of both aspects is not yet brought to light; it is this that winds up this series of embodiments of spirit, for in it spirit gets to the point where it knows itself not only as it is inherently in itself, or in terms of its absolute content, nor only as it is (objectively) for itself in terms of its bare form devoid of content, or in terms of self-consciousness, but as it is in its self-completeness, as it is in itself and for itself.

This unification has, however, already taken place by implication, and has done so in religion in the return of the figurative idea (*Vorstellung*) into self-consciousness, but not according to the proper form, for the religious aspect is the aspect of the essentially independent (*Ansich*) and stands in contrast to the process of self-consciousness. The unification therefore belongs to this other aspect, which by contrast is the aspect of reflexion into self, is that side therefore which contains its self and its opposite, and contains them not only implicitly, (*an sich*) or in a general way, but explicitly (*für sich*) or expressly developed and distinguished. The content, as well as the other aspect of self-conscious spirit, so far as it is the *other* aspect, have been brought to light and are here in their completeness: the unification still a-wanting is the simple unity of the notion. This notion is also already given with the aspect of self-consciousness; but as it previously came before us above, it, like all the other moments, has the form of being a particular mode or shape of consciousness. It is that part of the embodiment of self-assured spirit which keeps within its essential principle and was called the "beautiful soul". That is to say, the "beautiful soul" is its own knowledge of itself in its pure transparent unity — self-consciousness, which knows this pure knowledge of pure inwardness to be spirit, is not merely intuition of the divine, but the self intuition of God Himself.

Since this notion keeps itself fixedly opposed to its realization, it is the one-sided shape which we saw before disappear into thin air, but also positively relinquish itself and advance further. Through this act of

realization, this objectless self-consciousness ceases to hold fast by itself, the determinateness of the notion in contrast with its fulfilment is canceled and done away with. Its self-consciousness attains the form of universality; and what remains is its true notion, the notion that has attained its realization — the notion in its truth, i.e. in unity with its externalization. It is knowledge of pure knowledge, not in the sense of an abstract essence such as duty is, but in the sense of an essential being which *is this* knowledge, this individual pure self-consciousness which is therefore at the same time a genuine *object;* for this notion is the self-existing self.

This notion gave itself its fulfilment partly in the acts performed by the spirit that is sure of itself. partly in religion. In the latter it won the absolute content *qua* content or in the form of a figurative idea or of otherness for consciousness. On the other hand, in the first the form is just the self, for that mode contains the active spirit sure of itself; the self accomplishes the life of Absolute Spirit. This shape (mode), as we see, is that simple notion, which however gives up its eternal essential Being, takes upon itself objective existence, or acts. The power of diremption or of coming forth out of its inwardness lies in the purity of the notion, for this purity is absolute abstraction of negativity. In the same way the notion finds its element of reality, or the objective being it contains, in pure knowledge itself; for this knowledge is simple immediacy, which is being and existence as well as essence, the former negative thought, the latter positive thought. This existence, finally, is just as much that state of reflexion into self which comes out of pure knowledge — both *qua* existence and *qua* duty — and this is the state of evil. This process of "going into self" constitutes the opposition lying in the notion, and is thus the appearance on the scene of pure knowledge of the essence, a knowledge which does not act and is not real. But to make its appearance in this opposition is to participate in it; pure knowledge of essence has inherently relinquished its simplicity, for it

is the diremption of negativity which constitutes the notion. So far as this process of diremption is the process of becoming self-centred, it is the principle of evil: so far as it is the inherently essential, it is the principle which remains good.

Now what in the first instance takes place implicitly is at once for consciousness, and is duplicated as well — is both for consciousness and is its self-existence or its own proper action. The same thing that is already inherently established, thus repeats itself now as knowledge thereof on the part of consciousness and as conscious action. Each lays aside for the other the independence of character with which each appears confronting the other. This waiving of independence is the same renunciation of the one-sidedness of the notion as constituted implicitly the beginning; but it is now its own act of renunciation, just as the notion renounced is its own notion. That implicit nature of the beginning is in truth as much mediated, because it is negativity; it now establishes itself as it is in its truth; and the negative element exists as a determinate quality which each has for the other, and is essentially self-cancelling, self-transcending. The one of the two parts of the opposition is the disparity between existence within itself, in its individuality, and universality; the other, disparity between its abstract universality and the self. The former dies to its self-existence, and relinquishes itself, makes confession; the latter renounces the rigidity of its abstract universality, and thereby dies to its lifeless self and its inert universality; so that the former is completed through the moment of universality, which is the essence, and the latter through universality, which is self. By this process of action spirit has come to light in the form of pure universality of knowledge, which is self-consciousness as self-consciousness, which is simple unity of knowledge. It is through action that spirit is spirit so as definitely to exist; it raises its existence into the sphere

of thought and hence into absolute opposition, and returns out of it through and within this very opposition.

Thus, then, what was in religion content, or a way of imagining (*Vorstellen*) an other, is here the action proper of the self. The notion is the connecting principle securing that the content is the action proper of the self. For this notion is, as we see, the knowledge that the action of the self within itself is all that is essential and all existence, the knowledge of this Subject as Substance and of the Substance as this knowledge of its action. What we have done here, in addition, is simply to gather together the particular moments, each of which in principle exhibits the life of spirit in its entirety, and again to secure the notion in the form of the notion, whose content was disclosed in these moments, and which had already presented itself in the form of a mode or shape of consciousness.

This last embodiment of spirit — spirit which at once gives its complete and true content the form of self, and thereby realizes its notion, and in doing so remains within its own notion — this is A*bsolute Knowledge.* It is spirit knowing itself in the shape of spirit, it is knowledge which comprehends through notions. Truth is here not merely *in itself* absolutely identical with certainty; it has also the shape, the character of certainty of self; or in its existence — i.e. for spirit knowing it — it is in the *form* of knowledge of itself. Truth is the content, which in religion is not as yet at one with its certainty. This identification, however, is secured when the content has received the shape of self. By this means, what constitutes the very essence, viz. the notion, comes to have the nature of existence, i.e. assumes the form of what is objective to consciousness. Spirit, appearing before consciousness in this element of existence, or, what is here the same thing, produced by it in this element, is systematic Science.

The nature, moments, and process of this knowledge have then shown themselves to be such that this knowledge is pure self-existence of self-

consciousness.

It is ego, which is this ego and no other, and at the same time, immediately is mediated, or sublated, universal ego. It has a content, which it distinguishes from itself; for it is pure negativity, or self-diremption; it is consciousness. This content in its distinction is itself the ego, for it is the process of superseding itself, or the same pure negativity which constitutes ego. Ego is in it, *qua* distinguished, reflected into itself; only then is the content comprehended (*begriffen*) when ego in its otherness is still at home with itself. More precisely stated, this content is nothing else than the very process just spoken of; for the content is the spirit which traverses the whole range of its own being, and does this for itself *qua* spirit, by the fact that it possesses the shape of the notion in its objectivity.

As to the actual existence of this notion, science does not appear in time and in reality till spirit has arrived at this stage of being conscious regarding itself. *Qua* spirit which knows what it is, it does not, exist before, and is not to be found at all till after the completion of the task of mastering and constraining its imperfect embodiment — the task of procuring for its consciousness the shape of its inmost essence, and in this manner bringing its self-consciousness level with its consciousness. Spirit in and for itself is, when distinguished into its separate moments, self-existent knowledge, comprehension (*Begreifen*) *in general*, which *as such* has not yet reached the substance, or is not in itself absolute knowledge.

Now in actual reality the knowing substance exists, is there earlier than its form, earlier than the shape of the notion. For the substance is the undeveloped inherent nature, the ground and notion in its inert simplicity, the state of inwardness or the self of spirit which is not yet there. What is there, what does exist, is in the shape of still unexpressed simplicity, the undeveloped immediate, or the object of imagining (*Vorstellen*) consciousness in general. Because knowledge (*Erkennen*) is a spiritual state

of consciousness, which admits as real what essentially is only so far as this is a being for the self and a being of the self or a notion — knowledge has on this account merely a barren object to begin with, in contrast to which the substance and the consciousness of this substance are richer in content. The revelation which substance has in such a consciousness is, in fact, concealment; for the substance is here still self-less existence and nothing but certainty of self is revealed. To begin with, therefore, it is only the abstract moments that belong to self-consciousness concerning the substance. But since these moments are pure activities and must move forward by their very nature, self-consciousness enriches itself till it has torn from consciousness the entire substance, and absorbed into itself the entire structure of the substance with all its constituent elements. Since this negative attitude towards objectivity is positive as well, establishes and fixes the content, it goes on till it has produced these elements out of itself and thereby reinstated them once more as objects of consciousness. In the notion, knowing itself as notion, the moments thus make their appearance prior to the whole in its complete fulfilment; the movement of these moments is the process by which the whole comes into being. In consciousness, on the other hand, the whole — but not as comprehended conceptually — is prior to the moments.

Time is just the notion definitely existent, and presented to consciousness in the form of empty intuition. Hence spirit necessarily appears in time, and it appears in time so long as it does not grasp its pure notion, i.e. so long as it does not annul time. Time is the pure self in external form, apprehended in intuition, and not grasped and understood by the self, it is the notion apprehended only through intuition. When this notion grasps itself, it supersedes its time character, (conceptually) comprehends intuition, and is intuition comprehended and comprehending. Time therefore appears as spirit's destiny and necessity, where spirit is not

yet complete within itself; it is the necessity compelling spirit to enrich the share self-consciousness has in consciousness, to put into motion the immediacy of the inherent nature (which is the form in which the substance is present in consciousness); or, conversely, to realize and make manifest what is inherent, regarded as inward and immanent, to make manifest that which is at first within — i.e. to vindicate it for spirit's certainty of self.

For this reason it must be said that nothing is known which does not fall within experience, or (as it is also expressed) which is not *felt* to be true, which is not given as an inwardly revealed eternal verity, as a sacred object of belief, or whatever other expressions we care to employ. For experience just consists in this, that the content-and the content is spirit — in its inherent nature is substance and so object of consciousness. But this substance, which is spirit, is the development of itself explicitly to what it is inherently and implicitly; and only as this process of reflecting itself into itself is it essentially and in truth spirit. It is inherently the movement which is the process of knowledge — the transforming of that inherent nature into explicitness, of Substance into Subject, of the object of consciousness into the object of self-consciousness, i.e. into an object that is at the same time transcended — in other words, into the notion. This transforming process is a cycle that returns into itself, a cycle that presupposes its beginning, and reaches its beginning only at the end. So far as spirit, then, is of necessity this self-distinction, it appears as a single whole, intuitively apprehended, over against its simple self-consciousness. And since that whole is what is distinguished, it is distinguished into the intuitively apprehended pure notion, Time, and the Content, the inherent, implicit, nature. Substance, *qua* subject, involves the necessity, at first an *inner* necessity, to set forth in itself what it inherently is, to show itself to be spirit. The completed expression in objective form is — and is only when completed — at the same time the reflexion of substance, the development of it into the self.

Consequently, until and unless spirit inherently completes itself, completes itself as a world-spirit, it cannot reach its completion as self-conscious spirit. The content of religion, therefore, expresses earlier in time than (philosophical) science what spirit is; but this science alone is the perfect form in which spirit truly knows itself.

The process of carrying forward this form of knowledge of itself is the task which spirit accomplishes as actual History. The religious communion, in so far as it is at the outset the substance of Absolute Spirit, is the crude form of consciousness, which has an existence all the harsher and more barbaric the deeper is its inner spirit; and its inarticulate self has all the harder task in dealing with its essence, the content of its consciousness alien to itself. Not till it has surrendered the hope of cancelling that foreignness by an external, i.e. alien, method does it turn to itself, to its own peculiar world, in the actual present. It turns thither because to supersede that alien method means returning into self-consciousness. It thus discovers this world in the living present to be its own property; and so has taken the first step to descend from the ideal intelligible world, or rather to quicken the abstract element of the intelligible world with concrete self-hood. Through "observation", on the one hand, it finds existence in the shape of thought, and comprehends existence; and, conversely, it finds in its thought existence. When, in the first instance, it has thus itself expressed in an abstract way the immediate unity of thought and existence, of abstract Essential Reality and Self; and when it has expressed the primal principle of "Light" in a purer form, viz. as unity of extension and existence-for "existence" is an ultimate simple term more adequate to thought than "light"-and in this way has revived again in thought the Substance of the Orient; thereupon spirit at once recoils in horror from this abstract unity, from this self-less substantiality, and maintains as against it the principle of Individuality. But after Spirit has externalized this principle in the process

of its culture, has thereby made it an objective existence and established it throughout the whole of existence, has arrived at the idea of "Utility" and in the sphere of absolute freedom has grasped existence as its Individual Will,- after these stages, spirit then brings to light the thought that lies in its inmost depths, and expresses essential Reality in the form Ego=Ego.

This "Ego identical with Ego" is, however, the self-reflecting process; for since this identity *qua* absolute negativity is absolute distinction, the self-identity of the Ego stands in contrast to this absolute distinction, which — being pure distinction and at the same time objective to the self that knows itself — has to be expressed as Time. In this way, just as formerly Essential Reality was expressed as unity of thought and *extension*, it would here be interpreted as unity of thought and *time*. But distinction left to itself, unresting, unhalting time, really collapses upon itself; it is the objective quiescence of extension; while this latter is pure identity with self — is Ego.

Again, Ego is not merely self, it is identity of self with itself. This identity, however, is complete and immediate unity with self; in other words this Subject is just as much Substance. Substance by itself alone would be void and empty Intuition (*Anschauen*), or the intuition of a content which *qua* specific would have merely a contingent character and would be devoid of necessity. Substance would only stand for the Absolute in so far as Substance was thought of or "intuited" as absolute unity; and all content would, as regards its diversity, have to fall outside the Substance and be due to reflexion, a process which does not belong to Substance, because Substance would not be Subject, would not be conceived as Spirit, as reflecting about self and reflecting itself into self. if, nevertheless, a content were to be spoken of, then on the one hand it would only exist in order to be thrown into the empty abyss of the Absolute, while on the other it would be picked up in external fashion from sense perception. Knowledge would appear to have come by things, by what is distinct from knowledge itself,

and to have got at the distinctions between the endless variety of things, without any one understanding how or where all this came from.

Spirit, however, has shown itself to us to be neither the mere withdrawal of self-consciousness into its pure inwardness, nor the mere absorption of self-consciousness into Substance and the nothingness of its (self-) distinction. Spirit is the movement of the self which empties (externalizes) itself of self and sinks itself within its own substance, and *qua* subject, both has gone out of that substance into itself, making its substance an object and a content, and also supersedes this distinction of objectivity and content. That first reflexion out of immediacy is the subject's process of distinction of itself from its substance, the notion in a process of self-diremption, the going-into-itself and the coming into being of the pure ego. Since this distinction is the pure action of Ego=Ego, the notion is the necessity for and the rising of existence, which has the substance for its essential nature and subsists on its own account. But this subsisting of existence for itself is the notion established in determinate form, and is thereby the notion's own inherent movement — that of descending into the simple substance, which is only subject by being this negativity and going through this process.

Ego has not to take its stand on the form of self-consciousness in opposition to the form of substantiality and objectivity, as if it were afraid of relinquishing or externalizing itself. The power of spirit lies rather in remaining one with itself when giving up itself, and, because it is self-contained and self-subsistent, in establishing as mere moments its explicit self-existence as well as its implicit inherent nature. Nor again is Ego a *tertium quid* which casts distinctions back into the abyss of the Absolute, and declares them all to mean the same there. On the contrary, true knowledge lies rather in the seeming inactivity which merely watches how what is distinguished is self-moved by its very nature and returns again into its own unity.

With absolute knowledge, then, Spirit has wound up the process of its embodiment, so far as the assumption of those various shapes or modes is affected with the insurmountable distinction which consciousness implies [i.e. the distinction of consciousness from its object or content]. Spirit has attained the pure element of its existence, the notion. The content is, in view of the freedom of its own existence, the self that empties (externalizes) itself; in other words, that content is the *immediate* unity of self-knowledge. The pure process of thus externalizing itself constitutes — when we consider this process in its content — the *necessity* of this content. The diversity of content is, *qua* determinate, due to relation, and is not inherent; and its restless activity consists in cancelling and superseding itself, or is negativity. Thus the necessity or diversity, like its free existence, is the self too; and in this self-form, in which existence is immediately thought, the content is a notion. Seeing, then, that Spirit has attained the notion, it unfolds its existence and develops its processes in this ether of its life and is *(Philosophical) Science*. The moments of its process are set forth therein no longer as determinate modes or shapes of consciousness, but — since the distinction, which consciousness implies, has reverted to and has become a distinction within the self — as determinate notions, and as the organic self-explaining and self-constituted process of these notions. While in the *Phenomenology of Mind* each moment is the distinction of knowledge and truth, and is the process in which that distinction is canceled and transcended, Absolute Knowledge does not contain this distinction and supersession of distinction. Rather, since each moment has the form of the notion, it unites the objective form of truth and the knowing self in an immediate unity. Each individual moment does not appear as the process of passing back and forward from consciousness or figurative (imaginative) thought to self-consciousness and conversely: on the contrary, the pure shape, liberated from the condition of being an appearance in mere

consciousness — the pure notion with its further development — depends solely on its pure characteristic nature. Conversely, again, there corresponds to every abstract moment of Absolute Knowledge a mode in which mind as a whole makes its appearance. As the mind that actually exists is not richer than it, so, too, mind in its actual content is not poorer. To know the pure notions of knowledge in the form in which they are modes or shapes of consciousness — this constitutes the aspect of their reality, according to which their essential element, the notion, appearing there in its simple mediating activity as thinking, breaks up and separates the moments of this mediation and exhibits them to itself in accordance with their immanent opposition.

Absolute Knowledge contains within itself this necessity of relinquishing itself from notion, and necessarily involves the transition of the notion into consciousness. For Spirit that knows itself is, just for the reason that it grasps its own notion, immediate identity with itself; and this, in the distinction that it implies, is the certainty of what is immediate or is sense-consciousness — the beginning from which we started. This process of releasing itself from the form of its self is the highest freedom and security of its knowledge of itself.

All the same, this relinquishment (externalization) of self is still incomplete. This process expresses the relation of the certainty of its self to the object, an object which, just by being in a relation, has not yet attained its full freedom. Knowledge is aware not only of itself, but also of the negative of itself, or its limit. Knowing its limit means knowing how to sacrifice itself. This sacrifice is the self-abandonment, in which Spirit sets forth, in the form of free fortuitous happening, its process of becoming Spirit, intuitively apprehending outside it its pure self as Time, and likewise its existence as Space. This last form into which Spirit passes, *Nature,* is its living immediate process of development. Nature-Spirit divested of self

(externalized) — is, in its actual existence, nothing but this eternal process of abandoning its (Nature's) own independent subsistence, and the movement which reinstates Subject.

The other aspect, however, in which Spirit comes into being, *History,* is the process of becoming in terms of knowledge, a conscious self-mediating process — Spirit externalized and emptied into Time. But this form of abandonment is, similarly, the emptying of itself by itself; the negative is negative of itself. This way of becoming presents a slow procession and succession of spiritual shapes (*Geistern*), a gallery of pictures, each of which is endowed with the entire wealth of Spirit, and moves so slowly just for the reason that the self has to permeate and assimilate all this wealth of its substance. Since its accomplishment consists in Spirit knowing what it is, in fully comprehending its substance, this knowledge means its concentrating itself on itself (*Insichgehen*),a state in which Spirit leaves its external existence behind and gives its embodiment over to Recollection (*Erinnerung*). In thus concentrating itself on itself, Spirit is engulfed in the night of its own self-consciousness; its vanished existence is, however, conserved therein; and this superseded existence — the previous state, but born anew from the womb of knowledge — is the new stage of existence, a new world, and a new embodiment or mode of Spirit. Here it has to begin all over again at its immediacy, as freshly as before, and thence rise once more to the measure of its stature, as if, for it, all that preceded were lost, and as if it had learned nothing from the experience of the spirits that preceded. But re-collection (*Erinnerung*) has conserved that experience. and is the inner being, and, in fact, the higher form of the substance. While, then, this phase of Spirit begins all over again its formative development, apparently starting solely from itself, yet at the same time it commences at a higher level. The realm of spirits developed in this way, and assuming definite shape in existence, constitutes a succession, where one detaches

and sets loose the other, and each takes over from its predecessor the empire of the spiritual world. The goal of the process is the revelation of the depth of spiritual life, and this is the Absolute Notion. This revelation consequently means superseding its "depth", is its "extension" or *spatial* embodiment, the negation of this inwardly self-centred *(insichseiend*) ego — a negativity which is its self-relinquishment, its externalization, or its substance: and this revelation is also its *temporal* embodiment, in that this externalization in its very nature relinquishes (externalizes) itself, and so exists at once in its spatial extension" as well as in its "depth" or the self. The goal, which is Absolute Knowledge or Spirit knowing itself as Spirit, finds its pathway in the recollection of spiritual forms (*Geister*) as they are in themselves and as they accomplish the organization of their spiritual kingdom. Their conservation, looked at from the side of their free existence appearing in the form of contingency, is *History;* looked at from the side of their intellectually comprehended organization, it is the Science of the ways in which knowledge appears. Both together, or History (intellectually) comprehended (*begriffen*), form at once the recollection and the Golgotha of Absolute Spirit, the reality, the truth, the certainty of its throne, without which it were lifeless, solitary, and alone. Only

The chalice of this realm of spirits
Foams forth to God His own Infinitude

The Logic of Hegel

Translated by William Wallace

PART I OF 'ENCYCLOPEDIA OF THE PHILOSOPHICAL SCIENCES'

The Logic of Hegel (also known as *The Lesser Logic*) forms the first part of Hegel's *Encyclopaedia of the Philosophical Sciences* (1817), which presents an abbreviated version of Hegel's systematic philosophy in its entirety; in fact, it is the only form in which Hegel ever published his entire mature philosophical system. Intended as a pedagogical aid for attendees of his lectures, Hegel revised and extended the *Encyclopaedia of the Philosophical Sciences* over more than a decade, stressing its role as a "textbook" in need of elucidation through oral commentary.

The treatise describes the pattern of the Idea as manifesting itself in dialectical reasoning. Though some believe that the philosophy of nature and mind are applications of the logic, Hegel argues that this is a misunderstanding. The purpose of the *Encyclopaedia of the Philosophical Sciences* is descriptive: to describe how *Geist* (Spirit or Mind) develops itself and not to apply the dialectical method to all areas of human knowledge. Hegel argues that Spirit is in process of growing, like a seed growing into a mature tree, thus it passes through stages. The first stage of Spirit's development is described in the Logic.

Consequently, the *Logic* presents the categories of thought as they are in themselves; they are the minimal conditions for thinking anything at all, the conceptions that run in the background of all our thinking. These logical categories turn out to be none other than *Geist* itself. In order to get at what

a thing is, we must think about it. No amount of observing will bring us to the essence of things. Thinking and being are equivalent, and so logic and metaphysics are equivalent as well. The underlying element of it all is *Geist*; therefore, the activity of thinking is no less than *Geist* articulating itself. As *Geist* works itself out more fully, it reaches the point where it simply cannot remain as it is; it is incomplete, and therefore it "others" itself; this is where the philosophy of nature emerges. When this stage of its development is completed, *Geist* "returns" to itself, which is the emergence of the philosophy of mind.

I. Introduction

§ 1

Philosophy misses an advantage enjoyed by the other sciences. It cannot like them rest the existence of its objects on the natural admissions of consciousness, nor can it assume that its method of cognition, either for starting or for continuing, is one already accepted. The objects of philosophy, it is true, are upon the whole the same as those of religion. In both the object is Truth, in that supreme sense in which God and God only is the Truth. Both in like manner go on to treat of the finite worlds of Nature and the human Mind, with their relation to each other and to their truth in God. Some *acquaintance* with its objects, therefore, philosophy may and even must presume, that and a certain interest in them to boot, were it for no other reason than this: that in point of time the mind makes general *images* of objects, long before it makes *notions* of them, and that it is only through these mental images, and by recourse to them, that the thinking mind rises to know and comprehend *thinkingly*.

But with the rise of this thinking study of things, it soon becomes evident that thought will be satisfied with nothing short of showing the *necessity* of its facts, of demonstrating the existence of its objects, as well as their nature and qualities. Our original acquaintance with them is thus discovered to be inadequate. We can assume nothing and assert nothing dogmatically; nor can we accept the assertions and assumptions of others. And yet we must make a beginning: and a beginning, as primary and underived, makes an assumption, or rather is an assumption. It seems as if it were impossible to make a beginning at all.

§ 2

This *thinking study of things* may serve, in a general way, as a description of philosophy. But the description is too wide. If it be correct to say, that thought makes the distinction between man and the lower animals, then everything human is human, for the sole and simple reason that it is due to the operation of thought. Philosophy, on the other hand, is a peculiar mode of thinking — a mode in which thinking becomes knowledge, and knowledge through notions. However great therefore may be the identity and essential unity of the two modes of thought, the philosophic mode gets to be different from the more general thought which acts in all that is human, in all that gives humanity its distinctive character. And this difference connects itself with the fact that the strictly human and thought-induced phenomena of consciousness do not originally appear in the form of a thought, but as a feeling, a perception, or mental image — all of which aspects must be distinguished from the form of thought proper.

According to an old preconceived idea, which has passed into a trivial proposition, it is thought which marks the man off from the animals. Yet trivial as this old belief may seem, it must, strangely enough, be recalled to mind in presence of certain preconceived ideas of the present day. These ideas would put feeling and thought so far apart as to make them opposites, and would represent them as so antagonistic, that feeling, particularly religious feeling, is supposed to be contaminated, perverted, and even annihilated by thought. They also emphatically hold that religion and piety grow out of, and rest upon something else, and not on thought. But those who make this separation forget meanwhile that only man has the capacity for religion, and that animals no more have religion than they have law and morality.

Those who insist on this separation of religion from thinking usually have before their minds the sort of thought that may be styled *after-thought*.

They mean ‘reflective’ thinking, which has to deal with thoughts as thoughts, and brings them into consciousness. Slackness to perceive and keep in view this distinction which philosophy definitely draws in respect of thinking is the source of the crudest objections and reproaches against philosophy. Man — and that just because it is his nature to think — is the only being that possesses law, religion, and morality. In these spheres of human life, therefore, thinking, under the guise of feeling, faith, or generalised image, has not been inactive: its action and its productions are there present and therein contained. But it is one thing to have such feelings and generalised images that have been moulded and permeated by thought, and another thing to have thoughts about them. The thoughts, to which after-thought upon those modes of consciousness gives rise, are what is comprised under reflection, general reasoning, and the like, as well as under philosophy itself.

The neglect of this distinction between thought in general and the reflective thought of philosophy has also led to another and more frequent misunderstanding. Reflection of this kind has been often maintained to be the condition, or even the only way, of attaining a consciousness and certitude of the Eternal and True. The (now somewhat antiquated) metaphysical proofs of God’s existence, for example, have been treated, as if a knowledge of them and a conviction of their truth were the only and essential means of producing a belief and conviction that there is a God. Such a doctrine would find its parallel, if we said that eating was impossible before we had acquired a knowledge of the chemical, botanical, and zoological characters of our food; and that we must delay digestion till we had finished the study of anatomy and physiology. Were it so, these sciences in their field, like philosophy in its, would gain greatly in point of utility; in fact, their utility would rise to the height of absolute and universal

indispensableness. Or rather, instead of being indispensable, they would not exist at all.

§ 3

The Content

The several modes of feeling, perception, desire, and will, so far as we are aware of them, are in general called ideas (mental representations): and it may be roughly said that philosophy puts thoughts, categories, or, in more precise language, adequate notions, in the place of the generalised images we ordinarily call ideas. Mental impressions such as these may be regarded as the metaphors of thoughts and notions. But to have these figurate conceptions does not imply that we appreciate their intellectual significance, the thoughts and rational notions to which they correspond. Conversely, it is one thing to have thoughts and intelligent notions, and another to know what impressions, perceptions, and feelings correspond to them.

This difference will to some extent explain what people call the unintelligibility of philosophy. Their difficulty lies partly in an incapacity — which in itself is nothing but want of habit — for abstract thinking; i.e. in an inability to get hold of pure thoughts and move about in them. In our ordinary state of mind, the thoughts are clothed upon and made one with the sensuous or spiritual material of the hour; and in reflection, meditation, and general reasoning, we introduce a blend of thoughts into feelings, percepts, and mental images. (Thus, in propositions where the subject-matter is due to the senses — e.g. ‘This leaf is green’ — we have such categories introduced, as being and individuality.) But it is a very different thing to make the thoughts pure and simple our object.

But their complaint that philosophy is unintelligible is as much due to another reason; and that is an impatient wish to have before them as a

mental picture that which is in the mind as a thought or notion. When people are asked to apprehend some notion, they often complain that they do not know what they have to think. But the fact is that in a notion there is nothing further to be thought than the notion itself. What the phrase reveals is a hankering after an image with which we are already familiar. The mind, denied the use of its familiar ideas, feels the ground where it once stood firm and at home taken away from beneath it, and, when transported into the region of pure thought, cannot tell where in the world it is.

One consequence of this weakness is that authors, preachers, and orators are found most intelligible, when they speak of things which their readers or hearers already know by rote — things which the latter are conversant with, and which require no explanation.

§ 4

The philosopher then has to reckon with popular modes of thought, and with the objects of religion. In dealing with the ordinary modes of mind, he will first of all, as we saw, have to prove and almost to awaken the need for his peculiar method of knowledge. In dealing with the objects of religion, and with truth as a whole, he will have to show that philosophy is capable of apprehending them from its own resources; and should a difference from religious conceptions come to light, he will have to justify the points in which it diverges.

§ 5

To give the reader a preliminary explanation of the distinction thus made, and to let him see at the same moment that the real import of our consciousness is retained, and even for the first time put in its proper light, when translated into the form of thought and the notion of reason, it may be well to recall another of these old unreasoned beliefs. And that is the

conviction that to get at the truth of any object or event, even of feelings, perceptions, opinions, and mental ideas, we must think it over. Now in any case to think things over is at least to transform feelings, ordinary ideas, etc. into thoughts.

Nature has given every one a faculty of thought. But thought is all that philosophy claims as the form proper to her business: and thus the inadequate view which ignores the distinction stated in § 3 leads to a new delusion, the reverse of the complaint previously mentioned about the unintelligibility of philosophy. In other words, this science must often submit to the slight of hearing even people who have never taken any trouble with it talking as if they thoroughly understood all about it. With no preparation beyond an ordinary education they do not hesitate, especially under the influence of religious sentiment, to philosophise and to criticise philosophy. Everybody allows that to know any other science you must have first studied it, and that you can only claim to express a judgment upon it in virtue of such knowledge. Everybody allows that to make a shoe you must have learned and practised the craft of the shoemaker, though every man has a model in his own foot, and possesses in his hands the natural endowments for the operations required. For philosophy alone, it seems to be imagined, such study, care, and application are not in the least requisite.

This comfortable view of what is required for a philosopher has recently received corroboration through the theory of immediate or intuitive knowledge.

§ 6

So much for the form of philosophical knowledge. It is no less desirable, on the other hand, that philosophy should understand that its content is no other than actuality

In the Preface to my Philosophy of Right, p. xix, are found the propositions:

What is reasonable is actual and What is actual is reasonable.

These simple statements have given rise to expressions of surprise and hostility, even in quarters where it would be reckoned an insult to presume absence of philosophy, and still more of religion. Religion at least need not be brought in evidence; its doctrines of the divine governments of the world affirm these propositions too decidedly. For their philosophic sense, we must presuppose intelligence enough to know, not only that God is actual, that He is the supreme actuality, that He alone is truly actual; but also, as regards the logical bearings of the question, that existence is in part mere appearance, and only in part actuality. In common life, any freak of fancy, any error, evil and everything of the nature of evil, as well as every degenerate and transitory existence whatever, gets in a casual way the name of actuality. But even our ordinary feelings are enough to forbid a casual (fortuitous) existence getting the emphatic name of an actual; for by fortuitous we mean an existence which has no greater value than that of something possible, which may as well not be as be. As for the term Actuality, these critics would have done well to consider the sense in which I employ it. In a detailed Logic I had treated among other things of actuality, and accurately distinguished it not only from the fortuitous, which, after all, has existence, but even from the cognate categories of existence and the other modifications of being.

The actuality of the rational stands opposed by the popular fancy that Ideas and ideals are nothing but chimeras, and philosophy a mere system of such phantasms. It is also opposed by the very different fancy that Ideas and ideals are something far too excellent to have actuality, or something too impotent to procure it for themselves. This divorce between idea and reality is especially dear to the analytic understanding which looks upon its own

abstractions, dreams though they are, as something true and real, and prides itself on the imperative ‘ought’, which it takes especial pleasure in prescribing even on the field of politics. As if the world had waited on it to learn how it ought to be, and was not! For, if it were as it ought to be, what would come of the precocious wisdom of that ‘ought’? When understanding turns this ‘ought’ against trivial external and transitory objects, against social regulations or conditions, which very likely possess a great relative importance for a certain time and special circles, it may often be right. In such a case the intelligent observer may meet much that fails to satisfy the general requirements of right; for who is not acute enough to see a great deal in his own surroundings which is really far from being as it ought to be? But such acuteness is mistaken in the conceit that, when it examines these objects and pronounces what they ought to be, it is dealing with questions of philosophic science. The object of philosophy is the Idea: and the Idea is not so impotent as merely to have a right or an obligation to exist without actually existing. The object of philosophy is an actuality of which those objects, social regulations and conditions, are only the superficial outside.

§ 7

Thus reflection — thinking things over — in a general way involves the principle (which also means the beginning) of philosophy. And when the reflective spirit arose again in its independence in modern times, after the epoch of the Lutheran Reformation, it did not, as in its beginnings among the Greeks, stand merely aloof, in a world of its own, but at once turned its energies also upon the apparently illimitable material of the phenomenal world. In this way the name philosophy came to be applied to all those branches of knowledge, which are engaged in ascertaining the standard and Universal in the ocean of empirical individualities, as well as in ascertaining

the Necessary element, or Laws, to be found in the apparent disorder of the endless masses of the fortuitous. It thus appears that modern philosophy derives its materials from our own personal observations and perceptions of the external and internal world, from nature as well as from the mind and heart of man, when both stand in the immediate presence of the observer.

This principle of Experience carries with it the unspeakably important condition that, in order to accept and believe any fact, we must be in contact with it; or, in more exact terms, that we must find the fact united and combined with the certainty of our own selves. We must be in touch with our subject-matter, whether it be by means of our external senses, or, else, by our profounder mind and our intimate self-consciousness. This principle is the same as that which has in the present day been termed faith, immediate knowledge, the revelation in the outward world, and, above all, in our own heart.

§ 9

But in the second place in point of form the subjective reason desires a further satisfaction than empirical knowledge gives; and this form is, in the widest sense of the term, Necessity (§ 1). The method of empirical science exhibits two defects. The first is that the Universal or general principle contained in it, the genus, or kind, etc., is, on its own account, indeterminate and vague, and therefore not on its own account connected with the Particulars or the details. Either is external and accidental to the other; and it is the same with the particular facts which are brought into union: each is external and accidental to the others. The second defect is that the beginnings are in every case data and postulates, neither accounted for nor deduced. In both these points the form of necessity fails to get its due. Hence reflection, whenever it sets itself to remedy these defects, becomes speculative thinking, the thinking proper to philosophy. As a species of

reflection, therefore, which, though it has a certain community of nature with the reflection already mentioned, is nevertheless different from it, philosophic thought thus possesses, in addition to the common forms, some forms of its own, of which the Notion may be taken as the type.

From notion in the speculative sense we should distinguish what is ordinarily called a notion. The phrase, that no notion can ever comprehend the Infinite, a phrase which has been repeated over and over again till it has grown axiomatic, is based upon this narrow estimate of what is meant by notions.

§ 10

This thought, which is proposed as the instrument of philosophic knowledge, itself calls for further explanation. We must understand in what way it possesses necessity or cogency: and when it claims to be equal to the task of apprehending the absolute objects (God, Spirit, Freedom), that claim must be substantiated. Such an explanation, however, is itself a lesson in philosophy, and properly falls within the scope of the science itself. A preliminary attempt to make matters plain would only be unphilosophical, and consist of a tissue of assumptions, assertions, and inferential pros and cons, i.e. of dogmatism without cogency, as against which there would be an equal right of counter-dogmatism.

A main line of argument in the Critical Philosophy bids us pause before proceeding to inquire into God or into the true being of things, and tells us first of all to examine the faculty of cognition and see whether it is equal to such an effort. We ought, says Kant, to become acquainted with the instrument, before we undertake the work for which it is to be employed; for if the instrument be insufficient, all our trouble will be spent in vain. The plausibility of this suggestion has won for it general assent and admiration; the result of which has been to withdraw cognition from an

interest in its objects and absorption in the study of them, and to direct it back upon itself; and so turn it to a question of form. Unless we wish to be deceived by words, it is easy to see what this amounts to. In the case of other instruments, we can try and criticise them in other ways than by setting about the special work for which they are destined. But the examination of knowledge can only be carried out by an act of knowledge. To examine this so-called instrument is the same thing as to know it. But to seek to know before we know is as absurd as the wise resolution of Scholasticus, not to venture into the water until he had learned to swim.

Reinhold saw the confusion with which this style of commencement is chargeable, and tried to get out of the difficulty by starting with a hypothetical and problematical stage of philosophising. In this way he supposed that it would be possible, nobody can tell how, to get along, until we found ourselves, further on, arrived at the primary truth of truths. His method, when closely looked into, will be seen to be identical with a very common practice. It starts from a substratum of experiential fact, or from a provisional assumption which has been brought into a definition; and then proceeds to analyse this starting-point. We can detect in Reinhold's argument a perception of the truth, that the usual course which proceeds by assumptions and anticipations is no better than a hypothetical and problematical mode of procedure. But his perceiving this does not alter the character of this method; it only makes clear its imperfections.

§ 11

The special conditions which call for the existence of philosophy may be thus described. The mind or spirit, when it is sentient or perceptive, finds its object in something sensuous; when it imagines, in a picture or image; when it wills, in an aim or end. But in contrast to, or it may be only in distinction from, these forms of its existence and of its objects, the mind has

also to gratify the cravings of its highest and most inward life. That innermost self is thought. Thus the mind renders thought its object. In the best meaning of the phrase, it comes to itself; for thought is its principle, and its very unadulterated self. But while thus occupied, thought entangles itself in contradictions, i.e. loses itself in the hard-and-fast non-identity of its thoughts, and so, instead of reaching itself, is caught and held in its counterpart. This result, to which honest but narrow thinking leads the mere understanding, is resisted by the loftier craving of which we have spoken. That craving expresses the perseverance of thought, which continues true to itself, even in this conscious loss of its native rest and independence, 'that it may overcome' and work out in itself the solution of its own contradictions.

On the relation between 'immediacy' and 'mediation' in consciousness we shall speak later, expressly and with more detail. Here it may be sufficient to premise that, though the two 'moments' or factors present themselves as distinct, still neither of them can be absent, nor can one exist apart from the other. Thus the knowledge of God, as of every supersensible reality, is in its true character an exaltation above sensations or perceptions: it consequently involves a negative attitude to the initial data of sense, and to that extent implies mediation. For to mediate is to take something as a beginning and to go onward to a second thing; so that the existence of this second thing depends on our having reached it from something else contradistinguished from it. In spite of this, the knowledge of God is no mere sequel, dependent on the empirical phase of consciousness: in fact, its independence is essentially secured through this negation and exaltation. No doubt, if we attach an unfair prominence to the fact of mediation, and represent it as implying a state of conditionedness, it may be said — not that the remark would mean much — that philosophy is the child of experience, and owes its rise to a posteriori fact. (As a matter of fact, thinking is always the negation of what we have immediately before us.)

With as much truth however we may be said to owe eating to the means of nourishment, so long as we can have no eating without them. If we take this view, eating is certainly represented as ungrateful: it devours that to which it owes itself. Thinking, upon this view of its action, is equally ungrateful.

§ 13

Stated in exact terms, such is the origin and development of philosophy. But the History of Philosophy gives us the same process from a historical and external point of view. The stages in the evolution of the Idea there seem to follow each other by accident, and to present merely a number of different and unconnected principles, which the several systems of philosophy carry out in their own way. But it is not so. For these thousands of years the same Architect has directed the work: and that Architect is the one living Mind whose nature is to think, to bring to self-consciousness what it is, and, with its being thus set as object before it, to be at the same time raised above it, and so to reach a higher stage of its own being. The different systems which the history of philosophy presents are therefore not irreconcilable with unity.

We may either say, that it is one philosophy at different degrees of maturity: or that the particular principle, which is the groundwork of each system, is but a branch of one and the same universe of thought. In philosophy the latest birth of time is the result of all the systems that have preceded it, and must include their principles; and so, if, on other grounds, it deserve the title of philosophy, will be the fullest, most comprehensive, and most adequate system of all.

The spectacle of so many and so various systems of philosophy suggests the necessity of defining more exactly the relation of Universal to Particular. When the universal is made a mere form and co-ordinated with the particular, as if it were on the same level, it sinks into a particular itself.

Even common sense in everyday matters is above the absurdity of setting a universal beside the particulars. Would any one, who wished for fruit, reject cherries, pears, and grapes, on the ground that they were cherries, pears, or grapes, and not fruit? But when philosophy is in question, the excuse of many is that philosophies are so different, and none of them is the philosophy — that each is only a philosophy. Such a plea is assumed to justify any amount of contempt for philosophy. And yet cherries too are fruit. Often, too, a system, of which the principle is the universal, is put on a level with another of which the principle is a particular, and with theories which deny the existence of philosophy altogether. Such systems are said to be only different views of philosophy. With equal justice, light and darkness might be styled different kinds of light.

§ 14

The same evolution of thought which is exhibited in the history of philosophy is presented in the System of Philosophy itself. Here, instead of surveying the process, as we do in history, from the outside, we see the movement of thought clearly defined in its native medium. The thought, which is genuine and self-supporting, must be intrinsically concrete; it must be an Idea; and when it is viewed in the whole of its universality, it is the Idea, or the Absolute. The science of this Idea must form a system. For the truth is concrete; that is, while it gives a bond and principle of unity, it also possesses an internal source of development. Truth, then, is only possible as a universe or totality of thought; and the freedom of the whole, as well as the necessity of the several sub-divisions, which it implies, are only possible when these are discriminated and defined.

Unless it is a system, a philosophy is not a scientific production. Unsystematic philosophising can only be expected to give expression to personal peculiarities of mind, and has no principle for the regulation of its

contents. Apart from their interdependence and organic union, the truths of philosophy are valueless, and must then be treated as baseless hypotheses, or personal convictions. Yet many philosophical treatises confine themselves to such an exposition of the opinions and sentiments of the author.

The term system is often misunderstood. It does not denote a philosophy, the principle of which is narrow and to be distinguished from others. On the contrary, a genuine philosophy makes it a principle to include every particular principle.

§ 15

Each of the parts of philosophy is a philosophical whole, a circle rounded and complete in itself. In each of these parts, however, the philosophical Idea is found in a particular specificality or medium. The single circle, because it is a real totality, bursts through the limits imposed by its special medium, and gives rise to a wider circle. The whole of philosophy in this way resembles a circle of circles. The Idea appears in each single circle, but, at the same time, the whole Idea is constituted by the system of these peculiar phases, and each is a necessary member of the organisation.

§ 16

In the form of an Encyclopaedia, the science has no room for a detailed exposition of particulars, and must be limited to setting forth the commencement of the special sciences and the notions of cardinal importance in them.

How much of the particular parts is requisite to constitute a particular branch of knowledge is so far indeterminate, that the part, if it is to be something true, must be not an isolated member merely, but itself an organic whole. The entire field of philosophy therefore really forms a single

science; but it may also be viewed as a total, composed of several particular sciences.

The encyclopaedia of philosophy must not be confounded with ordinary encyclopaedias. An ordinary encyclopaedia does not pretend to be more than an aggregation of sciences, regulated by no principle, and merely as experience offers them. Sometimes it even includes what merely bear the name of sciences, while they are nothing more than a collection of bits of information. In an aggregate like this, the several branches of knowledge owe their place in the encyclopaedia to extrinsic reasons, and their unity is therefore artificial: they are arranged, but we cannot say they form a system. For the same reason, especially as the materials to be combined also depend upon no one rule or principle, the arrangement is at best an experiment, and will always exhibit inequalities.

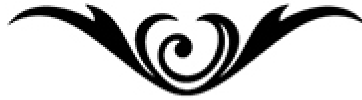
An encyclopaedia of philosophy excludes three kinds of partial science. I. It excludes mere aggregates of bits of information. Philology in its prima facie aspect belongs to this class. II. It rejects the quasi-sciences, which are founded on an act of arbitrary will alone, such as Heraldry. Sciences of this class are positive from beginning to end. III. In another class of sciences, also styled positive, but which have a rational basis and a rational beginning, philosophy claims that constituent as its own. The positive features remain the property of the sciences themselves.

§ 17

It may seem as if philosophy, in order to start on its course, had, like the rest of the sciences, to begin with a subjective presupposition. The sciences postulate their respective objects, such as space, number, or whatever it be; and it might be supposed that philosophy had also to postulate the existence of thought. But the two cases are not exactly parallel. It is by the free act of thought that it occupies a point of view, in which it is for its own self, and

thus gives itself an object of its own production. Nor is this all. The very point of view, which originally is taken on its own evidence only, must in the course of the science be converted to a result — the ultimate result in which philosophy returns into itself and reaches the point with which it began. In this manner philosophy exhibits the appearance of a circle which closes with itself, and has no beginning in the same way as the other sciences have. To speak of a beginning of philosophy has a meaning only in relation to a person who proposes to commence the study, and not in relation to the science as science. The same thing may be thus expressed. The notion of science — the notion therefore with which we start — which, for the very reason that it is initial, implies a separation between the thought which is our object, and the subject philosophising which is, as it were, external to the former, must be grasped and comprehended by the science itself. This is in short, the one single aim, action, and goal of philosophy — to arrive at the notion of its notion, and thus secure its return and its satisfaction.

§ 18



As the whole science, and only the whole, can exhibit what the Idea or system of reason is, it is impossible to give in a preliminary way a general impression of a philosophy. Nor can a division of philosophy into its parts be intelligible, except in connection with the system. A preliminary division, like the limited conception from which it comes, can only be an anticipation. Here however it is premised that the Idea turns out to be the thought which is completely identical with itself, and not identical simply in the abstract, but also in its action of setting itself over against itself, so as to gain a being of its own, and yet of being in full possession of itself while it is in this other. Thus philosophy is subdivided into three parts:

I. Logic: the science of the Idea in and for itself. II. The Philosophy of Nature: the science of the Idea in its otherness. III. The Philosophy of Mind: the science of the Idea come back to itself out of that otherness.

As observed in § 15, the differences between the several philosophical sciences are only aspects or specialisations of the one Idea or system of reason, which and which alone is alike exhibited in these different media. In Nature nothing else would have to be discerned, except the Idea; but the Idea has here divested itself of its proper being. In Mind, again, the Idea has asserted a being of its own, and is on the way to become absolute. Every such form in which the Idea is expressed is at the same time a passing or fleeting stage; and hence each of these subdivisions has not only to know its contents as an object which has being for the time, but also in the same act to expound how these contents pass into their higher circle. To represent the relation between them as a division, therefore, leads to misconception; for it co-ordinates the several parts or sciences one beside another, as if they had no innate development, but were, like so many species, really and radically distinct.

II. Preliminary Notion

Logic derived from a survey of the whole system

§ 19

Logic is the science of the pure Idea; pure, that is, because the Idea is in the abstract medium of Thought.

This definition, and the others which occur in these introductory outlines, are derived from a survey of the whole system, to which accordingly they are subsequent. The same remark applies to all prefatory notions whatever about philosophy.

Logic might have been defined as the science of thought, and of its laws and characteristic forms. But thought, as thought, constitutes only the general medium, or qualifying circumstance, which renders the Idea distinctively logical. If we identify the Idea with thought, thought must not be taken in the sense of a method or form, but in the sense of the self-developing totality of its laws and peculiar terms. These laws are the work of thought itself, and not a fact which it finds and must submit to.

From different points of view, Logic is either the hardest or the easiest of the sciences. Logic is hard, because it has to deal not with perceptions, nor, like geometry, with abstract representations of the senses, but with the pure abstractions; and because it demands a force and facility of withdrawing into pure thought, of keeping firm hold on it, and of moving in such an element. Logic is easy, because its facts are nothing but our own thought and its familiar forms or terms: and these are the acme of simplicity, the ABC of everything else. They are also what we are best acquainted with:

such as ‘is’ and ’is not’; quality and magnitude; being potential and being actual; one, many, and so on. But such an acquaintance only adds to the difficulties of the study; for while, on the one hand, we naturally think it is not worth our trouble to occupy ourselves any longer with things so familiar, on the other hand, the problem is to become acquainted with them in a new way, quite opposite to that in which we know them already.

The utility of Logic is a matter which concerns its bearings upon the student, and the training it may give for other purposes. This logical training consists in the exercise in thinking which the student has to go through (this science is the thinking of thinking): and in the fact that he stores his head with thoughts, in their native unalloyed character. It is true that Logic, being the absolute form of truth, and another name for the very truth itself, is something more than merely useful. Yet if what is noblest, most liberal, and most independent is also most useful, Logic has some claim to the latter character. Its utility must then be estimated at another rate than exercise in thought for the sake of the exercise.

§ 19n

(1) The first question is: What is the object of our science? The simplest and most intelligible answer to this question is that Truth is the object of Logic. Truth is a noble word, and the thing is nobler still. So long as man is sound at heart and in spirit, the search for truth must awake all the enthusiasm of his nature. But immediately there steps in the objection — are we able to know truth ? There seems to be a disproportion between finite beings like ourselves and the truth which is absolute, and doubts suggest themselves whether there is any bridge between the finite and the infinite. God is truth: how shall we know Him? Such an undertaking appears to stand in contradiction with the graces of lowliness and humility. Others who ask whether we can know the truth have a different purpose.

They want to justify themselves in living on contented with their petty, finite aims. And humility of this stamp is a poor thing.

But the time is past when people asked: How shall I, a poor worm of the dust, be able to know the truth ? And in its stead we find vanity and conceit: people claim, without any trouble on their part, to breathe the very atmosphere of truth. The young have been flattered into the belief that they possess a natural birthright of moral and religious truth. And in the same strain, those of riper years are declared to be sunk, petrified ossified in falsehood. Youth, say these teachers, sees the bright light of dawn: but the older generation lies in the slough and mire of the common day. They admit that the special sciences are something that certainly ought to be cultivated, but merely as the means to satisfy the needs of outer life. In all this it is not humility which holds back from the knowledge and study of the truth, but a conviction that we are already in full possession of it. And no doubt the young carry with them the hopes of their elder compeers; on them rests the advance of the world and science. But these hopes are set upon the young, only on the condition that, instead of remaining as they are, they undertake the stern labour of mind.

This modesty in truth-seeking has still another phase: and that is the genteel indifference to truth, as we see it in Pilate's conversation with Christ. Pilate asked 'What is truth ?' with the air of a man who had settled accounts with everything long ago, and concluded that nothing particularly matters — he meant much the same as Solomon when he says: 'All is vanity'. When it comes to this, nothing is left but self-conceit.

The knowledge of the truth meets an additional obstacle in timidity. A slothful mind finds it natural to say: 'Don't let it be supposed that we mean to be in earnest with our philosophy. We shall be glad *inter alia* to study Logic: but Logic must be sure to leave us as we were before.' People have a feeling that, if thinking passes the ordinary range of our ideas and

impressions, it cannot but be on the evil road. They seem to be trusting themselves to a sea on which they will be tossed to and fro by the waves of thought, till at length they again reach the sandbank of this temporal scene, as utterly poor as when they left it. What comes of such a view, we see in the world. It is possible within these limits to gain varied information and many accomplishments, to become a master of official routine, and to be trained for special purposes. But it is quite another thing to educate the spirit for the higher life and to devote our energies to its service. In our own day it may be hoped a longing for something better has sprung up among the young, so that they will not be contented with the mere straw of outer knowledge.

(2) It is universally agreed that thought is the object of Logic. But of thought our estimate may be very mean, or it may be very high. On one hand, people say: ‘It is only a thought.’ In their view thought is subjective, arbitrary and accidental — distinguished from the thing itself, from the true and the real. On the other hand, a very high estimate may be formed of thought; when thought alone is held adequate to attain the highest of all things, the nature of God, of which the senses can tell us nothing. God is a spirit, it is said, and must be worshipped in spirit and in truth. But the merely felt and sensible, we admit, is not the spiritual; its heart of hearts is in thought; and only spirit can know spirit. And though it is true that spirit can demean itself as feeling and sense — as is the case in religion, the mere feeling, as a mode of consciousness, is one thing, and its contents another. Feeling, as feeling, is the general form of the sensuous nature which we have in common with the brutes. This form, viz. feeling, may possibly seize and appropriate the full organic truth: but the form has no real congruity with its contents. The form of feeling is the lowest in which spiritual truth can be expressed. The world of spiritual existences, God himself, exists in proper truth, only in thought and as thought. If this be so, therefore, thought,

far from being a mere thought, is the highest and, in strict accuracy, the sole mode of apprehending the eternal and absolute.

As of thought, so also of the science of thought, a very high or a very low opinion may be formed. Any man, it is supposed, can think without Logic, as he can digest without studying physiology. If he has studied Logic, he thinks afterwards as he did before, perhaps more methodically, but with little alteration. If this were all, and if Logic did no more than make men acquainted with the action of thought as the faculty of comparison and classification, it would produce nothing which had not been done quite as well before. And in point of fact Logic hitherto had no other idea of its duty than this. Yet to be well informed about thought, even as a mere activity of the subject-mind, is honourable and interesting for man. It is in knowing what he is and what he does that man is distinguished from the brutes. But we may take the higher estimate of thought — as what alone can get really in touch with the supreme and true. In that case, Logic as the science of thought occupies a high ground. If the science of Logic then considers thought in its action and its productions (and thought being no resultless energy produces thoughts and the particular thought required), the theme of Logic is in general the supersensible world, and to deal with that theme is to dwell for a while in that world. Mathematics is concerned with the abstractions of time and space. But these are still the object of sense, although the sensible is abstract and idealised. Thought bids *adieu* even to this last and abstract sensible: it asserts its own native independence, renounces the field of the external and internal sense, and puts away the interests and inclinations of the individual. When Logic takes this ground, it is a higher science than we are in the habit of supposing.

(3) The necessity of understanding Logic in a deeper sense than as the science of the mere form of thought is enforced by the interests of religion and politics, of law and morality. In earlier days men meant no harm by

thinking: they thought away freely and fearlessly. They thought about God, about Nature, and the State; and they felt sure that a knowledge of the truth was obtainable through thought only, and not through the senses or any random ideas or opinions. But while they so thought, the principal ordinances of life began to be seriously affected by their conclusions. Thought deprived existing institutions of their force. Constitutions fell a victim to thought: religion was assailed by thought: firm religious beliefs which had been always looked upon as revelations were undermined, and in many minds the old faith was upset. The Greek philosophers, for example, became antagonists of the old religion, and destroyed its beliefs. Philosophers were accordingly banished or put to death, as revolutionists who had subverted religion and the state, two things which were inseparable. Thought, in short, made itself a power in the real world, and exercised enormous influence. The matter ended by drawing attention to the influence of thought, and its claims were submitted to a more rigorous scrutiny, by which the world professed to find that thought arrogated too much and was unable to perform what it had undertaken It had not — people said — learned the real being of God, of Nature and Mind. It had not learned what the truth was. What it had done was to overthrow religion and the state It became urgent therefore to justify thought, with reference to the results it had produced: and it is this examination into the nature of thought and this justification which in recent times has constituted one of the main problems of philosophy.

Thought regarded as an activity

§ 20

If we take our *prima facie* impression of thought, we find on examination first (a) that, in its usual subjective acceptation, thought is one out of many

activities or faculties of the mind, coordinate with such others as sensation, perception, imagination, desire, volition, and the like. The product of this activity, the form or character peculiar to thought, is the UNIVERSAL, or, in general, the abstract. Thought, regarded as an *activity*, may be accordingly described as the *active* universal, and, since the deed, its product, is the universal once more, may be called the self-actualising universal. Thought conceived as a *subject* (agent) is a thinker, and the subject existing as a thinker is simply denoted by the term ‘I’.

The distinction between Sense, Conception, and Thought.

The propositions giving an account of thought in this and the following sections are not offered as assertions or opinions of mine on the matter. But in these preliminary chapters any deduction or proof would be impossible, and the statements may be taken as matters in evidence. In other words, every man, when he thinks and considers his thoughts, will discover by the experience of his consciousness that they possess the character of universality as well as the other aspects of thought to be afterwards enumerated. We assume of course that his powers of attention and abstraction have undergone a previous training, enabling him to observe correctly the evidence of his consciousness and his conceptions.

This introductory exposition has already alluded to the distinction between Sense, Conception, and Thought. As the distinction is of capital importance for understanding the nature and kinds of knowledge, it will help to explain matters if we here call attention to it. For the explanation of *Sense,* the readiest method certainly is to refer to its external source — the organs of sense. But to name the organ does not help much to explain what is apprehended by it. The real distinction between sense and thought lies in this — that the essential feature of the sensible is individuality, and as the individual (which, reduced to its simplest terms, is the atom) is also a member of a group, sensible existence presents a number of mutually

exclusive units — of units, to speak in more definite and abstract formulae, which exist side by side with, and after, one another. *Conception* or picture-thinking works with materials from the same sensuous source. But these materials when *conceived* are expressly characterised as in me and therefore mine; and secondly, as universal, or simple, because only referred to self. Nor is sense the only source of materialised conception. There are conceptions constituted by materials emanating from self-conscious thought, such as those of law, morality, religion, and even of thought itself, and it requires some effort to detect wherein lies the difference between such conceptions and thoughts having the same import. For it is a thought of which such conception is the vehicle, and there is no want of the form of universality, without which no content could be in me, or be a conception at all. Yet here also the peculiarity of conception is, generally speaking, to be sought in the individualism or isolation of its contents. True it is that, for example, law and legal provisions do not exist in a sensible space, mutually excluding one another. Nor as regards time, though they appear to some extent in succession, are their contents themselves conceived as affected by time, or as transient and changeable in it. The fault in conception lies deeper. These ideas, though implicitly possessing the organic unity of mind, stand isolated here and there on the broad ground of conception, with its inward and abstract generality. Thus cut adrift, each is simple, unrelated: Right, Duty, God. Conception in these circumstances either rests satisfied with declaring that Right is Right, God is God; or in a higher grade of culture it proceeds to enunciate the attributes: as, for instance, God is the Creator of the world, omniscient, almighty, etc. In this way several isolated, simple predicates are strung together: but in spite of the link supplied by their subject, the predicates never get beyond mere contiguity. In this point Conception coincides with Understanding: the only distinction being that the latter introduces relations of universal and particular, of cause and

effect, etc., and in this way supplies a necessary connection to the isolated ideas of conception; which last has left them side by side in its vague mental spaces, connected only by a bare ‘and’.

The difference between conception and thought is of special importance: because philosophy may be said to do nothing but transform conceptions into thoughts – though it works the further transformation of a mere thought into a notion. Sensible existence has been characterized by the attributes of individuality and mutual exclusion of the members. It is well to remember that these very attributes of sense are thoughts and general terms. It will be shown in the Logic that thought (and the universal) is not a mere opposite of sense: it lets nothing escape it, but, outflanking its other, is at once that other and itself. Now language is the work of thought: and hence all that is expressed in language must be universal. What I only mean or suppose is mine: it belongs to me — this particular individual. But language expresses nothing but universality; and so I cannot say what I merely *mean.* And the unutterable — feeling or sensation — far from being the highest truth, is the most unimportant and untrue. If I say ‘the individual’, ‘this individual’, ‘here’, ‘now’, all these are universal terms. Everything and anything is an individual, a ‘this’, and if it be sensible, is here and now. Similarly when I say ‘I’, I *mean* my single self to the exclusion of all others; but what I *say,* viz. ‘I’, is just every ‘I’, which in like manner excludes all others from itself. In an awkward expression which Kant used, he said that I *accompany* all my conceptions — sensations, too, desires, actions, etc. ‘I’ is in essence and act the universal: and such partnership is a form, though an external form, of universality. All other men have it in common with me to be ‘I’; just as it is common to all my sensations and conceptions to be mine. But ‘I’, in the abstract, as such, is the mere act of self-concentration or self-relation, in which we make abstraction from all conception and feeling, from every state of mind and every peculiarity of nature, talent, and

experience. To this extent, ‘I’ is the existence of a wholly *abstract* universality, a principle of abstract freedom. Hence thought, viewed as a subject, is what is expressed by the word ‘I’; and since I am at the same time in all my sensations, conceptions, and states of consciousness, thought is everywhere present, and is a category that runs through all these modifications.

§ 20 n

Our first impression when we use the term ‘thought’ is of a subjective activity — one among many similar faculties, such as memory, imagination, and will. Were thought merely an activity of the subject-mind and treated under that aspect by Logic, Logic would resemble the other sciences in possessing a well-marked object. It might in that case seem arbitrary to devote a special science to thought, while will, imagination, and the rest were denied the same privilege. The selection of one faculty however might even in this view be very well grounded on a certain authority acknowledged to belong to thought, and on its claim to be regarded as the true nature of man, in which consists his distinction from the brutes. Nor is it unimportant to study thought even as a subjective energy. A detailed analysis of its nature would exhibit rules and laws, a knowledge of which is derived from experience. A treatment of the laws of thought, from this point of view, used once to form the body of logical science. Of that science Aristotle was the founder. He succeeded in assigning to thought what properly belongs to it. Our thought is extremely concrete; but in its composite contents we must distinguish the part that properly belongs to thought, or to the abstract mode of its action. A subtle spiritual bond, consisting in the agency of thought, is what gives unity to all these contents, and it was this bond, the form as form, that Aristotle noted and described. Up to the present day, the logic of Aristotle continues to be the received

system. It has indeed been spun out to greater length, especially by the labours of the medieval Schoolmen who, without making any material additions, merely refined in details. The moderns also have left their mark upon this logic, partly by omitting many points of logical doctrine due to Aristotle and the Schoolmen, and partly by foisting in a quantity of psychological matter. The purport of the science is to become acquainted with the procedure of finite thought: and, if it is adapted to its presupposed object, the science is entitled to be styled correct. The study of this formal logic undoubtedly has its uses. It sharpens the wits, as the phrase goes, and teaches us to collect our thoughts and to abstract — whereas in common consciousness we have to deal with sensuous conceptions which cross and perplex one another. Abstraction moreover implies the concentration of the mind on a single point, and thus induces the habit of attending to our inward selves. An acquaintance with the forms of finite thought may be made a means of training the mind for the empirical sciences, since their method is regulated by these forms: and in this sense logic has been designated Instrumental. It is true, we may be still more liberal, and say: Logic is to be studied not for its utility, but for its own sake; the superexcellent is not to be sought for the sake of mere utility. In one sense this is quite correct; but it may be replied that the superexcellent is also the most useful, because it is the all-sustaining principle which, having a subsistence of its own, may therefore serve as the vehicle of special ends which it furthers and secures. And thus, special ends, though they have no right to be set first, are still fostered by the presence of the highest good. Religion, for instance, has an absolute value of its own; yet at the same time other ends flourish and succeed in its train. As Christ says: 'Seek ye first the kingdom of God, and all these things shall be added unto you.' Particular ends can be attained only in the attainment of what absolutely is and exists in its own right.

Thought in its bearings upon objects

§ 21

(b) Thought was described as active. We now, in the second place, consider this action in its bearings upon objects, or as reflection upon something. In this case the universal or product of its operation contains the value of the thing — is the essential, inward, and true.

In § 5 the old belief was quoted that the reality in object, circumstance, or event, the intrinsic worth or essence, the thing on which everything depends, is not a self-evident datum of consciousness, or coincident with the first appearance and impression of the object; that, on the contrary, Reflection is required in order to discover the real constitution of the object — and that by such reflection it will be ascertained.

Universals apprehended in Reflection

§ 21n

To reflect is a lesson which even the child has to learn. One of his first lessons is to join adjectives with substantives. This obliges him to attend and distinguish: he has to remember a rule and apply it to the particular case. This rule is nothing but a universal: and the child must see that the particular adapts itself to this universal. In life, again, we have ends to attain. And with regard to these we ponder which is the best way to secure them. The end here represents the universal or governing principle and we have means and instruments whose action we regulate in conformity to the end. In the same way reflection is active in questions of conduct. To reflect here means to recollect the right, the duty — the universal which serves as a fixed rule to guide our behaviour in the given case. Our particular act must imply and recognise the universal law. We find the same thing exhibited in our study of natural phenomena. For instance, we observe thunder and lightning. The phenomenon is a familiar one, and we often perceive it. But

man is not content with a bare acquaintance, or with the fact as it appears to the senses; he would like to get behind the surface, to know what it is, and to comprehend it. This leads him to reflect: he seeks to find out the cause as something distinct from the mere phenomenon: he tries to know the inside in its distinction from the outside. Hence the phenomenon becomes double, it splits into inside and outside, into force and its manifestation, into cause and effect. Once more we find the inside or the force identified with the universal and permanent: not this or that flash of lightning, this or that plant — but that which continues the same in them all. The sensible appearance is individual and evanescent: the permanent in it is discovered by reflection.

Nature shows us a countless number of individual forms and phenomena. Into this variety we feel a need of introducing unity: we compare, consequently, and try to find the universal of each single case. Individuals are born and perish: the species abides and recurs in them all: and its existence is only visible to reflection. Under the same head fall such laws as those regulating the motion of the heavenly bodies. To-day we see the stars here, and tomorrow there; and our mind finds something incongruous in this chaos — something in which it can put no faith, because it believes in order and in a simple, constant, and universal law. Inspired by this belief, the mind has directed its reflection towards the phenomena, and learnt their laws. In other words, it has established the movement of the heavenly bodies to be in accordance with a universal law from which every change of position may be known and predicted. The case is the same with the influences which make themselves felt in the infinite complexity of human conduct. There, too, man has the belief in the sway of a general principle. From all these examples it may be gathered how reflection is always seeking for something fixed and permanent, definite in itself and governing the particulars. This universal which cannot be apprehended by the senses counts as the true and essential. Thus, duties and rights are all-important in

the matter of conduct; and an action is true when it conforms to those universal formulae.

In thus characterising the universal, we become aware of its antithesis to something else. This something else is the merely immediate, outward and individual, as opposed to the mediate, inward, and universal. The universal does not exist externally to the outward eye as a universal. The kind as kind cannot be perceived: the laws of the celestial motions are not written on the sky. The universal is neither seen nor heard, its existence is only for the mind. Religion leads us to a universal, which embraces all else within itself, to an Absolute by which all else is brought into being: and this Absolute is an object not of the senses but of the mind and of thought.

The Subject-Object Relation

§ 22

(c) By the act of reflection something is *altered* in the way in which the fact was originally presented in sensation, perception, or conception. Thus, as it appears, an alteration must be interposed before the true nature of the object can be discovered.

What reflection elicits is a product of our thought. Solon, for instance, produced out of his head the laws he gave to the Athenians. This is half of the truth: but we must not on that account forget that the universal (in Solon's case, the laws) is the very reverse of merely subjective, or fail to note that it is the essential, true, and objective being of things. To discover the truth in things, mere attention is not enough; we must call in the action of our own faculties to transform what is immediately before us. Now, at first sight, this seems an inversion of the natural order, calculated to thwart the very purpose on which knowledge is bent. But the method is not so irrational as it seems. It has been the conviction of every age that the only

way of reaching the permanent substratum was to transmute the given phenomenon by means of reflection. In modern times a doubt has for the first time been raised on this point in connection with the difference alleged to exist between the products of our thought and the things in their own nature. This real nature of things, it is said, is very different from what we make out of them.

Kantian Scepticism

The divorce between thought and thing is mainly the work of the Critical Philosophy, and runs counter to the conviction of all previous ages, that their agreement was a matter of course. The antithesis between them is the hinge on which modern philosophy turns. Meanwhile the natural belief of men gives the lie to it. In common life we reflect, without particularly reminding ourselves that this is the process of arriving at the truth, and we think without hesitation, and in the firm belief that thought coincides with thing. And this belief is of the greatest importance. It marks the diseased state of the age when we see it adopt the despairing creed that our knowledge is only subjective, and that beyond this subjective we cannot go. Whereas, rightly understood, truth is objective, and ought so to regulate the conviction of every one, that the conviction of the individual is stamped as wrong when it does not agree with this rule. Modem views, on the contrary, put great value on the mere fact of conviction, and hold that to be convinced is good for its own sake, whatever be the burden of our conviction — there being no standard by which we can measure its truth.

We said above that, according to the old belief, it was the characteristic right of the mind to know the truth. If this be so, it also implies that everything we know both of outward and inward nature, in one word, the objective world, is in its own self the same as it is in thought, and that to think is to bring out the truth of our object, be it what it may. The business of philosophy is only to bring into explicit consciousness what the world in

all ages has believed about thought. Philosophy therefore advances nothing new; and our present discussion has led us to a conclusion which agrees with the natural belief of mankind.

“Think for Yourself”[note]

§ 23

(d) The real nature of the object is brought to light in reflection; but it is no less true that this exertion of thought is *my* act. If this be so, the real nature is a *product* of *my* mind, in its character of thinking subject — generated by me in my simple universality, self-collected and removed from extraneous influences — in one word, in my Freedom.

‘Think for yourself’ is a phrase which people often use as if it had some special significance. The fact is, no man can think for another, any more than he can eat or drink for him and the expression is a pleonasm. To think is in fact *ipso facto* to be free, for thought as the action of the universal is an abstract relating of self to self, where, being at home with ourselves, and as regards our subjectivity utterly blank, our consciousness is, in the matter of its contents, only in the fact and its characteristics. If this be admitted, and if we apply the term humility or modesty to an attitude where our subjectivity is not allowed to interfere by act or quality, it is easy to appreciate the question touching the humility or modesty and pride of philosophy. For in point of contents, thought is only true in proportion as it sinks itself in the facts; and in point of form it is no private or particular state or act of the subject, but rather that attitude of consciousness where the abstract self, freed from all the special limitations to which its ordinary states or qualities are liable, restricts itself to that universal action in which it is identical with all individuals. In these circumstances philosophy may be acquitted of the charge of pride. And when Aristotle summons the mind to rise to the

dignity of that attitude, the dignity he seeks is won by letting slip all our individual opinions and prejudices, and submitting to the sway of the fact.

The Objectivity of Thought

§ 24

With these explanations and qualifications, thoughts may be termed Objective Thoughts — among which are also to be included the forms which are more especially discussed in the common logic, where they are usually treated as forms of conscious thought only. *Logic therefore coincides with Metaphysics, the science of things set and held in thoughts* — thoughts accredited able to express the essential reality of things.

An exposition of the relation in which such forms as notion, judgment, and syllogism stand to others, such as causality, is a matter for the science itself. But this much is evident beforehand. If thought tries to form a notion of things, this notion (as well as its proximate phases, the judgment and syllogism) cannot be composed of articles and relations which are alien and irrelevant to the things. Reflection, it was said above, conducts to the universal of things: which universal is itself one of the constituent factors of a notion. To say that Reason or Understanding is in the world, is equivalent in its import to the phrase 'Objective Thought'. The latter phrase however has the inconvenience that thought is usually confined to express what belongs to the mind or consciousness only, while objective is a term applied, at least primarily, only to the non-mental.

§ 24 n

(1) To speak of thought or objective thought as the heart and soul of the world, may seem to be ascribing consciousness to the things of nature. We feel a certain repugnance against making thought the inward function of

things, especially as we speak of thought as marking the divergence of man from nature. It would be necessary, therefore, if we use the term thought at all, to speak of nature as the system of unconscious thought, or, to use Schelling's expression, a petrified intelligence. And in order to prevent misconception, 'thought-form' or 'thought-type' should be substituted for the ambiguous term thought.

From what has been said the principles of logic are to be sought in a system of thought-types or fundamental categories, in which the opposition between subjective and objective, in its usual sense vanishes. The signification thus attached to thought and its characteristic forms may be illustrated by the ancient saying that '□□□□ governs the world', or by our own phrase that 'Reason is in the world'; which means that Reason is the soul of the world it inhabits, its immanent principle, its most proper and inward nature, its universal. Another illustration is offered by the circumstance that in speaking of some definite animal we say it is (an) animal. Now, the animal, qua animal, cannot be shown; nothing can be pointed out excepting some special animal. Animal, qua animal, does not exist: it is merely the universal nature of the individual animals, while each existing animal is a more concretely defined and particularised thing. But to be an animal — the law of kind which is the universal in this case — is the property of the particular animal, and constitutes its definite essence. Take away from the dog its animality, and it becomes impossible to say what it is. All things have a permanent inward nature, as well as an outward existence. They live and die, arise and pass away; but their essential and universal part is the kind; and this means much more than something common to them all.

If thought is the constitutive substance of external things, it is also the universal substance of what is spiritual. In all human perception thought is present; so too thought is the universal in all the acts of conception and recollection; in short, in every mental activity, in willing, wishing, and the

like. All these faculties are only further specialisations of thought. When it is presented in this light, thought has a different part to play from what it has if we speak of a faculty of thought, one among a crowd of other faculties, such as perception, conception, and will, with which it stands on the same level. When it is seen to be the true universal of all that nature and mind contain, it extends its scope far beyond all these, and becomes the basis of everything. From this view of thought, in its objective meaning as *nous*, we may next pass to consider the subjective sense of the term. We say first, Man is a being that thinks; but we also say at the same time, Man is a being that perceives and wills. Man is a thinker, and is universal; but he is a thinker only because he feels his own universality. The animal too is by implication universal, but the universal is not consciously felt by it to be universal: it feels only the individual. The animal sees a singular object, for instance, its food, or a man. For the animal all this never goes beyond an individual thing. Similarly, sensation has to do with nothing but singulars, such as this pain or this sweet taste. Nature does not bring its nous into consciousness: it is man who first makes himself double so as to be a universal for a universal. This first happens when man knows that he is ‘I’. By the term ‘I’ I mean myself, a single and altogether determinate person. And yet I really utter nothing peculiar to myself, for every one else is an ‘I’ or ‘Ego’, and when I call myself ‘I’, though I indubitably mean the single person myself, I express a thorough universal. ‘I’, therefore, is mere being-for-self, in which everything peculiar or marked is renounced and buried out of sight; it is as it were the ultimate and unanalysable point of consciousness. We may say ‘I’ and thought are the same, or, more definitely, ‘I’ is thought as a thinker. What I have in my consciousness is for me. ‘I’ is the vacuum or receptacle for anything and everything: for which everything is and which stores up everything in itself. Every man is a whole world of conceptions, that lie buried in the night of the ‘Ego’. It follows that

the ‘Ego’ is the universal in which we leave aside all that is particular, and in which at the same time all the particulars have a latent existence. In other words, it is not a mere universality and nothing more, but the universality which includes in it everything. Commonly we use the word ‘I’ without attaching much importance to it, nor is it an object of study except to philosophical analysis. In the ‘Ego’, we have thought before us in its utter purity. While the brute cannot say ‘I’, man can, because it is his nature to think. Now in the ‘Ego’ there are a variety of contents, derived both from within and from without, and according to the nature of these contents our state may be described as perception, or conception, or reminiscence. But in all of them the ‘I’ is found: or in them all thought is present. Man, therefore, is always thinking, even in his perceptions: if he observes anything, he always observes it as a universal, fixes on a single point which he places in relief, thus withdrawing his attention from other points, and takes it as abstract and universal, even if the universality be only in form.

In the case of our ordinary conceptions, two things may happen. Either the contents are moulded by thought, but not the form; or, the form belongs to thought and not the contents. In using such terms, for instance, as anger, rose, hope, I am speaking of things which I have learnt in the way of sensation, but I express these contents in a universal mode, that is, in the form of thought. I have left out much that is particular and given the contents in their generality: but still the contents remain sense-derived. On the other hand, when I represent God, the content is undeniably a product of pure thought, but the form still retains the sensuous limitations which it has as I find it immediately present in myself. In these generalised images the content is not merely and simply sensible, as it is in a visual inspection; but either the content is sensuous and the form appertains to thought, or vice versa. In the first case the material is given to us, and our thought supplies the form: in the second case the content which has its source in thought is

by means of the form turned into a something given, which accordingly reaches the mind from without.

(2) Logic is the study of thought pure and simple, or of the pure thought-forms. In the ordinary sense of the term, by thought we generally represent to ourselves something more than simple and unmixed thought; we mean some thought, the material of which is from experience. Whereas in logic a thought is understood to include nothing else but what depends on thinking and what thinking has brought into existence. It is in these circumstances that thoughts are pure thoughts. The mind is then in its own home-element and therefore free; for freedom means that the other thing with which you deal is a second self — so that you never leave your own ground but give the law to yourself. In the impulses or appetites the beginning is from something else, from something which we feel to be external. In this case then we speak of dependence. For freedom it is necessary that we should feel no presence of something else which is not ourselves. The natural man, whose motions follow the rule only of his appetites, is not his own master. Be he as self-willed as he may, the constituents of his will and opinion are not his own, and his freedom is merely formal. But when we think, we renounce our selfish and particular being, sink ourselves in the thing, allow thought to follow its own course, and if we add anything of our own, we think ill.

If in pursuance of the foregoing remarks we consider Logic to be the system of the pure types of thought, we find that the other philosophical sciences, the Philosophy of Nature and the Philosophy of Mind, take the place, as it were, of an Applied Logic, and that Logic is the soul which animates them both. Their problem in that case is only to recognise the logical forms under the shapes they assume in Nature and Mind — shapes which are only a particular mode of expression for the forms of pure thought. If for instance we take the syllogism (not as it was understood in

the old formal logic, but as its real value), we shall find it gives expression to the law that the particular is the middle term which fuses together the extremes of the universal and the singular.

The syllogistic form is a universal form of all things. Everything that exists is a particular, which couples together the universal and the singular. But Nature is weak and fails to exhibit the logical forms in their purity. Such a feeble exemplification of the syllogism may be seen in the magnet. In the middle or point of indifference of a magnet, its two poles, however they may be distinguished, are brought into one. Physics also teaches us to see the universal or essence in Nature: and the only difference between it and the Philosophy of Nature is that the latter brings before our mind the adequate forms of the notion in the physical world.

It will now be understood that Logic is the all-animating spirit of all the sciences, and its categories the spiritual hierarchy. They are the heart and centre of things: and yet at the same time they are always on our lips, and, apparently at least, perfectly familiar objects. But things thus familiar are usually the greatest strangers. Being, for example, is a category of pure thought: but to make 'is' an object of investigation never occurs to us. Common fancy puts the Absolute far away in a world beyond. The Absolute is rather directly before us, so present that so long as we think, we must, though without express consciousness of it, always carry it with us and always use it. Language is the main depository of these types of thought; and one use of the grammatical instruction which children receive is unconsciously to turn their attention to distinctions of thought.

Logic is usually said to be concerned with forms only and to derive the material for them from elsewhere. But this 'only', which assumes that the logical thoughts are nothing in comparison with the rest of the contents, is not the word to use about forms which are the absolutely real ground of everything. Everything else rather is an 'only' compared with these

thoughts. To make such abstract forms a problem presupposes in the inquirer a higher level of culture than ordinary; and to study them in themselves and for their own sake signifies in addition that these thought-types must be deduced out of thought itself, and their truth or reality examined by the light of their own laws. We do not assume them as data from without, and then define them or exhibit their value and authority by comparing them with the shape they take in our minds. If we thus acted, we should proceed from observation and experience, and should, for instance, say we habitually employ the term 'force' in such a case, and such a meaning. A definition like that would be called correct, if it agreed with the conception of its object present in our ordinary state of mind. The defect of this empirical method is that a notion is not defined as it is in and for itself, but in terms of something assumed, which is then used as a criterion and standard of correctness. No such test need be applied: we have merely to let the thought-forms follow the impulse of their own organic life.

To ask if a category is true or not, must sound strange to the ordinary mind: for a category apparently becomes true only when it is applied to a given object, and apart from this application it would seem meaningless to inquire into the truth. But this is the very question on which every thing turns. We must however in the first place understand clearly what we mean by Truth. In common life truth means the agreement of an object with our conception of it. We thus presuppose an object to which our conception must conform. In the philosophical sense of the word, on the other hand, truth may be described, in general abstract terms, as the agreement of a thought-content with itself. This meaning is quite different from the one given above. At the same time the deeper and philosophical meaning of truth can be partially traced even in the ordinary usage of language. Thus we speak of a true friend; by which we mean a friend whose manner of conduct accords with the notion of friendship. In the same way we speak of

a true work of Art. Untrue in this sense means the same as bad, or self-discordant. In this sense a bad state is an untrue state; and evil and untruth may be said to consist in the contradiction subsisting between the function or notion and the existence of the object. Of such a bad object we may form a correct representation, but the import of such representation is inherently false. Of these correctnesses, which are at the same time untruths, we may have many in our heads. God alone is the thorough harmony of notion and reality. All finite things involve an untruth: they have a notion and an existence, but their existence does not meet the requirements of the notion. For this reason they must perish, and then the incompatibility between their notion and their existence becomes manifest. It is in the kind that the individual animal has its notion; and the kind liberates itself from this individuality by death.

The study of truth, or, as it is here explained to mean, consistency, constitutes the proper problem of logic. In our everyday mind we are never troubled with questions about the truth of the forms of thought. We may also express the problem of logic by saying that it examines the forms of thought touching their capability to hold truth. And the question comes to this: What are the forms of the infinite, and what are the forms of the finite ? Usually no suspicion attaches to the finite forms of thought; they are allowed to pass unquestioned. But it is from conforming to finite categories in thought and action that all deception originates.

(3) Truth may be ascertained by several methods, each of which however is no more than a form. Experience is the first of these methods. But the method is only a form: it has no intrinsic value of its own. For in experience everything depends upon the mind we bring to bear upon actuality. A great mind is great in its experience; and in the motley play of phenomena at once perceives the point of real significance. The idea is present, in actual shape, not something, as it were, over the hill and far away. The genius of a

Goethe, for example, looking into nature or history, has great experiences, catches sight of the living principle, and gives expression to it.
A second method of apprehending the truth is Reflection, which defines it by intellectual relations of condition and conditioned. But in these two modes the absolute truth has not yet found its appropriate form. The most perfect method of knowledge proceeds in the pure form of thought: and here the attitude of man is one of entire freedom.

That the form of thought is the perfect form, and that it presents the truth as it intrinsically and actually is, is the general dogma of all philosophy. To give a proof of the dogma there is, in the first instance, nothing to do but show that these other forms of knowledge are finite. The grand Scepticism of antiquity accomplished this task when it exhibited the contradictions contained in every one of these forms. That Scepticism indeed went further: but when it ventured to assail the forms of reason, it began by insinuating under them something finite upon which it might fasten. All the forms of finite thought will make their appearance in the course of logical development, the order in which they present themselves being determined by necessary laws. Here in the introduction they could only be unscientifically assumed as something given. In the theory of logic itself these forms will be exhibited, not only on their negative, but also on their positive side.

When we compare the different forms of ascertaining truth with one another, the first of them, immediate knowledge, may perhaps seem the finest, noblest, and most appropriate. It includes everything which the moralists term innocence as well as religious feeling, simple trust, love, fidelity, and natural faith. The two other forms, first reflective, and secondly philosophical cognition, must leave that unsought natural harmony behind. And so far as they have this in common, the methods which claim to apprehend the truth by thought may naturally be regarded as part and parcel

of the pride which leads man to trust to his own powers for a knowledge of the truth. Such a position involves a thorough-going disruption, and, viewed in that light, might be regarded as the source of all evil and wickedness — the original transgression. Apparently therefore the only way of being reconciled and restored to peace is to surrender all claims to think or know.

This lapse from natural unity has not escaped notice, and nations from the earliest times have asked the meaning of the wonderful division of the spirit against itself. No such inward disunion is found in nature: natural things do nothing wicked.

The tales and allegories of religion

The Mosaic legend of the Fall of Man has preserved an ancient picture representing the origin and consequences of this disunion. The incidents of the legend form the basis of an essential article of the creed, the doctrine of original sin in man and his consequent need of succour . It may be well at the commencement of logic to examine the story which treats of the origin and the bearings of the very knowledge which logic has to discuss. For, though philosophy must not allow herself to be overawed by religion, or accept the position of existence on sufferance, she cannot afford to neglect these popular conceptions. The tales and allegories of religion, which have enjoyed for thousands of years the veneration of nations, are not to be set aside as antiquated even now.

Upon a closer inspection of the story of the Fall we find, as was already said, that it exemplifies the universal bearings of knowledge upon the spiritual life. In its instinctive and natural stage, spiritual life wears the garb of innocence and confiding simplicity; but the very essence of spirit implies the absorption of this immediate condition in something higher. The spiritual is distinguished from the natural, and more especially from the animal, life, in the circumstance that it does not continue a mere stream of tendency, but sunders itself to self-realisation. But this position of severed

life has in its turn to be suppressed, and the spirit has by its own act to win its way to concord again. The final concord then is spiritual; that is, the principle of restoration is found in thought, and thought only. The hand that inflicts the wound is also the hand which heals it.

We are told in our story that Adam and Eve, the first human beings, the types of humanity, were placed in a garden, where grew a tree of life and a tree of the knowledge of good and evil. God, it is said, had forbidden them to eat of the fruit of this latter tree: of the tree of life for the present nothing further is said. These words evidently assume that man is not intended to seek knowledge, and ought to remain in the state of innocence. Other meditative races, it may be remarked, have held the same belief that the primitive state of mankind was one of innocence and harmony. Now all this is to a certain extent correct. The disunion that appears throughout humanity is not a condition to rest in. But it is a mistake to regard the natural and immediate harmony as the right state. The mind is not mere instinct: on the contrary, it essentially involves the tendency to reasoning and meditation. Childlike innocence no doubt has in it something fascinating and attractive: but only because it reminds us of what the spirit must win for itself. The harmoniousness of childhood is a gift from the hand of nature: the second harmony must spring from the labour and culture of the spirit. And so the words of Christ, 'Except ye *become* as little children', etc., are very far from telling us that we must always remain children.

Again, we find in the narrative of Moses that the occasion which led man to leave his natural unity is attributed to solicitation from without. The serpent was the tempter. But the truth is, that the step into opposition, the awakening of consciousness, follows from the very nature of man; and the same history repeats itself in every son of Adam. The serpent represents likeness to God as consisting in the knowledge of good and evil: and it is just this knowledge in which man participates when he breaks with the

unity of his instinctive being and eats of the forbidden fruit. The first reflection of awakened consciousness in men told them that they were naked. This is a naive and profound trait. For the sense of shame bears evidence to the separation of man from his natural and sensuous life. The beasts never get so far as this separation, and they feel no shame. And it is in the human feeling of shame that we are to seek the spiritual and moral origin of dress, compared with which the merely physical need is a secondary matter.

Next comes the Curse, as it is called, which God pronounced upon man. The prominent point in that curse turns chiefly on the contrast between man and nature. Man must work in the sweat of his brow: and woman bring forth in sorrow. As to work, if it is the result of the disunion, it is also the victory over it. The beasts have nothing more to do but to pick up the materials required to satisfy their wants: man on the contrary can only satisfy his wants by himself producing and transforming the necessary means. Thus even in these outside things man is dealing with himself.

The story does not close with the expulsion from Paradise. We are further told, God said, 'Behold Adam is become as one of us, to know good and evil.' Knowledge is now spoken of as divine, and not, as before, as something wrong and forbidden. Such words contain a confutation of the idle talk that philosophy pertains only to the finitude of the mind. Philosophy is knowledge, and it is through knowledge that man first realises his original vocation, to be the image of God. When the record adds that God drove men out of the garden of Eden to prevent their eating of the tree of life, it only means that on his natural side certainly man is finite and mortal, but in knowledge infinite.

We all know the theological dogma that man's nature is evil, tainted with what is called Original Sin. Now while we accept the dogma, we must give up the setting of incident which represents original sin as consequent upon

an accidental act of the first man. For the very notion of spirit is enough to show that man is evil by nature, and it is an error to imagine that he could ever be otherwise. To such extent as man is and acts like a creature of nature, his whole behaviour is what it ought not to be. For the spirit it is a duty to be free, and to realise itself by its own act. Nature is for man only the starting-point which he has to transform. The theological doctrine of original sin is a profound truth; but modem enlightenment prefers to believe that man is naturally good, and that he acts right so long as he continues true to nature.

The hour when man leaves the path of mere natural being marks the difference between him, a self-conscious agent, and the natural world. But this schism, though it forms a necessary element in the very notion of spirit, is not the final goal of man. It is to this state of inward breach that the whole finite action of thought and will belongs. In that finite sphere man pursues ends of his own and draws from himself the material of his conduct. While he pursues these aims to the uttermost, while his knowledge and his will seek himself, his own narrow self apart from the universal, he is evil; and his evil is to be subjective.

We seem at first to have a double evil here: but both are really the same. Man in so far as he is spirit is not the creature of nature: and when he behaves as such, and follows the cravings of appetite, he wills to be so. The natural wickedness of man is therefore unlike the natural life of animals. A mere natural life may be more exactly defined by saying that the natural man as such is an individual: for nature in every part is in the bonds of individualism. Thus when man wills to be a creature of nature, he wills in the same degree to be an individual simply. Yet against such impulsive and appetitive action, due to the individualism of nature, there also steps in the law or general principle. This law may either be an external force, or have the form of divine authority. So long as he continues in his natural state,

man is in bondage to the law. It is true that among the instincts and affections of man, there are social or benevolent inclinations, love, sympathy, and others, reaching beyond his selfish isolation. But so long as these tendencies are instinctive, their virtual universality of scope and purport is vitiated by the subjective form which always allows free play to self-seeking and random action.

The concrete formations of consciousness

§ 25

The term 'Objective Thoughts' indicates the truth — the truth which is to be the absolute *object* of philosophy, and not merely the goal at which it aims. But the very expression cannot fail to suggest an opposition, to characterise and appreciate which is the main motive of the philosophical attitude of the present time, and which forms the real problem of the question about truth and our means of ascertaining it. If the thought-forms are vitiated by a fixed antithesis, i.e. if they are only of a finite character, they are unsuitable for the self-centred universe of truth, and truth can find no adequate receptacle in thought. Such thought, which can produce only limited and partial categories and proceed by their means, is what in the stricter sense of the word is termed Understanding. The finitude, further, of these categories lies in two points. Firstly, they are only subjective, and the antithesis of an objective permanently clings to them. Secondly, they are always of restricted content, and so persist in antithesis to one another and still more to the Absolute. In order more fully to explain the position and import here attributed to logic, the attitudes in which thought is supposed to stand to objectivity will next be examined by way of further introduction.

In my *Phenomenology of the Spirit*, which on that account was at its publication described as the first part of the System of Philosophy, the

method adopted was to begin with the first and simplest phase of mind, immediate consciousness, and to show how that stage gradually of necessity worked onward to the philosophical point of view, the necessity of that view being proved by the process. But in these circumstances it was impossible to restrict the quest to the mere form of consciousness. For the stage of philosophical knowledge is the richest in material and organisation, and therefore, as it came before us in the shape of a result, it presupposed the existence of the concrete formations of consciousness, such as individual and social morality, art and religion. In the development of consciousness, which at first sight appears limited to the point of form merely, there is thus at the same time included the development of the matter or of the objects discussed in the special branches of philosophy. But the latter process must, so to speak, go on behind consciousness, since those facts are the essential nucleus which is raised into consciousness. The exposition accordingly is rendered more intricate, because so much that properly belongs to the concrete branches is prematurely dragged into the introduction. The survey which follows in the present work has even more the inconvenience of being only historical and inferential in its method. But it tries especially to show how the questions men have proposed, outside the school, on the nature of Knowledge, Faith, and the like — questions which they imagine to have no connection with abstract thoughts — are really reducible to the simple categories, which first get cleared up in Logic.

III. First Attitude of Thought to Objectivity

§ 26

THE FIRST OF these attitudes of thought is seen in the method which has no doubts and no sense of the contradiction in thought, or of the hostility of thought against itself. It entertains an unquestioning belief that reflection is the means of ascertaining the truth, and of bringing the objects before the mind as they really are. And in this belief it advances straight upon its objects, takes the materials furnished by sense and perception, and reproduces them from itself as facts of thought; and then, believing this result to be the truth, the method is content. Philosophy in its earliest stages, all the sciences, and even the daily action and movement of consciousness, live in this faith.

§ 27

This method of thought has never become aware of the antithesis of subjective and objective: and to that extent there is nothing to prevent its statements from possessing a genuinely philosophical and speculative character, though it is just as possible that they may never get beyond finite categories, or the stage where the antithesis is still unresolved. In the present introduction the main question for us is to observe this attitude of thought in its extreme form; and we shall accordingly first of all examine its second and inferior aspect as a philosophic system. One of the clearest instances of it, and one lying nearest to ourselves, may be found in the Metaphysic of the Past as it subsisted among us previous to the philosophy of Kant. It is however only in reference to the history of philosophy that this

Metaphysic can be said to belong to the past: the thing is always and at all places to be found, as the view which the abstract understanding takes of the objects of reason. And it is in this point that the real and immediate good lies in a closer examination of its main scope and its *modis operandi*.

§ 28

This metaphysical system took the laws and forms of thought to be the fundamental laws and forms of things. It assumed that to think a thing was the means of finding its very self and nature: and to that extent it occupied higher ground than the Critical Philosophy which succeeded it. But in the first instance (1) *these terms of thought were cut off from their connection,* their solidarity; each was believed valid by itself and capable of serving as a predicate of the truth. It was the general assumption of this metaphysic that a knowledge of the Absolute was gained by assigning predicates to it. It neither inquired what the terms of the understanding specially meant or what they were worth, nor did it test the method which characterises the Absolute by the assignment of predicates.

As an example of such predicates may be taken: Existence, in the proposition, ‘God has existence’; Finitude or Infinity, as in the question, ‘Is the world finite or infinite?’; Simple and Complex, in the proposition, ‘The Soul is simple’ or again, ‘The thing is a unity, a whole’, etc. Nobody asked whether such predicates had any intrinsic and independent truth, or if the propositional form could be a form of truth.

The Metaphysic of the past assumed, as unsophisticated belief always does, that thought apprehends the very self of things, and that things, to become what they truly are, require to be thought. For Nature and the human soul are a very Proteus in their perpetual transformations; and it soon occurs to the observer that the first crude impression of things is not their essential being. This is a point of view the very reverse of the result

arrived at by the Critical Philosophy; a result, of which it may be said, that it bade man go and feed on mere husks and chaff.

We must look more closely into the procedure of that old metaphysic. In the first place it never went beyond the province of the analytic understanding. Without preliminary inquiry it adopted the abstract categories of thought and let them rank as predicates of truth. But in using the term thought we must not forget the difference between finite or discursive thinking and the thinking which is infinite and rational. The categories, as they meet us *prima facie* and in isolation, are finite forms. But truth is always infinite, and cannot be expressed or presented to consciousness in finite terms. The phrase *infinite thought* may excite surprise, if we adhere to the modern conception that thought is always limited. But it is, speaking rightly, the very essence of thought to be infinite. The nominal explanation of calling a thing finite is that it has an end, that it exists up to a certain point only, where it comes into contact with, and is limited by, its other. The finite therefore subsists in reference to its other, which is its negation and presents itself as its limit. Now thought is always in its own sphere its relations are with itself, and it is its own object. In having a thought for object, I am at home with myself. The thinking power, the 'I', is therefore infinite, because, when it thinks, it is in relation to an object which is itself. Generally speaking, an object means a something else, a negative confronting me. But in the case where thought thinks itself, it has an object which is at the same time no object: in other words, its objectivity is suppressed and transformed into an idea. Thought, as thought, therefore in its unmixed nature involves no limits; it is finite only when it keeps to limited categories, which it believes to be ultimate. Infinite or speculative thought, on the contrary, while it no less defines, does in the very act of limiting and defining make that defect vanish. And so infinity is

not, as most frequently happens, to be conceived as an abstract away and away for ever and ever, but in the simple manner previously indicated.

The thinking of the old metaphysical system was finite. Its whole mode of action was regulated by categories, the limits of which it believed to be permanently fixed and not subject to any further negation. Thus, one of its questions was: Has God existence? The question supposes that existence is an altogether positive term, a sort of *ne plus ultra*. We shall see however at a later point that existence is by no means a merely positive term, but one which is too low for the Absolute Idea, and unworthy of God. A second question in these metaphysical systems was: Is the world finite or infinite ? The very terms of the question assume that the finite is a permanent contradictory to the infinite: and one can easily see that, when they are so opposed, the infinite, which of course ought to be the whole, only appears as a single aspect and suffers restriction from the finite. But a restricted infinity is itself only a finite. In the same way it was asked whether the soul was simple or composite. Simpleness was, in other words, taken to be an ultimate characteristic, giving expression to a whole truth. Far from being so, simpleness is the expression of a half-truth, as one-sided and abstract as existence — a term of thought, which, as we shall hereafter see, is itself untrue and hence unable to hold truth. If the soul be viewed as merely and abstractly simple, it is characterised in an inadequate and finite way.

It was therefore the main question of the pre-Kantian metaphysic to discover whether predicates of the kind mentioned were to be ascribed to its objects. Now these predicates are after all only limited formulae of the understanding which, instead of expressing the truth, merely impose a limit. More than this, it should be noted that the chief feature of the method lay in 'assigning' or 'attributing' predicates to the object that was to be cognised, for example, to God. But attribution is no more than an external reflection about the object: the predicates by which the object is to be determined are

supplied from the resources of picture-thought, and are applied in a mechanical way. Whereas, if we are to have genuine cognition, the object must characterise its own self and not derive its predicates from without. Even supposing we follow the method of predicating, the mind cannot help feeling that predicates of this sort fail to exhaust the object. From the same point of view the Orientals are quite correct in calling God the many-named or the myriad-named One. One after another of these finite categories leaves the soul unsatisfied, and the Oriental sage is compelled unceasingly to seek for more and more of such predicates. In finite things it is no doubt the case that they have to be characterised through finite predicates: and with these things the understanding finds proper scope for its special action. Itself finite, it knows only the nature of the finite. Thus, when I call some action a theft, I have characterised the action in its essential facts; and such a knowledge is sufficient for the judge. Similarly, finite things stand to each other as cause and effect, force and exercise, and when they are apprehended in these categories, they are known in their finitude. But the objects of reason cannot be defined by these finite predicates. To try to do so was the defect of the old metaphysic.

§ 29

Predicates of this kind, taken individually, have but a limited range of meaning, and no one can fail to perceive how inadequate they are, and how far they fall below the fullness of detail which our imaginative thought gives, in the case, for example, of God, Mind, or Nature. Besides, though the fact of their being all predicates of one subject supplies them with a certain connection, their several meanings keep them apart: and consequently each is brought in as a stranger in relation to the others.

The first of these defects the Orientals sought to remedy, when, for example, they defined God by attributing to Him many names; but still they

felt that the number of names would have had to be infinite.

§ 30

(2) In the second place, *the metaphysical systems adopted a wrong criterion.* Their objects were no doubt totalities which in their own proper selves belong to reason that is, to the organised and systematically developed universe of thought. But these totalities — God, the Soul, the World — were taken by the metaphysician as subjects made and ready, to form the basis for an application of the categories of the understanding. They were assumed from popular conception. Accordingly popular conception was the only canon for settling whether or not the predicates were suitable and sufficient.

§ 31

The common conceptions of God, the Soul, the World, may be supposed to afford thought a firm and fast footing. They do not really do so. Besides having a particular and subjective character clinging to them, and thus leaving room for great variety of interpretation, they themselves first of all require a firm and fast definition by thought. This may be seen in any of these propositions where the predicate, or in philosophy the category, is needed to indicate what the subject, or the conception we start with, is.

In such a sentence as 'God is eternal', we begin with the conception of God, not knowing as yet what he is: to tell us that, is the business of the predicate. In the principles of logic, accordingly, where the terms formulating the subject-matter are those of thought only, it is not merely superfluous to make these categories predicates to propositions in which God, or, still vaguer, the Absolute, is the subject, but it would also have the disadvantage of suggesting another canon than the nature of thought. Besides, the propositional form (and for proposition, it would be more

correct to substitute judgment) is not suited to express the concrete — and the true is always concrete — or the speculative. Every judgment is by its form one-sided and, to that extent, false.

This metaphysic was not free or objective thinking. Instead of letting the object freely and spontaneously expound its own characteristics, metaphysic presupposed it ready-made. If anyone wishes to know what free thought means, he must go to Greek philosophy: for Scholasticism, like these metaphysical systems, accepted its facts, and accepted them as a dogma from the authority of the Church. We moderns, too, by our whole upbringing, have been initiated into ideas which it is extremely difficult to overstep, on account of their far-reaching significance. But the ancient philosophers were in a different position. They were men who lived wholly in the perceptions of the senses, and who, after their rejection of mythology and its fancies, presupposed nothing but the heaven above and the earth around. In these material, non-metaphysical surroundings, thought is free and enjoys its own privacy — cleared of everything material and thoroughly at home. This feeling that we are all our own is characteristic of free thought — of that voyage into the open, where nothing is below us or above us, and we stand in solitude with ourselves alone.

§ 32

(3) In the third place, *this system of metaphysic turned into Dogmatism*. When our thought never ranges beyond narrow and rigid terms, we are forced to assume that of two opposite assertions, such as were the above propositions, the one must be true and the other false.

Dogmatism may be most simply described as the contrary of Scepticism. The ancient Sceptics gave the name of Dogmatism to every philosophy whatever holding a system of definite doctrine. In this large sense Scepticism may apply the name even to philosophy which is properly

Speculative. But in the narrower sense, Dogmatism consists in the tenacity which draws a hard and fast line between certain terms and others opposite to them. We may see this clearly in the strict ‘either — or’: for instance, The world is either finite or infinite; but one of these two it must be. The contrary of this rigidity is the characteristic of all Speculative truth. There no such inadequate formulae are allowed, nor can they possibly exhaust it. These formulae Speculative truth holds in union as a totality, whereas Dogmatism invests them in their isolation with a title to fixity and truth.

It often happens in philosophy that the half-truth takes its place beside the whole truth and assumes on its own account the position of something permanent. But the fact is that the half-truth, instead of being a fixed or self-subsistent principle, is a mere element absolved and included in the whole. The metaphysic of understanding is dogmatic, because it maintains half-truths in their isolation: whereas the idealism of speculative philosophy carries out the principle of totality and shows that it can reach beyond the inadequate formularies of abstract thought. Thus idealism would say: The soul is neither finite only, nor infinite only; it is really the one just as much as the other, and in that way neither the one nor the other. In other words, such formularies in their isolation are inadmissible, and only come into account as formative elements in a larger notion. Such idealism we see even in the ordinary phases of consciousness. Thus we say of sensible things, that they are changeable: that is, they *are*, but it is equally true that they are not. We show more obstinacy in dealing with the categories of the understanding. These are terms which we believe to be somewhat firmer — or even absolutely firm and fast. We look upon them as separated from each other by an infinite chasm, so that opposite categories can never get at each other. The battle of reason is the struggle to break up the rigidity to which the understanding has reduced everything.

§ 33

The *first* part of this metaphysic in its systematic form is Ontology, or the doctrine of the abstract characteristics of Being. The multitude of these characteristics, and the limits set to their applicability, are not founded upon any principle. They have in consequence to be enumerated as experience and circumstances direct, and the import ascribed to them is founded only upon common sensualised conceptions, upon assertions that particular words are used in a particular sense, and even perhaps upon etymology. If experience pronounces the list to be complete, and if the usage of language, by its agreement, shows the analysis to be correct, the metaphysician is satisfied; and the intrinsic and independent truth and necessity of such characteristics is never made a matter of :investigation at all.

To ask if being, existence, finitude, simplicity, complexity, etc. are notions intrinsically and independently true, must surprise those who believe that a question about truth can only concern propositions (as to whether a notion is or is not with truth to be attributed, as the phrase is, to a subject), and that falsehood lies in the contradiction existing between the subject in our ideas, and the notion to be predicated of it. Now as the notion is concrete, it and every character of it in general is essentially a self-contained unity of distinct characteristics. If truth then were nothing more than the absence of contradiction, it would be first of all necessary in the case of every notion to examine whether it, taken individually, did not contain this sort of intrinsic contradiction.

§ 34

The *second* branch of the metaphysical system was Rational Psychology or Pneumatology. It dealt with the metaphysical nature of the soul — that is, of the Mind regarded as a thing. It expected to find immortality in a sphere dominated by the laws of composition, time, qualitative change, and quantitative increase or decrease.

The name ‘rational’, given to this species of psychology, served to contrast it with empirical modes of observing the phenomena of the soul Rational psychology viewed the soul in its metaphysical nature, and through the categories supplied by abstract thought. The rationalists endeavoured to ascertain the inner nature of the soul as it is in itself and as it is for thought. In philosophy at present we hear little of the soul: the favourite term is now mind (spirit). The two are distinct, soul being as it were the middle term between body and spirit, or the bond between the two. The mind, as soul, is immersed in corporeity, and the soul is the animating principle of the body.

The pre-Kantian metaphysic, we say, viewed the soul as a thing. ‘Thing’ is a very ambiguous word. By a thing, we mean, firstly, an immediate existence, something we represent in sensuous form: and in this meaning the term has been applied to the soul. Hence the question regarding the seat of the soul. Of course, if the soul have a seat, it is in space and sensuously envisaged. So, too, if the soul be viewed as a thing we can ask whether the soul is simple or composite. The question is important as bearing on the immortality of the soul, which is supposed to depend on the absence of composition. But the fact is, that in abstract simplicity we have a category, which as little corresponds to the nature of the soul, as that of compositeness.

One word on the relation of rational to empirical psychology. The former, because it sets itself to apply thought to cognise mind and even to demonstrate the result of such thinking, is the higher; whereas empirical psychology starts from perception, and only recounts and describes what perception supplies. But if we propose to think the mind, we must not be quite so shy of its special phenomena. Mind is essentially active in the same sense as the Schoolmen [Scholastics] said that God is ‘absolute actuosity’. But if the mind is active it must as it were utter itself. It is wrong therefore

to take the mind for a processless *ens*, as did the old metaphysic which divided the processless inward life of the mind from its outward life. The mind, of all things, must be looked at in its concrete actuality, in its energy; and in such a way that its manifestations are seen to be determined by its inward force.

§ 35

The *third* branch of metaphysics was Cosmology. The topics it embraced were the world, its contingency, necessity, eternity, limitation in time and space: the laws (only formal) of its changes: the freedom of man and the origin of evil.

To these topics it applied what were believed to be thoroughgoing contrasts: such as contingency and necessity; eternal and internal necessity; efficient and final cause, or causality in general and design; essence or substance and phenomenon; form and matter; freedom and necessity; happiness and pain; good and evil.

The object of Cosmology comprised not merely Nature, but Mind too, in its external complicating in its phenomenon — in fact, existence in general, or the sum of finite things. This object however it viewed not as a concrete whole, but only under certain abstract points of view. Thus the questions Cosmology attempted to solve were such as these: Is accident or necessity dominant in the world? Is the world eternal or created? It was therefore a chief concern of this study to lay down what were called general cosmological laws: for instance, that Nature does not act by fits and starts. And by fits and starts (*saltus*) they meant a qualitative difference or qualitative alteration showing itself without any antecedent determining mean: whereas, on the contrary, a gradual change (of quantity) is obviously not without intermediation.

In regard to Mind as it makes itself felt in the world, the questions which Cosmology chiefly discussed turned upon the freedom of man and the origin of evil. Nobody can deny that these are questions of the highest importance. But to give them a satisfactory answer, it is above all things necessary not to claim finality for the abstract formulae of understanding, or to suppose that each of the two terms in an antithesis has an independent subsistence or can be treated in its isolation as a complete and self-centred truth. This however is the general position taken by the metaphysicians before Kant, and appears in their cosmological discussions, which for that reason were incapable of compassing their purpose, to understand the phenomena of the world. Observe how they proceed with the distinction between freedom and necessity, in their application of these categories to Nature and Mind. Nature they regard as subject in its workings to necessity; Mind they hold to be free. No doubt there is a real foundation for this distinction in the very core of the Mind itself: but freedom and necessity, when thus abstractly opposed, are terms applicable only in the finite world to which, as such, they belong. A freedom involving no necessity, and mere necessity without freedom, are abstract and in this way untrue formulae of thought. Freedom is no blank indeterminateness: essentially concrete, and unvaryingly self-determinate, it is so far at the same time necessary. Necessity, again, in the ordinary acceptation of the term in popular philosophy, means determination from without only — as in finite mechanics, where a body moves only when it is struck by another body, and moves in the direction communicated to it by the impact. This however is a merely external necessity, not the real inward necessity which is identical with freedom.

The case is similar with the contrast of Good and Evil — the favourite contrast of the introspective modern world. If we regard Evil as possessing a fixity of its own, apart and distinct from Good, we are to a certain extent

right: there is an opposition between them; nor do those who maintain the apparent and relative character of the opposition mean that Evil and Good in the Absolute are one, or, in accordance with the modern phrase, that a thing first becomes evil from our way of looking at it. The error arises when we take Evil as a permanent positive, instead of — what it really is — a negative which, though it would fain assert itself, has no real persistence, and is, in fact, only the absolute sham-existence of negativity in itself.

§ 36

The *fourth* branch of metaphysics is Natural or Rational Theology. The notion of God, or God as a possible being, the proofs, of his existence, and his properties, formed the study of this branch.

(a) When understanding thus discusses the Deity, its main purpose is to find what predicates correspond or not to the fact we have in our imagination as God. And in doing it assumes the contrast between positive and negative to be absolute; and hence, in the long run, nothing is left for the notion as understanding takes it, but the empty abstraction of indeterminate Being, of mere reality or positivity, the lifeless product of modern ‘Deism’.

(b) The method of demonstration employed in finite knowledge must always lead to an inversion of the true order. For it requires the statement of some objective ground for God’s being, which thus acquires the appearance of being derived from something else. This mode of proof, guided as it is by the canon of mere analytical identity, is embarrassed by the difficulty of passing from the finite to the infinite. Either the finitude of the existing world, which is left as much a fact as it was before, clings to the notion of Deity, and God has to be defined as the immediate substance of that world — which is Pantheism: or he remains an object set over against the subject, and in this way, finite — which is Dualism.

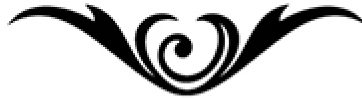
(c) The attributes of God which ought to be various and precise had, properly speaking, sunk and disappeared in the abstract notion of pure reality, of indeterminate Being. Yet in our material thought, the finite world continues, meanwhile, to have a real being, with God as a sort of antithesis: and thus arises the further picture of different relations of God to the world. These, formulated as properties, must, on the one hand, as relations to finite circumstances, themselves possess a finite character (giving us such properties as just, gracious, mighty, wise, etc.); on the other hand they must be infinite. Now on this level of thought the only means, and a hazy one, of reconciling these opposing requirements was quantitative exaltation of the properties, forming them into indeterminateness — into *the sensus eminentior*. But it was an expedient which really destroyed the property and left a mere name.

The object of the old metaphysical theology was to see how far unassisted reason could go in the knowledge of God. Certainly a reason derived knowledge of God is the highest problem of philosophy. The earliest teachings of religion are figurate conceptions of God. These conceptions, as the Creed arranges them, are imparted to us in youth. They are the doctrines of our religion, and in so far as the individual rests his faith on these doctrines and feels them to be the truth, he has all he needs as a Christian. Such is faith: and the science of this faith is Theology. But until Theology is something more than a bare enumeration and compilation of these doctrines *ab extra,* it has no right to the title of science. Even the method so much in vogue at present — the purely historical mode of treatment — which for example reports what has been said by this or the other Father of the Church — does not invest theology with a scientific character. To get that, we must go on to comprehend the facts by thought — which is the business of philosophy. Genuine theology is thus at the same

time a real philosophy of religion, as it was, we may add, in the Middle Ages.

And now let us examine this rational theology more narrowly. It was a science which approached God not by reason but by understanding, and, in its mode of thought, employed the terms without any sense of their mutual limitations and connections. The notion of God formed the subject of discussion; and yet the criterion of our knowledge was derived from such an extraneous source as the materialised conception of God. Now thought must be free in its movements. It is no doubt to be remembered that the result of independent thought harmonises with the import of the Christian religion: for the Christian religion is a revelation of reason. But such a harmony surpassed the efforts of rational theology. It proposed to define the figurate conception of God in terms of thought; but it resulted in a notion of God which was what we may call the abstract of positivity or reality, to the exclusion of all negation. God was accordingly defined to be the most real of all beings. Anyone can see however that this most real of beings, in which negation forms no part, is the very opposite of what it ought to be and of what understanding supposes it to be. Instead of being rich and full above all measure, it is so narrowly conceived that it is, on the contrary, extremely poor and altogether empty. It is with reason that the heart craves a concrete body of truth; but without definite feature, that is, without negation, contained in the notion, there can only be an abstraction. When the notion of God is apprehended only as that of the abstract or most real being, God is, as it were, relegated to another world beyond: and to speak of a knowledge of him would be meaningless. Where there is no definite quality, knowledge is impossible. Mere light is mere darkness.

The second problem of rational theology was to prove the existence of God. Now, in this matter, the main point to be noted is that demonstration, as the understanding employs it, means the dependence of one truth on



another. In such proofs we have a presupposition-something firm and fast, from which something else follows; we exhibit the dependence of some truth from an assumed starting-point. Hence, if this mode of demonstration is applied to the existence of God, it can only mean that the being of God is to depend on other terms, which will then constitute the ground of his being. It is at once evident that this will lead to some mistake: for God must be simply and solely the ground of everything, and in so far not dependent upon anything else. And a perception of this danger has in modern times led some to say that God's existence is not capable of proof, but must be immediately or intuitively apprehended. Reason, however, and even sound common sense give demonstration a meaning quite different from that of the understanding. The demonstration of reason no doubt starts from something which is not God. But, as it advances, it does not leave the starting-point a mere unexplained fact, which is what it was. On the contrary it exhibits that point as derivative and called into being, and then God is seen to be primary, truly immediate, and self-subsisting, with the means of derivation wrapped up and absorbed in himself. Those who say: 'Consider Nature, and Nature will lead you to God; you will find an absolute final cause' do not mean that God is something derivative: they mean that it is we who proceed to God himself from another; and in this way God, though the consequence, is also the absolute ground of the initial step. The relation of the two things is reversed; and what came as a consequence being shown to be an antecedent, the original antecedent is reduced to a consequence. This is always the way, moreover, whenever reason demonstrates.

If in the light of the present discussion we cast one glance more on the metaphysical method as a whole, we find its main characteristic was to make abstract identity its principle and to try to apprehend the objects of reason by the abstract and finite categories of the understanding. But this

infinite of the understanding, this pure essence, is still finite: it has excluded all the variety of particular things, which thus limit and deny it. Instead of winning a concrete, this metaphysic stuck fast on an abstract, identity. Its good point was the perception that thought alone constitutes the essence of all that is. It derived its materials from earlier philosophers, particularly the Schoolmen. In speculative philosophy the understanding undoubtedly forms a stage, but not a stage at which we should keep for ever standing. Plato is no metaphysician of this imperfect type, still less Aristotle, although the contrary is generally believed.

IV. Second Attitude of Thought to Objectivity

ONE. EMPIRICISM

§ 37

Under these circumstances a double want began to be felt. Partly it was the need of a concrete subject-matter, as a counterpoise to the abstract theories of the understanding, which is unable to advance unaided from its generalities to specialisation and determination. Partly, too, it was the demand for something fixed and secure, so as to exclude the possibility of proving anything and everything in the sphere, and according to the method of the finite formulae of thought. Such was the genesis of Empirical philosophy, which abandons the search for truth in thought itself, and goes to fetch it from Experience, the outward and the inward present.

The rise of Empiricism is due to the need thus stated of concrete contents, and a firm footing — needs which the abstract metaphysic of the understanding failed to satisfy. Now by concreteness of contents it is meant that we must know the objects of consciousness as intrinsically determinate and as the unity of distinct characteristics. But, as we have already seen, this is by no means the case with the metaphysic of understanding, if it conform to its principle. With the mere understanding, thinking is limited to the form of an abstract universal, and can never advance to the particularisation of this universal. Thus we find the metaphysicians engaged in an attempt to elicit by the instrumentality of thought what was the essence or fundamental attribute of the Soul. The Soul, they said, is simple. The simplicity thus ascribed to the Soul meant a mere and utter simplicity, from which

difference is excluded: difference, or in other words composition, being made the fundamental attribute of body, or of matter in general. Clearly, in simplicity of this narrow type we have a very shallow category, quite incapable of embracing the wealth of the soul or of the mind. When it thus appeared that abstract metaphysical thinking was inadequate, it was felt that resource must be had to empirical psychology. The same happened in the case of Rational Physics. The current phrases there were, for instance, that space is infinite, that Nature makes no leap, etc. Evidently this phraseology was wholly unsatisfactory in presence of the plenitude and life of nature.

§ 38

To some extent this source from which Empiricism draws is common to it with metaphysic. It is in our materialised conceptions, i.e. in facts which emanate, in the first instance, from experience, that metaphysic also finds the guarantee for the correctness of its definitions (including both its initial assumptions and its more detailed body of doctrine). But, on the other hand, it must be noted that the single sensation is not the same thing as experience, and that the Empirical School elevates the facts included under sensation, feeling, and perception into the form of general ideas propositions, or laws. This, however, it does with the reservation that these general principles (such as force) are to have no further import or validity of their own beyond that taken from the sense impression, and that no connection shall be deemed legitimate except what can be shown to exist in phenomena. And on the subjective side Empirical cognition has its stable footing in the fact that in a sensation consciousness is directly present and certain of itself.

In Empiricism lies the great principle that whatever is true must be in the actual world and present to sensation. This principle contradicts that ‘ought to be’ on the strength of which ‘reflection’ is vain enough to treat the actual

present with scorn and to point to a scene beyond a scene which is assumed to have place and being only in the understanding of those who talk of it. No less than Empiricism, philosophy (§ 7) recognises only what is, and has nothing to do with what merely ought to be and what is thus confessed not to exist. On the subjective side, too, it is right to notice the valuable principle of freedom involved in Empiricism. For the main lesson of Empiricism is that man must see for himself and feel that he is present in every fact of knowledge which he has to accept.

When it is carried out to its legitimate consequences, Empiricism being in its facts limited to the finite sphere denies the supersensible in general, or at least any knowledge of it which would define its nature; it leaves thought no powers except abstraction and formal universality and identity. But there is a fundamental delusion in all scientific empiricism. It employs the metaphysical categories of matter, force, those of one, many, generality, infinity, etc.; following the clue given by these categories it proceeds to draw conclusions, and in so doing presupposes and applies the syllogistic form. And all the while it is unaware that it contains metaphysics in wielding which, it makes use of those categories and their combinations in a style utterly thoughtless and uncritical.

From Empiricism came the cry: ‘Stop roaming in empty abstractions keep your eyes open, lay hold on man and nature as they are here before you, enjoy the present moment.’ Nobody can deny that there is a good deal of truth in these words. The everyday world, what is here and now was a good exchange for the futile other-world — for the mirages and the chimeras of the abstract understanding. And thus was acquired an infinite principle — that solid footing so much missed in the old metaphysic. Finite principles are the most that the understanding can pick out — and these being essentially unstable and tottering, the structure they supported must collapse with a crash. Always the instinct of reason was to find an infinite

principle. As yet, the time had not come for finding it in thought. Hence, this instinct seized upon the present, the Here, the This — where doubtless there is implicit infinite form, but not in the genuine existence of that form. The external world is the truth, it if could but know it: for the truth is actual and must exist. The infinite principle, the self-centred truth, therefore, is in the world for reason to discover: though it exists in an individual and sensible shape, and not in its truth.

Besides, this school makes sense-perception the form in which fact is to be apprehended; and in this consists the defect of Empiricism. Sense perception as such is always individual, always transient: not indeed that the process of knowledge stops short at sensation: on the contrary, it proceeds to find out the universal and permanent element in the individual apprehended by sense. This is the process leading from simple perception to experience.

In order to form experiences, Empiricism makes especial use of the form of Analysis. In the impression of sense we have a concrete of many elements, the several attributes of which we are expected to peel off one by one, like the skins of an onion. In thus dismembering the thing, it is understood that we disintegrate and take to pieces these attributes which have coalesced, and add nothing but our own act of disintegration. Yet analysis is the process from the immediacy of sensation to thought: those attributes, which the object analysed contains in union, acquire the form of universality by being separated. Empiricism therefore labours under a delusion, if it supposes that, while analysing the objects, it leaves them as they were: it really transforms the concrete into an abstract. And as a consequence of this change, the living thing is killed: life can exist only in the concrete and one. Not that we can do without this division, if it be our intention to comprehend. Mind itself is an inherent division. The error lies in forgetting that this is only one half of the process, and that the main point

is the reunion of what has been parted. And it is where analysis never gets beyond the stage of partition that the words of the poet are true:

Encheiresin Naturae nennt's die Chemie,
Spottet ihrer selbat, und weiss nicht, wie:
hat die Theile in ihrer Hand,
Fehlt leider nur das geistige Band.

Analysis starts from the concrete; and the possession of this material gives it a considerable advantage over the abstract thinking of the old metaphysics. It establishes the differences in things, and this is very important; but these very differences are nothing after all but abstract attributes, i.e. thoughts. These thoughts, it is assumed, contain the real essence of the objects; and thus once more we see the axiom of bygone metaphysics reappear, that the truth of things lies in thought.

Let us next compare the empirical theory with that of metaphysics in the matter of their respective contents. We find the latter, as already stated, taking for its theme the universal objects of the reason, viz. God, the Soul, and the World: and these themes, accepted from popular conception, it was the problem of philosophy to reduce into the form of thoughts. Another specimen of the same method was the Scholastic philosophy, the theme presupposed by which was formed by the dogmas of the Christian Church; and it aimed at fixing their meaning and giving them a systematic arrangement through thought. The facts on which Empiricism is based are of entirely different kind. They are the sensible facts of nature and the facts of the finite mind. In other words, Empiricism deals with a finite material, and the old metaphysicians had an infinite — though, let us add, they made this infinite content finite by the finite form of the understanding. The same finitude of form reappears in Empiricism — but here the facts are finite also. To this extent, then, both modes of philosophising have the same

method; both proceed from data or assumptions, which they accept as ultimate.

Generally speaking, Empiricism finds the truth in the outward world, and even if it allow a supersensible world, it holds knowledge of that world to be impossible, and would restrict us to the province of sense-perception. This doctrine when systematically carried out produces what has been latterly termed Materialism. Materialism of this stamp looks upon matter, qua matter, as the genuine objective world. But with matter we are at once introduced to an abstraction, which as such cannot be perceived, and it may be maintained that there is no matter, because, as it exists, it is always something definite and concrete. Yet the abstraction we term matter is supposed to lie at the basis of the whole world of sense, and expresses the sense-world in its simplest terms as out-and-out individualisation, and hence a congeries of points in mutual exclusion. So long then as this sensible sphere is and continues to be for Empiricism a mere datum, we have a doctrine of bondage: for we become free, when we are confronted by no absolutely alien world, but depend upon a fact which we ourselves are. Consistently with the empirical point of view, besides, reason and unreason can only be subjective: in other words, we must take what is given just as it is, and we have no right to ask whether and to what extent it is rational in its own nature.

§ 39

Touching this principle it has been justly observed that in what we call Experience, as distinct from mere single perception of single facts, there are two elements. The one is the matter, infinite in its multiplicity, and as it stands a mere set of singulars: the other is the form, the characteristics of universality and necessity. Mere experience no doubt offers many, perhaps innumerable, cases of similar perceptions: but, after all, no multitude,

however great, can be the same thing as universality. Similarly, mere experience affords perceptions of changes succeeding each other and of objects in juxtaposition; but it presents no necessary connection. If perception, therefore, is to maintain its claim to be the sole basis of what men hold for truth, universality and necessity appear something illegitimate: they become an accident of our minds, a mere custom, the content of which might be otherwise constituted than it is.

It is an important corollary of this theory, that on this empirical mode of treatment legal and ethical principles and laws, as well as the truths of religion, are exhibited as the work of chance, and stripped of their objective character and inner truth.

The scepticism of Hume, to which this conclusion was chiefly due, should be clearly marked off from Greek scepticism. Hume assumes the truth of the empirical element, feeling and sensation, and proceeds to challenge universal principles and laws, because they have no warranty from sense-perception. So far was ancient scepticism from making feeling and sensation the canon of truth, that it turned against the deliverances of sense first of all.

IV. Second Attitude of Thought to Objectivity TWO. THE CRITICAL PHILOSOPHY

§ 40

In common with Empiricism, the Critical Philosophy assumes that experience affords the one sole foundation for cognitions; which however it does not allow to rank as truths, but only as knowledge of phenomena.

The Critical theory starts originally from the distinction of elements presented in the analysis of experience, viz. the matter of sense, and its universal relations. Taking into account Hume’s criticism on this distinction

as given in the preceding section, viz. that sensation does not explicitly apprehend more than an individual or more than a mere event, it insists at the same time on the fact that universality and necessity are seen to perform a function equally essential in constituting what is called experience. This element, not being derived from the empirical facts as such, must belong to the spontaneity of thought; in other words, it is *a priori*. The Categories or Notions of the Understanding constitute the *objectivity* of experiential cognitions. In every case they involve a connective reference, and hence through their means are formed synthetic judgments *a priori*, that is, primary and underivative connections of opposites.

Even Hume's scepticism does not deny that the characteristics of universality and necessity are found in cognition. And even in Kant this fact remains a presupposition after all; it may be said, to use the ordinary phraseology of the sciences, that Kant did no more than offer another *explanation* of the fact.

§ 41

The Critical Philosophy proceeds to test the value of the categories employed in metaphysic, as well as in other sciences and in ordinary conception. This scrutiny however is not directed to the content of these categories, nor does it inquire into the exact relation they bear to one another: but simply considers them as affected by the contrast between subjective and objective. The contrast, as we are to understand it here, bears upon the distinction (see preceding §) of the two elements in experience. The name of objectivity is here given to the element of universality and necessity, i.e. to the categories themselves, or what is called the *a priori* constituent. The Critical Philosophy however widened the contrast in such a way, that the subjectivity comes to embrace the *ensemble* of experience,

including both of the aforesaid elements; and nothing remains on the other side but the 'thing-in-itself'.

The special forms of the *a priori* element, in other words, of thought, which in spite of its objectivity is looked upon as a purely subjective act, present themselves as follows in a systematic order which, it may be remarked, is solely based upon psychological and historical grounds.

(1) A very important step was undoubtedly made, when the terms of the old metaphysic were subjected to scrutiny. The plain thinker pursued his unsuspecting way in those categories which had offered themselves naturally. It never occurred to him to ask to what extent these categories had a value and authority of their own. If, as has been said, it is characteristic of free thought to allow no assumptions to pass unquestioned, the old metaphysicians were not free thinkers. They accepted their categories as they were, without further trouble, as an *a priori* datum, not yet tested by reflection. The Critical philosophy reversed this. Kant undertook to examine how far the forms of thought were capable of leading to the knowledge of truth. In particular he demanded a criticism of the faculty of cognition as preliminary to its exercise. That is a fair demand, if it mean that even the forms of thought must be made an object of investigation. Unfortunately there soon creeps in the misconception of already knowing before you know — the error of *refusing to enter the water until you have learnt to swim*. True, indeed, the forms of thought should be subjected to a scrutiny before they are used: yet what is this scrutiny but *ipso facto* a cognition?

So that what we want is to combine in our process of inquiry the action of the forms of thought with a criticism of them. The forms of thought must be studied in their essential nature and complete development: they are at once the object of research and the action of that object. Hence they examine themselves: in their own action they must determine their limits,

and point out their defects. This is that action of thought, which will hereafter be specially considered under the name of Dialectic, and regarding which we need only at the outset observe that, instead of being brought to bear upon the categories from without, it is Immanent in their own action.

We may therefore state the first point in Kant's philosophy as follows: Thought must itself investigate its own capacity of knowledge. People in the present day have got over Kant and his philosophy: everybody wants to get further. But there are two ways of going further — a backward and a forward. The light of criticism soon shows that many of our modern essays in philosophy are mere repetitions of the old metaphysical method, an endless and uncritical thinking in a groove determined by the natural bent of each man's mind.

(2) Kant's examination of the categories suffers from the grave defect of viewing them, not absolutely and for their own sake, but in order to see whether they are subjective or objective. In the language of common life we mean by objective what exists outside of us and reaches us from without by means of sensation. What Kant did was to deny that the categories, such as cause and effect, were, in this sense of the word, objective, or given in sensation, and to maintain on the contrary that they belonged to our own thought itself, to the spontaneity of thought. To that extent therefore they were subjective. And yet in spite of this, Kant gives the name objective to what is thought, to the universal and necessary, while he describes as subjective whatever is merely felt. This arrangement apparently reverses the first-mentioned use of the word, and has caused Kant to be charged with confusing language. But the charge is unfair if we more narrowly consider the facts of the case. The vulgar believe that the objects of perception which confront them, such as an individual animal, or a single star, are independent and permanent existences, compared with which thoughts are unsubstantial and dependent on something else. In fact however the

perceptions of sense are the properly dependent and secondary feature, while the thoughts are really independent and primary. This being so, Kant gave the title objective to the intellectual factor, to the universal and necessary: and he was quite justified in so doing. Our sensations on the other hand are subjective; for sensations lack stability in their own nature, and are no less fleeting and evanescent than thought is permanent and self-subsisting. At the present day, the special line of distinction established by Kant between the subjective and objective is adopted by the phraseology of the educated world. Thus the criticism of a work of art ought, it is said, to be not subjective, but objective — in other words, instead of springing from the particular and accidental feeling or temper of the moment, it should keep its eye on those general points of view which the laws of art establish. In the same acceptation we can distinguish in any scientific pursuit the objective and the subjective interest of the investigation.

But after all, objectivity of thought, in Kant's sense, is again to a certain extent subjective. Thoughts, according to Kant, although universal and necessary categories, are *only our* thoughts — separated by an impassable gulf from the thing, as it exists apart from our knowledge. But the true objectivity of thinking means that the thoughts, far from being merely ours, must at the same time be the real essence of the things, and of whatever is an object to us.

Objective and subjective are convenient expressions in current use, the employment of which may easily lead to confusion. Up to this point, the discussion has shown three meanings of objectivity. First, it means what has external existence, in distinction from which the subjective is what is only supposed, dreamed, &c. Secondly, it has the meaning, attached to it by Kant, of the universal and necessary, as distinguished from the particular, subjective, and occasional element which belongs to our sensations. Thirdly, as has been just explained, it means the thought-apprehended

essence of the existing thing, in contradistinction from what is merely our thought, and what consequently is still separated from the thing itself, as it exists in independent essence.

§ 42

(a) The Theoretical Faculty. Cognition *qua* cognition. The specific ground of the categories is declared by the Critical system to lie in the primary identity of the 'I' in thought what Kant calls the 'transcendental unity of self-consciousness'. The impressions from feeling and perception are, if we look to their contents, a multiplicity or miscellany of elements: and the multiplicity is equally conspicuous in their form. For sense is marked by a mutual exclusion of members; and that under two aspects, namely space and time, which, being the forms, that is to say, the universal type of perception, are themselves *a priori*. This congeries, afforded by sensation and perception, must however be reduced to an identity or primary synthesis. To accomplish this the 'I' brings it in relation to itself and unites it there in *one* consciousness which Kant calls 'pure apperception'. The specific modes in which the Ego refers to itself the multiplicity of sense are the pure concepts of the understanding, the Categories.

Kant, it is well known, did not put himself to much trouble in discovering the categories. 'I', the unity of selfconsciousness, being quite abstract and completely indeterminate, the question arises, how are we to get at the specialised forms of the 'I', the categories? Fortunately, the common logic offers to our hand an empirical classification of the kinds of *judgment*. Now, to judge is the same as to *think* of a determinate object. Hence the various modes of judgment, as enumerated to our hand, provide us with the several categories of thought. To the philosophy of Fichte belongs the great merit of having called attention to the need of exhibiting

the *necessity* of these categories and giving a genuine *deduction* of them. Fichte ought to have produced at least one effect on the method of logic. One might have expected that the general laws of thought, the usual stock-in-trade of logicians, or the classification of notions, judgments, and syllogisms, would be no longer taken merely from observation and so only empirically treated, but be deduced from thought itself. If thought is to be capable of proving anything at all, if logic must insist upon the necessity of proofs, and if it proposes to teach the theory of demonstration, its first care should be to give a reason for its own subject.

(1) Kant therefore holds that the categories have their source in the 'Ego' and that the 'Ego' consequently supplies the characteristics of universality and necessity. If we observe what we have before us primarily, we may describe it as a congeries or diversity: and in the categories we find the simple points or units, to which this congeries is made to converge. The world of sense is a scene of mutual exclusion: its being is outside itself. That is the fundamental feature of the sensible. 'Now' has no meaning except in reference to a before and a hereafter. Red, in the same way, only subsists by being opposed to yellow and blue. Now this other thing is outside the sensible; which latter is, only in so far as it is not the other, and only in so far as that other is. But thought, or the 'Ego', occupies a position the very reverse of the sensible, with its mutual exclusions, and its being outside itself. The 'I' is the primary identity — at one with itself and all at home in itself. The word 'I' expresses the mere act of bringing-to-bear-upon-self: and whatever is placed in this unit or focus is affected by it and transformed into it. The 'I' is as it were the crucible and the fire which consumes the loose plurality of sense and reduces it to unity. This is the process which Kant calls pure apperception in distinction from the common apperception, to which the plurality it receives is a plurality still; whereas

pure apperception is rather an act by which the ‘I’ makes the materials ‘mine’.

This view has at least the merit of giving a correct expression to the nature of all consciousness. The tendency of all man’s endeavours is to understand the world, to appropriate and subdue it to himself: and to this end the positive reality of the world must be as it were crushed and pounded, in other words, idealised. At the same time we must note that it is not the mere act of *our* personal self-consciousness which introduces an absolute unity into the variety of sense. Rather, this identity is itself the absolute. The absolute is, as it were, so kind as to leave individual things to their own enjoyment, and it again drives them back to the absolute unity.

(2) Expressions like ‘transcendental unity of self-consciousness’ have an ugly look about them, and suggest a monster in the background: but their meaning is not so abstruse as it looks. Kant’s meaning of transcendental may be gathered by the way he distinguishes it from transcendent. The transcendent may be said to be what steps out beyond the categories of the understanding: a sense in which the term is first employed in mathematics. Thus in geometry you are told to conceive the circumference of a circle as formed of an infinite number of infinitely small straight lines. In other words, characteristics which the understanding holds to be totally different, the straight line and the curve, are expressly invested with identity. Another transcendent of the same kind is the self-consciousness which is identical with itself and infinite in itself, as distinguished from the ordinary consciousness which derives its form and tone from finite materials. That unity of self-consciousness, however, Kant called *transcendental* only; and he meant thereby that the unity was only in our minds and did not attach to the objects apart from our knowledge of them.

(3) To regard the categories as subjective only, i.e. as a part of ourselves, must seem very odd to the natural mind; and no doubt there is something

queer about it. It is quite true however that the categories are not contained in the sensation as it is given us. When, for instance, we look at a piece of sugar, we find it is hard, white, sweet, etc. All these properties we say are united in one object. Now it is this unity that is not found in the sensation. The same thing happens if we conceive two events to stand in the relation of cause and effect. The senses only inform us of the two several occurrences which follow each other in time. But that the one is cause, the other effect — in other words, the causal nexus between the two — is not perceived by sense; it is only evident to thought. Still, though the categories, such as unity, or cause and effect, are strictly the property of thought, it by no means follows that they must be ours merely and not also characteristics of the objects. Kant however confines them to the subject-mind, and his philosophy may be styled subjective idealism: for he holds that both the form and the matter of knowledge are supplied by the Ego — or knowing subject — the form by our intellectual, the matter by our sentient ego.

So far as regards the content of this subjective idealism, not a word need be wasted. It might perhaps at first sight be imagined, that objects would lose their reality when their unity was transferred to the subject. But neither we nor the objects would have anything to gain by the mere fact that they possessed being.

The main point is not, *that* they are, but *what* they are, and whether or not their content is true. It does no good to the things to say merely that they have being. What has being, will also cease to be when time creeps over it. It might also be alleged that subjective idealism tended to promote self-conceit. But surely if a man's world be the sum of his sensible perceptions, he has no reason to be vain of such a world. Laying aside therefore as unimportant this distinction between subjective and objective, we are chiefly interested in knowing what a thing is: i.e. its content, which is no

more objective than it is subjective. If mere existence be enough to make objectivity, even a crime is objective: but it is an existence which is nullity at the core, as is definitely made apparent when the day of punishment comes.

§ 43

The Categories may be viewed in two aspects. On the one hand it is by their instrumentality that the mere perception of sense rises to objectivity and experience. On the other hand these notions are unities in our consciousness merely: they are consequently conditioned by the material given to them, and having nothing of their own they can be applied to use only within the range of experience. But the other constituent of experience, the impressions of feeling and perception, is not one whit less subjective than the categories.

To assert that the categories taken by themselves are empty can scarcely be right, seeing that they have a content, at all events, in the special stamp and significance which they possess. Of course the content of the categories is not perceptible to the senses, nor is it in time and space: but that is rather a merit than a defect. A glimpse of this meaning of content may be observed to affect our ordinary thinking. A book or a speech for example is said to have a great deal in it, to be full of content in proportion to the greater number of thoughts and general results to be found in it: while, on the contrary, we should never say that any book, e.g. a novel, had much in it, because it included a great number of single incidents, situations, and the like. Even the popular voice thus recognises that something more than the facts of sense is needed to make a work pregnant with matter. And what is this additional desideratum but thoughts, or in the first instance the categories? And yet it is not altogether wrong, it should be added, to call the categories of themselves empty, if it be meant that they and the logical Idea,

of which they are the members, do not constitute the whole of philosophy, but necessarily lead onwards in due progress to the real departments of Nature and Mind. Only let the progress not be misunderstood. The logical Idea does not thereby come into possession of a content originally foreign to it: but by its own native action is specialised and developed to Nature and Mind.

§ 44

It follows that the categories are no fit terms to express the Absolute – the Absolute not being given in perception – and Understanding, or knowledge by means of the categories, is consequently incapable of knowing the Things-in-themselves.

The Thing-in-itself (and under ‘thing’ is embraced even Mind and God) expresses the object when we leave out of sight all that consciousness makes of it, all its emotional aspects, and all specific thoughts of it. It is easy to see what is left utter abstraction, total emptiness, only described still as an ‘other-world’ the negative of every image, feeling, and definite thought. Nor does it require much penetration to see that this *caput mortuum* is still only a product of thought, such as accrues when thought is carried on to abstraction unalloyed: that it is the work of the empty ‘Ego’, which makes an *object* out of this empty self-identity of its own. The *negative* characteristic which this abstract identity receives as an object is also enumerated among the categories of Kant, and is no less familiar than the empty identity aforesaid. Hence one can only read with surprise the perpetual remark that we do not know the Thing-in-itself. On the contrary there is nothing we can know so easily.

§ 45

It is Reason, the faculty of the Unconditioned, which discovers the conditioned nature of the knowledge comprised in experience. What is thus called the object of Reason, the Infinite or Unconditioned, is nothing but self-sameness, or the primary identity of the ‘Ego’ in thought (mentioned in § 42). Reason itself is the name given to the abstract ‘Ego’ or thought, which makes this pure identity its aim or object (cf. note to the preceding §). Now this identity, having no definite attribute at all, can receive no illumination from the truths of experience, for the reason that these refer always to definite facts. Such is the sort of Unconditioned that is supposed to be the absolute truth of Reason what is termed the *Idea*; while the cognitions of experience are reduced to the level of untruth and declared to be appearances.

Kant was the first definitely to signalise the distinction between Reason and Understanding. The object of the former, as he applied the term, was the infinite and unconditioned, of the latter the finite and conditioned. Kant did valuable service when he enforced the finite character of the cognitions of the understanding founded merely upon experience, and stamped their contents with the name of appearance. But his mistake was to stop at the purely negative point of view, and to limit the unconditionality of Reason to an abstract self-sameness without any shade of distinction. It degrades Reason to a finite and conditioned thing, to identify it with a mere stepping beyond the finite and conditioned range of understanding. The real infinite, far from being a mere transcendence of the finite, always involves the absorption of the finite into its own fuller nature. In the same way Kant restored the Idea to its proper dignity: vindicating it for Reason, as a thing distinct from abstract analytic determinations or from the merely sensible conceptions which usually appropriate to themselves the name of ideas. But as respects the Idea also, he never got beyond its negative aspect, as what ought to be but is not.

The view that the objects of immediate consciousness, which constitute the body of experience, are mere appearances (phenomena) was another important result of the Kantian philosophy. Common Sense, that mixture of sense and understanding, believes the objects of which it has knowledge to be severally independent and self-supporting; and when it becomes evident that they tend towards and limit one another, the interdependence of one upon another is reckoned something foreign to them and to their true nature. The very opposite is the truth. The things immediately known are mere appearances — in other words, the ground of their being is not in themselves but in something else. But then comes the important step of defining what this something else is. According to Kant, the things that we know about are *to us* appearances only, and we can never know their essential nature, which belongs to another world we cannot approach.

Plain minds have not unreasonably taken exception to this subjective idealism, with its reduction of the facts of consciousness to a purely personal world, created by ourselves alone. For the true statement of the case is rather as follows. The things of which we have direct consciousness are mere phenomena, not for us only, but in their own nature; and the true and proper case of these things, finite as they are, is to have their existence founded not in themselves but in the universal divine Idea. This view of things, it is true, is as idealist as Kant's; but in contradistinction to the subjective idealism of the Critical philosophy should be termed absolute idealism. Absolute idealism, however, though it is far in advance of vulgar realism, is by no means merely restricted to philosophy. It lies at the root of all religion; for religion too believes the actual world we see, the sum total of existence, to be created and governed by God.

§ 46

But it is not enough simply to indicate the existence of the object of Reason. Curiosity impels us to seek for knowledge of this identity, this empty thing-in-itself. Now knowledge means such an acquaintance with the object as apprehends its distinct and special subject-matter. But such subject-matter involves a complex interconnection in the object itself, and supplies a ground of connection with many other objects. In the present case, to express the nature of the features of the Infinite or Thing-in-itself, Reason would have nothing except the categories: and in any endeavour so to employ them Reason becomes over-soaring or 'transcendent'.

Here begins the second stage of the Criticism of Reason – which, as an independent piece of work, is more valuable than the first. The first part, as has been explained above, teaches that the categories originate in the unity of self-consciousness; that any knowledge which is gained by their means has nothing objective in it, and that the very objectivity claimed for them is only subjective. So far as this goes, the Kantian Criticism presents that 'common' type of idealism known as Subjective Idealism. It asks no questions about the meaning or scope of the categories, but simply considers the abstract form of subjectivity and objectivity, and that even in such a partial way that the former aspect, that of subjectivity, is retained as a final and purely affirmative term of thought. In the second part, however, when Kant examines the *application*, as it is called, which Reason makes of the categories in order to know its objects, the content of the categories, at least in some points of view, comes in for discussion: or, at any rate, an opportunity presented itself for a discussion of the question. It is worth while to see what decision Kant arrives at on the subject of metaphysic, as this application of the categories to the unconditioned is called. His method of procedure we shall here briefly state and criticise.

§ 47

[a] The first of the unconditioned entities which Kant examines is the Soul (see above, § 34). 'In my consciousness', he says, 'I always find that I (1) am the determining subject; (2) am singular or abstractly simple; (3) am identical, or one and the same, in all the variety of what I am conscious of; (4) distinguish myself as thinking from all the things outside me.'

Now the method of the old metaphysic, as Kant correctly states it, consisted in substituting for these statements of experience the corresponding categories or metaphysical terms. Thus arise these four new propositions: (a) the Soul is a substance; (b) it is a simple substance; (c) it is numerically identical at the various periods of existence; (d) it stands in relation to space.

Kant discusses this translation, and draws attention to the Paralogism or mistake of confounding one kind of truth with another. He points out that empirical attributes have here been replaced by categories; and shows that we are not entitled to argue from the former to the latter, or to put the latter in place of the former.

This criticism obviously but repeats the observation of Hume (§ 39) that the categories as a whole – ideas of universality and necessity – are entirely absent from sensation; and that the empirical fact both in form and contents differs from its intellectual formulation.

If the purely empirical fact were held to constitute the credentials of the thought, then no doubt it would be indispensable to be able precisely to identify the 'idea' in the 'impression'.

And in order to make out, in his criticism of the metaphysical psychology, that the soul cannot be described as substantial, simple, self-same, and as maintaining its independence in intercourse with the material world, Kant argues from the single ground that the several attributes of the soul, which consciousness lets us feel in *experience*, are not exactly the same attributes as result from the action of *thought* thereon. But we have

seen above that according to Kant all knowledge, even experience, consists in thinking our impressions – in other words, in transforming into intellectual categories the attributes primarily belonging to sensation.

Unquestionably one good result of the Kantian criticism was that it emancipated mental philosophy from the 'soul-thing', from the categories, and, consequently, from questions about the simplicity, complexity, materiality, etc., of the soul. But even for the common sense of ordinary men, the true point of view, from which the inadmissibility of these forms best appears, will be not that they are thoughts, but that thoughts of such a stamp neither can nor do retain truth.

If thought and phenomenon do not perfectly correspond to one another, we are free at least to choose which of the two shall be held the defaulter. The Kantian idealism, where it touches on the world of Reason, throws the blame on the thoughts; saying that the thoughts are defective, as not being exactly fitted to the sensations and to a mode of mind wholly restricted within the range of sensation, in which as such there are no traces of the presence of these thoughts. But as to the actual content of the thought, no question is raised.

§ 47n

Paralogisms are a species of unsound syllogism, the especial vice of which consists in employing one and the same word in the two premises with a different meaning. According to Kant the method adopted by the rational psychology of the old metaphysicians, when they assumed that the qualities of the phenomenal soul, as given in experience, formed part of its own real essence, was based upon such a Paralogism. Nor can it be denied that predicates like simplicity, permanence, etc., are inapplicable to the soul. But their unfitness is not due to the ground assigned by Kant, that Reason, by applying them, would exceed its appointed bounds. The true ground is that

this style of abstract terms is not good enough for the soul, which is very much more than a mere simple or unchangeable sort of thing. And thus, for example, while the soul may be admitted to be simple selfsameness, it is at the same time active and institutes distinctions in its own nature. But whatever is merely or abstractly simple is as such also a mere dead thing. By his polemic against the metaphysic of the past Kant discarded those predicates from the soul or mind. He did well; but when he came to state his reasons, his failure is apparent.

§ 48

[b] The second unconditioned object is the World (§ 35). In the attempt which reason makes to comprehend the unconditioned nature of the World, it falls into what are called Antinomies. In other words it maintains two opposite propositions about the same object, and in such a way that each of them has to be maintained with equal necessity. From this it follows that the body of cosmical fact, the specific statements descriptive of which run into contradiction, cannot be a self-subsistent reality, but only an appearance. The explanation offered by Kant alleges that the contradiction does not affect the object in its own proper essence, but attaches only to the Reason which seeks to comprehend it.

In this way the suggestion was broached that the contradiction is occasioned by the subject-matter itself, or by the intrinsic quality of the categories. And to offer the idea that the contradiction introduced into the world of Reason by the categories of Understanding is inevitable and essential was to make one of the most important steps in the progress of Modern Philosophy. But the more important the issue thus raised the more trivial was the solution. Its only motive was an excess of tenderness for the things of the world. The blemish of contradiction, it seems, could not be allowed to mar the essence of the world; but there could be no objection to

attach it to the thinking Reason, to the essence of mind. Probably nobody will feel disposed to deny that the phenomenal world presents contradictions to the observing mind; meaning by ‘phenomenal’ the world as it presents itself to the senses and understanding, to the subjective mind. But if a comparison is instituted between the essence of the world and the essence of the mind, it does seem strange to hear how calmly and confidently the modest dogma has been advanced by one, and repeated by others, that thought or Reason, and not the World, is the seat of contradiction. It is no escape to turn round and explain that Reason falls into contradiction only by applying the categories. For this application of the categories is maintained to be necessary, and Reason is not supposed to be equipped with any other forms but the categories for the purpose of cognition. But cognition is determining and determinate thinking: so that, if Reason be mere empty indeterminate thinking, it thinks nothing. And if in the end Reason be reduced to mere identity without diversity (see next §), it will in the end also win a happy release from contradiction at the slight sacrifice of all its facets and contents.

It may also be noted that his failure to make a more thorough study of Antinomy was one of the reasons why Kant enumerated only *four* Antinomies. These four attracted his notice, because, as may be seen in his discussion of the so-called Paralogisms of Reason, he assumed the list of the categories as a basis of his argument. Employing what has subsequently become a favourite fashion, he simply put the object under a rubric otherwise ready to hand, instead of deducing its characteristics from its notion. Further deficiencies in the treatment of the Antinomies I have pointed out, as occasion offered, in my *Science of Logic*. Here it will be sufficient to say that the Antinomies are not confined to the four special objects taken from Cosmology: they appear in all objects of every kind, in all conceptions, notions, and Ideas. To be aware of this and to know objects

in this property of theirs makes a vital part in a philosophical theory. For the property thus indicated is what we shall afterwards describe as the *Dialectical* influence in logic.

The principles of the metaphysical philosophy gave rise to the belief that, when cognition lapsed into contradictions, it was a mere accidental aberration, due to some subjective mistake in argument and inference. According to Kant, however, thought has a natural tendency to issue in contradictions or antinomies, whenever it seeks to apprehend the infinite. We have in the latter part of the above paragraph referred to the philosophical importance of the antinomies of reason, and shown how the recognition of their existence helped largely to get rid of the rigid dogmatism of the metaphysic of understanding, and to direct attention to the Dialectical movement of thought. But here too Kant, as we must add, never got beyond the negative result that the thing-in-itself is unknowable, and never penetrated to the discovery of what the antinomies really and positively mean. That true and positive meaning of the antinomies is this: that every actual thing involves a coexistence of opposed elements. Consequently to know, or, in other words, to comprehend an object is equivalent to being conscious of it as a concrete unity of opposed determinations. The old metaphysic, as we have already seen, when it studied the objects of which it sought a metaphysical knowledge, went to work by applying categories abstractly and to the exclusion of their opposites.

Kant, on the other hand, tried to prove that the statements issuing through this method could be met by other statements of contrary import with equal warrant and equal necessity. In the enumeration of these antinomies he narrowed his ground to the cosmology of the old metaphysical system, and in his discussion made out four antinomies, a number which rests upon the list of the categories. The first antinomy is on

the question: Whether we are or are not to think the world limited in space and time. In the second antinomy we have a discussion of the dilemma: Matter must be conceived either as endlessly divisible, or as consisting of atoms. The third antinomy bears upon the antithesis of freedom and necessity, to such extent as it is embraced in the question, Whether everything in the world must be supposed subject to the condition of causality, or if we can also assume free beings, in other words absolute initial points of action, in the world. Finally, the fourth antinomy is the dilemma: Either the world as a whole has a cause or it is uncaused.

The method which Kant follows in discussing these antinomies is as follows. He puts the two propositions implied in the dilemma over against each other as thesis and antithesis, and seeks to prove both: that is to say he tries to exhibit them as inevitably issuing from reflection on the question. He particularly protests against the charge of being a special pleader and of grounding his reasoning on illusions. Speaking honestly, however, the arguments which Kant offers for his thesis and antithesis are mere shams of demonstration. The thing to be proved is invariably implied in the assumption he starts from, and the speciousness of his proofs is only due to his prolix and apagogic mode of procedure. Yet it was, and still is, a great achievement for the Critical Philosophy when it exhibited these antinomies: for in this way it gave some expression (at first certainly subjective and unexplained) to the actual unity of those categories which are kept persistently separate by the understanding. The first of the cosmological antinomies, for example, implies a recognition of the doctrine that space and time present a discrete as well as a continuous aspect: whereas the old metaphysic, laying exclusive emphasis on the continuity, had been led to treat the world as unlimited in space and time. It is quite correct to say that we can go beyond every *definite* space and beyond every *definite* time: but it is no less correct that space and time are real and actual only when they

are defined or specialised into ‘here’ and ‘now’ — a specialisation which is involved in the very notion of them. The same observations apply to the rest of the antinomies. Take, for example, the antinomy of freedom and necessity. The main gist of it is that freedom and necessity as understood by abstract thinkers are not independently real, as these thinkers suppose, but merely ideal factors (moments) of the true freedom and the true necessity, and that to abstract and isolate either conception is to make it false.

§ 49

The third object of the Reason is God (§ 36): he also must be known and defined in terms of thought. But in comparison with an unalloyed identity, every defining term as such seems to the understanding to be only a limit and a negation: every reality accordingly must be taken as limitless, i.e. undefined. Accordingly God, when he is defined to be the sum of all realities, the most real of beings, turns into a *mere abstract*. And the only term under which that most real of real things can be defined is that of Being itself the height of abstraction. These are two elements, abstract identity, on one hand, which is spoken of in this place as the notion; and Being on the other which Reason seeks to unify. And their union is the *Ideal* of Reason.

§ 50

To carry out this unification two ways or two forms are admissible. Either we may begin with Being and proceed to the *abstractum* of Thought: or the movement may begin with the abstraction and end in Being.

We shall, in the first place, start from Being. But Being, in its natural aspect, presents itself to view as a Being of infinite variety, a World in all its plentitude. And this world may be regarded in two ways: first, as a collection of innumerable unconnected facts; and second, as a collection of

innumerable facts in mutual relation, giving evidence of design. The first aspect is emphasised in the Cosmological proof; the latter in the proofs of Natural Theology. Suppose now that this fullness of being passes under the agency of thought. Then it is stripped of its isolation and unconnectedness, and viewed as a universal and absolutely necessary being which determines itself and acts by general purposes or laws. And this necessary and self-determined being, different from the being at the commencement, is God.

The main force of Kant's criticism on this process attacks it for being a syllogising, i.e. a transition. Perceptions, and that aggregate of perceptions we call the world, exhibit as they stand no traces of that universality which they afterwards receive from the purifying act of thought. The empirical conception of the world therefore gives no warrant for the idea of universality. And so any attempt on the part of thought to ascend from the empirical conception of the world to God is checked by the argument of Hume (as in the paralogisms, § 47), according to which we have no right to think sensations, that is, to elicit universality and necessity from them.

Man is essentially a thinker: and therefore sound Common Sense, as well as Philosophy, will not yield up their right of rising to God from and out of the empirical view of the world. The only basis on which this rise is possible is the thinking study of the world, not the bare sensuous, animal, attuition of it. Thought and thought alone has eyes for the essence, substance, universal power, and ultimate design of the world. And what men call the proofs of God's existence are, rightly understood, ways of describing and analysing the native course of the mind, the course of *thought* thinking the *data* of the senses. The rise of thought beyond the world of sense, its passage from the finite to the infinite, the leap into the supersensible which it takes when it snaps asunder the chain of sense, all this transition is thought and nothing but thought. Say there must be no such passage, and you say there is to be no thinking. And in sooth, animals make

no such transition. They never get further than sensation and the perception of the senses, and in consequence they have no religion.

Both on general grounds, and in the particular case, there are two remarks to be made upon the criticism of this exaltation in thought. The first remark deals with the question of form. When the exaltation is exhibited in a syllogistic process, in the shape of what we call *proofs* of the being of God, these reasonings cannot but start from some sort of theory of the world, which makes it an aggregate either of contingent facts or of final causes and relations involving design. The merely syllogistic thinker may deem this starting-point a solid basis and suppose that it remains throughout in the same empirical light, left at last as it was at the first. In this case, the bearing of the beginning upon the conclusion to which it leads has a purely affirmative aspect, as if we were only reasoning from one thing which *is* and continues to *be,* to another thing which in like manner is. But the great error is to restrict our notions of the nature of thought to its form in understanding alone. To think the phenomenal world rather means to recast its form, and transmute it into a universal. And thus the action of thought has also a *negative* effect upon its basis: and the matter of sensation, when it receives the stamp of universality, at once loses its first and phenomenal shape. By the removal and negation of the shell, the kernel within the sense-percept is brought to the light (§ § 13 and 23). And it is because they do not, with sufficient prominence, express the negative features implied in the exaltation of the mind from the world to God that the metaphysical proofs of the being of a God are defective interpretations and descriptions of the process. If the world is only a sum of incidents, it follows that it is also deciduous and phenomenal, in *esse* and *posse* null. That upward spring of the mind signifies that the being which the world has is only a semblance, no real being, no absolute truth; it signifies that, beyond and above that appearance, truth abides in God, so that true being is another name for God.

The process of exaltation might thus appear to be transition and to involve a means, but it is not a whit less true that every trace of transition and means is absorbed; since the world, which might have seemed to be the means of reaching God, is explained to be a nullity. Unless the being of the world is nullified, the *point d'appui* for the exaltation is lost. In this way the apparent means vanishes, and the process of derivation is cancelled in the very act by which it proceeds. It is the affirmative aspect of this relation, as supposed to subsist between two things, either of which *is* as much as the other, which Jacobi mainly has in his eye when he attacks the demonstrations of the understanding. Justly censuring them for seeking conditions (i.e. the world) for the unconditioned, he remarks that the Infinite or God must on such a method be presented as dependent and derivative. But that elevation, as it takes place in the mind, serves to correct this semblance: in fact, it has no other meaning than to correct that semblance. Jacobi, however, failed to recognise the genuine nature of essential thought – by which it cancels the mediation in the very act of mediating; and consequently, his objection, though it tells against the merely 'reflective' understanding, is false when applied to thought as a whole, and in particular to reasonable thought.

To explain what we mean by the neglect of the negative factor in thought, we may refer by way of illustration to the charges of Pantheism and Atheism brought against the doctrines of Spinoza. The absolute Substance of Spinoza certainly falls short of absolute spirit, and it is a right and proper requirement that God should be defined as absolute spirit. But when the definition in Spinoza is said to identify the world with God, and to confound God with nature and the finite world, it is implied that the finite world possesses a genuine actuality and affirmative reality. If this assumption be admitted, of course a union of God with the world renders God completely finite, and degrades Him to the bare finite and adventitious

congeries of existence. But there are two objections to be noted. In the first place Spinoza does not define God as the unity of God with the world, but as the union of thought with extension, that is, with the material world. And secondly, even if we accept this awkward popular statement as to this unity, it would still be true that the system of Spinoza was not Atheism but Acosmism, defining the world to be an appearance lacking in true reality. A philosophy which affirms that God and God alone is should not be stigmatised as atheistic, when even those nations which worship the ape, the cow, or images of stone and brass, are credited with some religion. But as things stand the imagination of ordinary men feels a vehement reluctance to surrender its dearest conviction, that this aggregate of finitude, which it calls a world, has actual reality; and to hold that there is no world is a way of thinking they are fain to believe impossible, or at least much less possible than to entertain the idea that there is no God. Human nature, not much to its credit, is more ready to believe that a system denies God, than that it denies the world. A denial of God seems so much more intelligible than a denial of the world.

The second remark bears on the criticism of the material propositions to which that elevation in thought in the first instance leads. If these ‘propositions have for their predicate such terms as substance of the world, its necessary essence, cause which regulates and directs it according to design, they are certainly inadequate to express what is or ought to be understood by God. Yet apart from the trick of adopting a preliminary popular conception of God, and criticising a result by this assumed standard, it is certain that these characteristics have great value, and are necessary factors in the idea of God. But if we wish in this way to bring before thought the genuine idea of God, and give its true value and expression to the central truth, we must be careful not to start from a

subordinate level of facts. To speak of the 'merely contingent' things of the world is a very inadequate description of the premises.

The organic structures, and the evidence they afford of mutual adaptation, belong to a higher province, the province of animated nature. But even without taking into consideration the possible blemish which the study of animated nature and of the other teleological aspects of existing things may contract from the pettiness of the final causes, and from puerile instances of them and their bearings, merely animated nature is, at the best, incapable of supplying the material for a truthful expression to the idea to God. God is more than life: he is Spirit. And therefore if the thought of the Absolute takes a starting-point for its rise, and desires to take the nearest, the most true and adequate starting-point will be found in the nature of spirit alone.

§ 51

The other way of unification by which to realise the Ideal of Reason is to set out from the *abstractum* of Thought and seek to characterise it: for which purpose Being is the only available term. This is the method of the Ontological proof. The opposition, here presented from a merely subjective point of view, lies between Thought and Being; whereas in the first way of junction, being is common to the two sides of the antithesis, and the contrast lies only between its individualisation and universality. Understanding meets this second way with what is implicitly the same objection as it made to the first. It denied that the empirical involves the universal; so it denies that the universal involves the specialisation, which specialisation in this instance is being. In other words it says: Being cannot be deduced from the notion by any analysis.

The uniformly favourable reception and acceptance which attended Kant's criticism of the Ontological proof was undoubtedly due to the

illustration which he made use of. To explain the difference between thought and being, he took the instance of a hundred sovereigns, which, for anything it matters to the notion, are the same hundred whether they are real or only possible, though the difference of the two cases is very perceptible in their effect on a man's purse. Nothing can be more obvious than that anything we only think or conceive is not on that account actual; that mental representation, and even notional comprehension, always falls short of being. Still it may not unfairly be styled a barbarism in language, when the name of notion is given to things like a hundred sovereigns. And, putting that mistake aside, those who perpetually urge against the philosophic Idea the difference between Being and Thought might have admitted that philosophers were not wholly ignorant of the fact. Can there be any proposition more trite than this? But after all, it is well to remember, when we speak of God, that we have an object of another kind than any hundred sovereigns, and unlike any one particular notion, representation, or however else it may be styled. It is in fact this and this alone which marks everything finite: its being in time and space is discrepant from its notion. God, on the contrary, expressly has to be what can only be 'thought as existing'; his notion involves being. It is this unity of the notion and being that constitutes the notion of God.

If this were all, we should have only a formal expression of the divine nature which would not really go beyond a statement of the nature of the notion itself. And that the notion, in its most abstract terms, involves being is plain. For the notion, whatever other determination it may receive, is at least reference back on itself, which results by abolishing the intermediation, and thus is immediate. And what is that reference to self, but being? Certainly it would be strange if the notion, the very inmost of mind, if even the 'Ego', or above all the concrete totality we call God, were not rich enough to include so poor a category as being, the very poorest and

most abstract of all. For, if we look at the thought it holds, nothing can be more insignificant than being. And yet there may be something still more insignificant than being that which at first sight is perhaps supposed to *be*, an external and sensible existence, like that of the paper lying before me. However, in this matter, nobody proposes to speak of the sensible existence of a limited and perishable thing. Besides, the petty stricture of the *Kritik* that 'thought and being are different' can at most molest the path of the human mind from the thought of God to the certainty that he is: it cannot take it away. It is this process of transition, depending on the absolute inseparability of the thought of God from his being, for which its proper authority has been revindicated in the theory of faith or immediate knowledge — whereof hereafter.

§ 52

In this way thought, at its highest pitch, has to go outside for any determinateness; and although it is continually termed Reason, is out-and-out abstract thinking. And the result of all is that Reason supplies nothing beyond the formal unity required to simplify and systematise experiences; it is a *canon*, not an *organon*, of truth, and can furnish only a criticism of knowledge, not a *doctrine* of the infinite. In its final analysis this criticism is summed up in the assertion that in strictness thought is only the indeterminate unity and the action of this indeterminate unity.

Kant undoubtedly held reason to be the faculty of the unconditioned but if reason be reduced to abstract identity only, it by implication renounces its unconditionality and is in reality no better than empty understanding. For reason is unconditioned only in so far as its character and quality are not due to an extraneous and foreign content, only in so far as it is self-characterising, and thus, in point of content, is its own master. Kant, however, expressly explains that the action of reason consists solely in

applying the categories to systematise the matter given by perception, i.e. to place it in an outside order, under the guidance of the principle of non-contradiction.

§ 53

(b) The Practical Reason is understood by Kant to mean a *thinking* Will, i.e. a Will that determines itself on universal principles. Its office is to give objective, imperative laws of freedom laws, that is, which state what ought to happen. The warrant for thus assuming thought to be an activity which makes itself felt objectively, that is, to be really a Reason, is the alleged possibility of proving practical freedom by experience, that is, of showing it in the phenomenon of selfconsciousness. This experience in consciousness is at once met by all that the Necessitarian produces from contrary experience, particularly by the sceptical induction (employed among others by Hume) from the endless diversity of what men regard as right and duty i.e. from the diversity apparent in those professedly objective laws of freedom.

§ 54

What, then, is to serve as the law which the Practical Reason embraces and obeys, and as the criterion in its act of selfdetermination? There is no rule at hand but the same abstract identity of understanding as before: there must be no contradiction in the act of self- determination. Hence the Practical Reason never shakes off the formalism which is represented as the climax of the Theoretical Reason.

But this Practical Reason does not confine the universal principle of the Good to its own inward regulation: it first becomes *practical*, in the true sense of the word, when it insists on the Good being manifested in the world with an outward objectivity, and requires that the thought shall be

objective throughout, and not merely subjective. We shall speak of this postulate of the Practical Reason afterwards.

The free self-determination which Kant denied to the speculative, he has expressly vindicated for the practical reason. To many minds this particular aspect of the Kantian philosophy made it welcome; and that for good reasons. To estimate rightly what we owe to Kant in the matter, we ought to set before our minds the form of practical philosophy and in particular of 'moral philosophy' which prevailed in his time. It may be generally described as a system of Eudaemonism, which, when asked what man's chief end ought to be, replied Happiness. And by happiness Eudaemonism understood the satisfaction of the private appetites, wishes, and wants of the man: thus raising the contingent and particular into a principle for the will and its actualisation. To this Eudaemonism, which was destitute of stability and consistency, and which left the 'door and gate' wide open for every whim and caprice, Kant opposed the practical reason, and thus emphasised the need for a principle of will which should be universal and lay the same obligation on all. The theoretical reason, as has been made evident in the preceding paragraphs, is identified by Kant with the negative faculty of the infinite; and as it has no positive content of its own, it is restricted to the function of detecting the finitude of experiential knowledge. To the practical reason, on the contrary, he has expressly allowed a positive infinity, by ascribing to the will the power of modifying itself in universal modes, i.e. by thought. Such a power the will undoubtedly has: and it is well to remember that man is free only in so far as he possesses it and avails himself of it in his conduct. But a recognition of the existence of this power is not enough and does not avail to tell us what are the contents of the will or practical reason. Hence to say that a man must make the Good the content of his will raises the question, what that content is, and what are the means of ascertaining what good is. Nor does one get over the difficulty by

the principle that the will must be consistent with itself, or by the precept to do duty for the sake of duty.

§ 55

(c) The Reflective Power of Judgment is invested by Kant with the function of an Intuitive Understanding. That is to say, whereas the particulars had hitherto appeared, so far as the universal or abstract identity was concerned, adventitious and incapable of being deduced from it, the *Intuitive* Understanding apprehends the particulars as moulded and formed by the universal itself. Experience presents such universalised particulars in the products of Art and of *organic* nature.

The capital feature in Kant's Criticism of the Judgment is, that in it he gave a representation and a name, if not even an intellectual expression, to the Idea. Such a representation, as an Intuitive Understanding, or an inner adaptation, suggests a universal which is at the same time apprehended as essentially a concrete unity. It is in these *apercus* alone that the Kantian philosophy rises to the speculative height. Schiller, and others, have found in the idea of artistic beauty, where thought and sensuous conception have grown together into one, a way of escape from the abstract and separatist understanding. Others have found the same relief in the perception and consciousness of life and of living things, whether that life be natural or intellectual. The work of Art, as well as the living individual, is, it must be owned, of limited content. But in the postulated harmony of nature (or necessity) and free purpose in the final purpose of the world conceived as realised, Kant has put before us the Idea, comprehensive even in its content. Yet what may be called the laziness of thought, when dealing with the supreme Idea, finds a too easy mode of evasion in the 'ought to be': instead of the actual realisation of the ultimate end, it clings hard to the disjunction of the notion from reality. Yet if thought will not *think* the ideal realised, the

senses and the intuition can at any rate see it in the present reality of living organisms and of the beautiful in Art. And consequently Kant's remarks on these objects were well adapted to lead the mind on to grasp and think the concrete Idea.

§ 56

We are thus led to conceive a different relation between the universal of understanding and the particular of perception, than that on which the theory of the Theoretical and Practical Reason is founded. But while this is so, it is not supplemented by a recognition that the former is the genuine relation and the very truth. Instead of that, the unity (of universal with particular) is accepted only as it exists in finite phenomena, and is adduced only as a fact of experience. Such experience, at first only personal, may come from two sources. It may spring from Genius, the faculty which produces 'aesthetic ideas'; meaning by aesthetic ideas, the picture-thoughts of the free imagination which subserve an idea and suggest thoughts, although their content is not expressed in a notional form, and even admits of no such expression. It may also be due to Taste, the feeling of congruity between the free play of intuition or imagination and the uniformity of understanding.

§ 57

The principle by which the Reflective faculty of Judgment regulates and arranges the products of animated nature is described as the End or final cause the notion in action, the universal at once determining and determinate in itself. At the same time Kant is careful to discard the conception of external or finite adaptation, in which the End is only an adventitious form for the means and material in which it is realised. In the living organism, on the contrary, the final cause is a moulding principle and

an energy immanent in the matter, and every member is in its turn a means as well as an end.

§ 58

Such an Idea evidently radically transforms the relation which the understanding institutes between means and ends, between subjectivity and objectivity. And yet in the face of this unification, the End or design is subsequently explained to be a cause which exists and acts subjectively, i.e. as our idea only: and teleology is accordingly explained to be only a principle of criticism, purely personal to our understanding.

After the Critical philosophy had settled that Reason can know phenomena only, there would still have been an option for animated nature between two equally subjective modes of thought. Even according to Kant’s own exposition, there would have been an obligation to admit, in the case of natural productions, a knowledge not confined to the categories of quality, cause and effect, composition, constituents, and so on. The principle of inward adaptation or design, had it been kept to and carried out in scientific application, would have led to a different and a higher method of observing nature.

§ 59

If we adopt this principle, the Idea, when all limitations were removed from it, would appear as follows. The universality moulded by Reason, and described as the absolute and final end or the Good, would be realised in the world, and realised moreover by means of a third thing, the power which proposes this End as well as realises it that is, God. Thus in him, who is the absolute truth, those oppositions of universal and individual, subjective and objective, are solved and explained to be neither self-subsistent nor true.

But Good which is thus put forward as the final cause of the world has been already described as only *our* good, the moral law of *our* Practical Reason. This being so, the unity in question goes no further than make the state of the world and the course of its events harmonise with our moral standards. Besides, even with this limitation, the final cause, or Good, is a vague abstraction, and the same vagueness attaches to what is to be Duty. But, further, this harmony is met by the revival and reassertion of the antithesis, which it by its own principle had nullified. The harmony is then described as merely subjective, something which merely ought to be, and which at the same time is not real a mere article of faith, possessing a subjective certainty, but without truth, or that objectivity which is proper to the Idea. This contradiction may seem to be disguised by adjourning the realisation of the Idea to a future, to a *time* when the Idea will also be. But a sensuous condition like time is the reverse of a reconciliation of the discrepancy; and an infinite progression which is the corresponding image adopted by the understanding on the very face of it only repeats and re-enacts the contradiction.

A general remark may still be offered on the result to which the Critical philosophy led as to the nature of knowledge; a result which has grown one of the current ‘idols’ or axiomatic beliefs of the day. In every dualistic system, and especially in that of Kant, the fundamental defect makes itself visible in the inconsistency of unifying at one moment what a moment before had been explained to be independent and therefore incapable of unification. And then, at the very moment after unification has been alleged to be the truth, we suddenly come upon the doctrine that the two elements, which, in their true status of unification, had been refused all independent subsistence, are only true and actual in their state of separation. Philosophising of this kind wants the little penetration needed to discover,

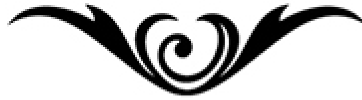
that this shuffling only evidences how unsatisfactory each one of the two terms is. And it fails simply because it is incapable of bringing two thoughts together. (And in point of form there are never more than two.) It argues an utter want of consistency to say, on the one hand, that the understanding only knows phenomena, and, on the other, assert the absolute character of this knowledge, by such statements as 'Cognition can go no further'; 'Here is the *natural* and absolute limit of human knowledge.' But 'natural' is the wrong word here. The things of nature are limited and are natural things only to such extent as they are not aware of their universal limit, or to such extent as their mode or quality is a limit from our point of view, and not from their own. No one knows, or even feels, that anything is a limit or defect, until he is at the same time above and beyond it. Living beings, for example, possess the privilege of pain which is denied to the inanimate: even with living beings, a single mode or quality passes into the feeling of a negative. For living beings as such possess within them a universal vitality, which overpasses and includes the single mode; and thus, as they maintain themselves in the negative of themselves, they feel the contradiction to exist within them. But the contradiction is within them only in so far as one and the same subject includes both the universality of their sense of life, and the individual mode which is in negation with it. This illustration will show how a limit or imperfection in knowledge comes to be termed a limit or imperfection, only when it is compared with the actually present Idea of the universal, of a total and perfect. A very little consideration might show that to call a thing finite or limited proves by implication the very presence of the infinite and unlimited, and that our knowledge of a limit can only be when the unlimited is *on this side* in consciousness.

The result however of Kant's view of cognition suggests a second remark. The philosophy of Kant could have no influence on the method of the sciences. It leaves the categories and method of ordinary knowledge

quite unmolested. Occasionally, it may be, in the first sections of a scientific work of that period, we find propositions borrowed from the Kantian philosophy; but the course of the treatise renders it apparent that these propositions were superfluous decoration, and that the few first pages might have been omitted without producing the least change in the empirical contents.

We may next institute a comparison of Kant with the metaphysics of the empirical school. Natural plain Empiricism, though it unquestionably insists most upon sensuous perception, still allows a supersensible world or spiritual reality, whatever may be its structure and constitution, and whether derived from intellect, or from imagination, etc. So far as form goes, the facts of this supersensible world rest on the authority of mind, in the same way as the other facts embraced in empirical knowledge rest on the authority of external perception. But when Empiricism becomes reflective and logically consistent, it turns its arms against this dualism in the ultimate and highest species of fact; it denies the independence of the thinking principle and of a spiritual world which develops itself in thought. Materialism or Naturalism, therefore, is the consistent and thoroughgoing system of Empiricism. In direct opposition to such an Empiricism, Kant asserts the principle of thought and freedom, and attaches himself to the first mentioned form of empirical doctrine, the general principles of which he never departed from. There is a dualism in his philosophy also. On one side stands the world of sensation, and of the understanding which reflects upon it. This world, it is true, he alleges to be a world of appearances. But that is only a title or formal description; for the source, the facts, and the modes of observation continue quite the same as in Empiricism. On the other side and independent stands a self-apprehending thought, the principle of freedom, which Kant has in common with ordinary and bygone metaphysic, but emptied of all that it held, and without his being able to

infuse into it anything new. For, in the Critical doctrine, thought, or, as it is there called, Reason, is divested of every specific form, and thus bereft of all authority. The main effect of the Kantian philosophy has been to revive the consciousness of Reason, or the absolute inwardness of thought. Its abstractness indeed prevented that inwardness from developing into anything, or from originating any special forms, whether cognitive principles or moral laws; but nevertheless it absolutely refused to accept or indulge anything possessing the character of an externality. Henceforth the principle of the independence of Reason, or of its absolute self-subsistence, is made a general principle of philosophy, as well as a foregone conclusion of the time.



(1) The Critical philosophy has one great negative merit. It has brought home the conviction that the categories of understanding are finite in their range, and that any cognitive process confined within their pale falls short of the truth. But Kant had only a sight of half the truth. He explained the finite nature of the categories to mean that they were subjective only, valid only for our thought, from which the thing-in-itself was divided by an impassable gulf. In fact, however, it is not because they are subjective that the categories are finite: they are finite by their very nature, and it is on their own selves that it is requisite to exhibit their finitude. Kant however holds that what we think is false, because it is we who think it. A further deficiency in the system is that it gives only a historical description of thought, and a mere enumeration of the factors of consciousness. The enumeration is in the main correct: but not a word touches upon the necessity of what is thus empirically colligated. The observations made on the various stages of consciousness culminant in the summary statement that the content of all we are acquainted with is only an appearance. And as it is true at least that all finite thinking is concerned with appearances, so far the conclusion is justified. This stage of ‘appearance’ however — the

phenomenal world — is not the terminus of thought: there is another and a higher region. But that region was to the Kantian philosophy an inaccessible ‘other world’.

(2) After all it was only formally that the Kantian system established the principle that thought is spontaneous and self-determining. Into details of the manner and the extent of this self-determination of thought, Kant never went. It was Fichte who first noticed the omission; and who, after he had called attention to the want of a deduction for the categories, endeavoured really to supply something of the kind. With Fichte, the ‘Ego’ is the starting-point in the philosophical development: and the outcome of its action is supposed to be visible in the categories. But in Fichte the ‘Ego’ is not really presented as a free, spontaneous energy; it is supposed to receive its first excitation by a shock or impulse from without. Against this shock the ‘Ego’ will, it is assumed, react, and only through this reaction does it first become conscious of itself. Meanwhile, the nature of the impulse remains a stranger beyond our pale: and the ‘Ego’, with something else always confronting it, is weighted with a condition. Fichte, in consequence, never advanced beyond Kant’s conclusion, that the finite only is knowable, while the infinite transcends the range of thought. What Kant calls the thing-by-itself, Fichte calls the impulse from without — that abstraction of something else than ‘I’, not otherwise describable or definable than as the negative or non-Ego in general. The ‘I’ is thus looked at as standing in essential relation with the not-I, through which its act of self-determination is first awakened. And in this manner the ‘I’ is but the continuous act of self-liberation from this impulse, never gaining a real freedom, because with the surcease of the impulse the ‘I’, whose being is its action, would also cease to be. Nor is the content produced by the action of the ‘I’ at all different from the ordinary content of experience, except by the supplementary remark, that this content is mere appearance.

V. Third Attitude of Thought to Objectivity

IMMEDIATE OR INTUITIVE KNOWLEDGE

§ 61

If we are to believe the Critical philosophy, thought is subjective, and its ultimate and invincible mode is *abstract universality* or formal identity. Thought is thus set in opposition to Truth, which is no abstraction, but concrete universality. In this highest mode of thought, which is entitled Reason, the Categories are left out of account. The extreme theory on the opposite side holds thought to be an act of the *particular* only, and on that ground declares it incapable of apprehending the Truth. This is the Intuitional theory.

§ 62

According to this theory, thinking, a private and particular operation, has its whole scope and product in the Categories. But these Categories, as arrested by the understanding, are limited vehicles of thought, forms of the conditioned, of the dependent and derivative. A thought limited to these modes has no sense of the Infinite and the True, and cannot bridge over the gulf that separates it from them. (This stricture refers to the proofs of God's existence.) These inadequate modes or categories are also spoken of as *notions*: and to get a notion of an object therefore can only mean, in this language, to grasp it under the form of being conditioned and derivative. Consequently, if the object in question be the True, the Infinite, the Unconditioned, we change it by our notions into a finite and conditioned;

whereby, instead of apprehending the truth by thought, we have perverted it into untruth.

Such is the one simple line of argument advanced for the thesis that the knowledge of God and of truth must be immediate, or intuitive. At an earlier period all sort of anthropomorphic conceptions, as they are termed, were banished from God, as being finite and therefore unworthy of the infinite; and in this way God had been reduced to a tolerably blank being. But in those days the thought-forms were in general not supposed to come under the head of anthropomorphism. Thought was believed rather to strip finitude from the conceptions of the Absolute — in agreement with the above-mentioned conviction of all ages, that reflection is the only road to truth. But now, at length, even the thought-forms are pronounced anthropomorphic, and thought itself is described as a mere faculty of Unitisation.

Jacobi has stated this charge most distinctly in the seventh supplement to his *Letters on Spinoza* — borrowing his line of argument from the works of Spinoza himself, and applying it as a weapon against knowledge in general. In his attack knowledge is taken to mean knowledge of the finite only, a process of thought from one condition in a series to another, each of which is at once conditioning and conditioned. According to such a view, to explain and to get the notion of anything, is the same as to show it to be derived from something else. Whatever such knowledge embraces, consequently, is partial, dependent, and finite, while the infinite or true, i.e. God, lies outside of the mechanical interconnection to which knowledge is said to be confined. It is important to observe that, while Kant makes the finite nature of the Categories consist mainly in the formal circumstance that they are subjective, Jacobi discusses the Categories in their own proper character, and pronounces them to be in their very import finite. What Jacobi chiefly had before his eyes, when he thus described science, was the

brilliant successes of the physical or ‘exact’ sciences in ascertaining natural forces and laws. It is certainly not on the finite ground occupied by these sciences that we can expect to meet the in-dwelling presence of the infinite. Lalande was right when he said he had swept the whole heaven with his glass, and seen no God. (See § 60n.) In the field of physical science, the universal, which is the final result of analysis, is only the indeterminate aggregate — of the external finite — in one word, Matter: and Jacobi well perceived that there was no other issue obtainable in the way of a mere advance from one explanatory clause or law to another.

§ 63

All the while the doctrine that truth exists for the mind was so strongly maintained by Jacobi, that Reason alone is declared to be that by which man lives. This Reason is the knowledge of God. But, seeing that derivative knowledge is restricted to the compass of finite facts, Reason is knowledge underivative, or Faith.

Knowledge, Faith, Thought, Intuition are the categories that we meet with on this line of reflection. These terms, as presumably familiar to every one, are only too frequently subjected to an arbitrary use, under no better guidance than the conceptions and distinctions of psychology, without any investigation into their nature and notion, which is the main question after all. Thus, we often find knowledge contrasted with faith, and faith at the same time explained to be an underivative or intuitive knowledge — so that it must be at least some sort of knowledge. And, besides, it is unquestionably a fact of experience, firstly, that what we believe is in our consciousness — which implies that we *know about it;* and secondly, that this belief is a certainty in our consciousness — which implies that we *know it.* Again, and especially, we find thought opposed to immediate knowledge and faith, and, in particular, to intuition. But if this intuition be qualified as

intellectual, we must really mean intuition which thinks, unless, in a question about the nature of God, we are willing to interpret intellect to mean images and representations of imagination. The word faith or belief, in the dialect of this system, comes to be employed even with reference to common objects that are present to the senses. We believe, says Jacobi, that we have a body — we believe in the existence of the things of sense. But if we are speaking of faith in the True and Eternal, and saying that God is given and revealed to us in immediate knowledge or intuition, we are concerned not with the things of sense, but with objects special to our thinking mind, with truths of inherently universal significance. And when the individual 'I', or in other words personality, is under discussion — not the 'I' of experience, or a single private person — above all, when the personality of God is before us, we are speaking of personality unalloyed — of a personality in its own nature universal. Such personality is a thought, and falls within the province of thought only. More than this. Pure and simple intuition is completely the same as pure and simple thought. Intuition and belief, in the first instance, denote the definite conceptions we attach to these words in our ordinary employment of them: and to this extent they differ from thought in certain points which nearly every one can understand. But here they are taken in a higher sense, and must be interpreted to mean a belief in God, or an intellectual intuition of God; in short, we must put aside all that especially distinguishes thought on the one side from belief and intuition on the other. How belief and intuition, when transferred to these higher regions, differ from thought, it is impossible for any one to say. And yet, such are the barren distinctions of words, with which men fancy that they assert an important truth; even while the formulae they maintain are identical with those which they impugn.

The term *Faith* brings with it the special advantage of suggesting the faith of the Christian religion; it seems to include Christian faith, or perhaps

even to coincide with it; and thus the Philosophy of Faith has a thoroughly orthodox and Christian look, on the strength of which it takes the liberty of uttering its arbitrary dicta with greater pretension and authority. But we must not let ourselves be deceived by the semblance surreptitiously secured by a merely verbal similarity. The two things are radically distinct. Firstly, the Christian faith comprises in it an authority of the Church: but the faith of Jacobi's philosophy has no other authority than that of a personal revelation. And, secondly, the Christian faith is a copious body of objective truth, a system of knowledge and doctrine: while the scope of the philosophic faith is so utterly indefinite, that, while it has room for the faith of the Christian, it equally admits a belief in the divinity of the Dalai Lama, the ox, or the monkey — thus, so far as it goes, narrowing Deity down to its simplest terms, a 'Supreme Being'. Faith itself, taken in this professedly philosophical sense, is nothing but the sapless abstract of immediate knowledge — a purely formal category applicable to very different facts; and it ought never to be confused or identified with the spiritual fullness of Christian faith, whether we look at that faith in the heart of the believer and the indwelling of the Holy Spirit, or in the system of theological doctrine.

With what is here called faith or immediate knowledge must also be identified inspiration, the heart's revelations, the truths implanted in man by nature, and also in particular, healthy reason or Common Sense, as it is called. All these forms agree in adopting as their leading principle the immediacy, or self-evident way, in which a fact or body of truths is presented in consciousness.

§ 64

This immediate knowledge, consists in knowing that the Infinite, the Eternal, the God which is in our Idea, really *is:* or, it asserts that in our

consciousness there is immediately and inseparably bound up with this idea the certainty of its actual being.

To seek to controvert these maxims of immediate knowledge is the last thing philosophers would think of. They may rather find occasion for self-gratulation when these ancient doctrines, expressing as they do the general tenor of philosophic teaching, have, even in this unphilosophical fashion, become to some extent universal convictions of the age. The true marvel rather is that any one could suppose that these principles were opposed to philosophy — the maxims, viz., that whatever is held to be true is immanent in the mind, and that there is truth for the mind (§ 63). From a formal point of view, there is a peculiar interest in the maxim that the being of God is immediately and inseparably bound up with the thought of God, that objectivity is bound up with the subjectivity which the thought originally presents. Not content with that, the philosophy of immediate knowledge goes so far in its one-sided view, as to affirm that the attribute of existence, even in perception, is quite as inseparably connected with the conception we have of our own bodies and of external things, as it is with the thought of God. Now it is the endeavour of philosophy to prove such a unity, to show that it lies in the very nature of thought and subjectivity, to be inseparable from being and objectivity. In these circumstances therefore, philosophy, whatever estimate may be formed of the character of these proofs, must in any case be glad to see it shown and maintained that its maxims are facts of consciousness, and thus in harmony with experience. The difference between philosophy and the asseverations of immediate knowledge rather centres in the exclusive attitude which immediate knowledge adopts, when it sets itself up against philosophy.

And yet it was as a self-evident or immediate truth that the *cogito, ergo sum* of Descartes, the maxim on which may be said to hinge the whole interest of Modern Philosophy, was first stated by its author. The man who

calls this a syllogism, must know little more about a syllogism than that the word '*ergo*' ["therefore"] occurs in it. Where shall we look for the middle term? And a middle term is a much more essential point of a syllogism than the word 'ergo'. If we try to justify the name, by calling the combination of ideas in Descartes an 'immediate' syllogism, this superfluous variety of syllogism is a mere name for an utterly unmediated synthesis of distinct terms of thought. That being so, the synthesis of being with our ideas, as stated in the maxim of immediate knowledge, has no more and no less claim to the title of syllogism than the axiom of Descartes has. From Hotho's '*Dissertation on the Cartesian Philosophy*' (published 1826), I borrow the quotation in which Descartes himself distinctly declares that the maxim *cogito, ergo sum* is no syllogism. The passages are *Respons. ad II Object.; De Methodo* iv; *Ep.* i. 118. From the first passage I quote the words more immediately to the point. Descartes says: 'That we are thinking beings is *prima quaedam notio quae ex nullo syllogismo concluditur*' (a certain primary notion, which is deduced from no syllogism); and goes on: '*neque cum quis dicit: Ego cogito, ergo sum sive existo, existentiam ex cogitatione per syllogismum deducit*' (nor, when one says, I think, therefore I am or exist, does he deduce existence from thought by means of a syllogism). Descartes knew what it implied in a syllogism, and so he adds that, in order to make the maxim admit of a deduction by syllogism, we should have to add the major premise: '*Illud omne quod cogitate, est sive existit*' (Everything which thinks, is or exists). Of course, he remarks, this major premise itself has to be deduced from the original statement.

The language of Descartes on the maxim that the 'I' which *thinks* must also at the same time be, his saying that this connection is given and implied in the simple perception of consciousness that this connection is the absolute first, the principle, the most certain and evident of all things, so that no scepticism can be conceived so monstrous as not to admit it — all

this language is so vivid and distinct, that the modern statements of Jacobi and others on this immediate connection can only pass for needless repetitions.

§ 65

The theory of which we are speaking is not satisfied when it has shown that mediate knowledge taken separately is an adequate vehicle of truth. Its distinctive doctrine is that immediate knowledge alone, to the total exclusion of mediation, can possess a content which is true. This exclusiveness is enough to show that the theory is a relapse into the metaphysical understanding, with its catch words ‘either-or’. And thus it is really a relapse into the habit of external mediation, the gist of which consists in clinging to those narrow and one-sided categories of the finite, which it falsely imagined itself to have left for ever behind. This point, however, we shall not at present discuss in detail. An exclusively immediate knowledge is asserted as a fact only, and in the present Introduction we can only study it from this external point of view. The real significance of such knowledge will be explained when we come to the logical question of the opposition between mediate and immediate. But it is characteristic of the view before us to decline to examine the nature of the fact, that is, the notion of it; for such an examination would itself be a step towards mediation and even towards knowledge. The genuine discussion on logical ground, therefore, must be deferred till we come to the proper province of Logic itself.

The whole of the second part of Logic, the Doctrine of Essential Being, is a discussion of the intrinsic and self-affirming unity of immediacy and mediation.

§ 66

Beyond this point then we need not go: immediate knowledge is to be accepted as a *fact*. Under these circumstances examination is directed to the field of experience, to a psychological phenomenon. If that be so, we need only note, as the commonest of experiences, that truths which we well know to be results of complicated and highly mediated trains of thought present themselves immediately and without effort to the mind of any man who is familiar with the subject. The mathematician, like everyone who has mastered a particular science, meets any problem with ready-made solutions which presuppose most complicated analyses: and every educated man has a number of general views and maxims which he can muster without trouble, but which can only have sprung from frequent reflection and long experience. The facility we attain in any sort of knowledge, art, or technical expertness, consists in having the particular knowledge or kind of action present to our mind in any case that occurs, even, we may say, immediate in our very limbs, in an outgoing activity. In all these instances, immediacy of knowledge is so far from excluding mediation, that the two things are linked together — immediate knowledge being actually the product and result of mediated knowledge.

It is no less obvious that immediate *existence* is bound up with its mediation. The seed and the parents are immediate and initial existences in respect of the offspring which they generate. But the seed and the parents, though they exist and are therefore immediate, are yet in their turn generated; and the child, without prejudice to the mediation of its existence, is immediate, because it is. The fact that I am in Berlin, my immediate presence here, is mediated by my having made the journey hither.

§ 67

One thing may be observed with reference to the immediate knowledge of God, of legal and ethical principles (including under the head of immediate

knowledge what is otherwise termed Instinct, Implanted or Innate Ideas, Common Sense, Natural Reason, or whatever form, in short, we give to the original spontaneity). It is a matter of general experience that education or development is required to bring out into consciousness what is therein contained. It was so even with the Platonic reminiscence; and the Christian rite of baptism, although a sacrament, involves the additional obligation of a Christian upbringing. In short, religion and morals, however much they may be faith or immediate knowledge, are still on every side conditioned by the mediating process which is termed development, education, training.

The adherents, no less than the assailants, of the doctrine of Innate Ideas have been guilty throughout of the like exclusiveness and narrowness as is here noted. They have drawn a hard and fast line between the essential and immediate union (as it may be described) of certain universal principles with the soul, and another union which has to be brought about in an external fashion, and through the channel of *given* objects and conceptions. There is one objection, borrowed from experience, which was raised against the doctrine of Innate Ideas. All men, it was said, must have these ideas; they must have, for example, the maxim of contradiction present in the mind — they must be aware of it; for this maxim and others like it were included in the class of Innate Ideas. The objection may be set down to misconception; for the principles in question, though innate, need not on that account have the form of ideas or conceptions of something we are aware of. Still, the objection completely meets and overthrows the crude theory of immediate knowledge, which expressly maintains its formulae in so far as they are in consciousness. Another point calls for notice. We may suppose it admitted by the intuitive school, that the special case of religious faith involves supplementing by a Christian or religious education and development. In that case it is acting capriciously when it seeks to ignore this admission when speaking about faith, or it betrays a want of reflection

not to know, that, if the necessity of education be once admitted, mediation is pronounced indispensable.

The reminiscence of ideas spoken of by Plato is equivalent to saying that ideas implicitly exist in man, instead of being, as the Sophists assert, a foreign importation into his mind. But to conceive knowledge as reminiscence does not interfere with, or set aside as useless, the development of what is implicitly in man; which development is another word for mediation. The same holds good of the innate ideas that we find in Descartes and the Scotch philosophers. These ideas are only potential in the first instance, and should be looked at as being a sort of mere capacity in man.

§ 68

In the case of these experiences the appeal turns upon something that shows itself bound up with immediate consciousness. Even if this combination be in the first instance taken as an external and empirical connection, still, even for empirical observation, the fact of its being constant shows it to be essential and inseparable. But, again, if this immediate consciousness, as exhibited in experience, be taken separately, so far as it is a consciousness of God and the divine nature, the state of mind which it implies is generally described as an exaltation above the finite, above the senses, and above the instinctive desires and affections of the natural heart: which exaltation passes over into, and terminates in, faith in God and a divine order. It is apparent, therefore, that, though faith may be an immediate knowledge and certainty, it equally implies the interposition of this process as its antecedent and condition.

It has been already observed, that the so-called proofs of the being of God, which start from finite being, give an expression to this exaltation. In that light they are no inventions of an oversubtle reflection, but the

necessary and native channel in which the movement of mind runs: though it may be that, in their ordinary form, these proofs have not their correct and adequate expression.

§ 69

It is the passage (§ 64) from the subjective Idea to being which forms the main concern of the doctrine of immediate knowledge. A primary and self-evident interconnection is declared to exist between our Idea and being. Yet precisely this central point of transition, utterly irrespective of any connections which show in experience, clearly involves a mediation. And the mediation is of no imperfect or unreal kind, where the mediation takes place with and through something external, but one comprehending both antecedent and conclusion.

§ 70

For, what this theory asserts is that truth lies neither in the Idea as a merely subjective thought, nor in mere being on its own account — that mere being *per se*, a being that is not of the Idea, is the sensible finite being of the world. Now all this only affirms, without demonstration, that the Idea has truth only by means of being, and being has truth only by means of the Idea. The maxim of immediate knowledge rejects an indefinite empty immediacy (and such is abstract being, or pure unity taken by itself), and affirms in its stead the unity of the Idea with being. And it acts rightly in so doing. But it is stupid not to see that the unity of distinct terms or modes is not merely a purely immediate unity, i.e. unity empty and indeterminate, but that — with equal emphasis — the one term is shown to have truth only as mediated through the other — or, if the phrase be preferred, that either term is only mediated with truth through the other. That the quality of mediation is involved in the very immediacy of intuition is thus exhibited as a fact,

against which understanding, conformably to the fundamental maxim of immediate knowledge that the evidence of consciousness is infallible, can have nothing to object. It is only ordinary abstract understanding which takes the terms of mediation and immediacy, each by itself absolutely, to represent an inflexible line of distinction, and thus draws upon its own head the hopeless task of reconciling them. The difficulty, as we have shown, has no existence in the fact, and it vanishes in the speculative notion.

§ 71

The one-sidedness of the intuitional school has certain characteristics attending upon it, which we shall proceed to point out in their main features, now that we have discussed the fundamental principle. The *first* of these corollaries is as follows. Since the criterion of truth is found, not in the nature of the content, but in the mere fact of consciousness, every alleged truth has no other basis than subjective certitude and the assertion that we discover a certain fact in our consciousness. What I discover in my consciousness is thus exaggerated into a fact of the consciousness of all, and even passed off for the very nature of consciousness.

Among the so-called proofs of the existence of God, there used to stand the *consensus gentium*, to which appeal is made as early as Cicero. The *consensus gentium* is a weighty authority, and the transition is easy and natural, from the circumstance that a certain fact is found in the consciousness of every one to the conclusion that it is a necessary element in the very nature of consciousness. In this category of general agreement there was latent the deep-rooted perception, which does not escape even the least cultivated mind, that the consciousness of the individual is at the same time particular and accidental. Yet unless we examine the nature of this consciousness itself, stripping it of its particular and accidental elements and, by the toilsome operation of reflection disclosing the universal in its

entirety and purity, it is only a unanimous agreement upon a given point that can authorise a decent presumption that that point is part of the very nature of consciousness.

Of course, if thought insists on seeing the necessity of what is presented as a fact of general occurrence, the *consensus gentium* is certainly not sufficient. Yet even granting the universality of the fact to be a satisfactory proof, it has been found impossible to establish the belief in God on such an argument, because experience shows that there are individuals and nations without any such faith.

In order to judge of the greater or less extent to which Experience shows cases of Atheism or of the belief in God, it is all-important to know if the mere general conception of deity suffices, or if a more definite knowledge of God is required. The Christian world would certainly refuse the title of God to the idols of the Hindus and the Chinese, to the fetishes of the Africans, and even to the gods of Greece themselves. If so, a believer in these idols would not be a believer in God. If it were contended, on the other hand, that such a belief in idols implies some sort of belief in God, as the species implies the genus, then idolatry would argue not faith in an idol merely, but faith in God. The Athenians took an opposite view. The poets and philosophers who explained Zeus to be a cloud, and maintained that there was only one God, were treated as atheists at Athens.

The danger in these questions lies in looking at what the mind may make out of an object, and not what that object actually and explicitly is. If we fail to note this distinction, the commonest perceptions of men's senses will be religion: for every such perception, and indeed every act of mind, implicitly contains the principle which, when it is purified and developed, rises to religion. But to be capable of religion is one thing, to have it another. And religion yet implicit is only a capacity or a possibility.

Thus in modern times, travellers have found tribes (as Captains Ross and Parry found the Esquimaux) which, as they tell us, have not even that small modicum of religion possessed by African sorcerers, the *goetes* of Herodotus. On the other hand, an Englishman, who spent the first months of the last Jubilee at Rome, says, in his account of the modern Romans, that the common people are bigots, whilst those who can read and write are atheists to a man.

The charge of Atheism is seldom heard in modern times: principally because the facts and the requirements of religion are reduced to a minimum. (See § 73.)

But there can be nothing shorter and more convenient than to have the bare assertion to make, that we discover a fact in our consciousness, and are certain that it is true: and to declare that this certainty, instead of proceeding from our particular mental constitution only, belongs to the very nature of the mind.

§ 72

A second corollary which results from holding immediacy of consciousness to be the criterion of truth is that all superstition or idolatry is allowed to be truth, and that an apology is prepared for any contents of the will, however wrong and immoral. It is because he believes in them, and not from the reasoning and syllogism of what is termed mediate knowledge, that the Hindu finds God in the cow, the monkey, the Brahmin, or the Lama. But, the natural desires and affections spontaneously carry and deposit their interests in consciousness, where also immoral aims make themselves naturally at home: the good or bad character would thus express the *definite being* of the will, which would be known, and that most immediately, in the interests and aims.

§ 73

Thirdly and lastly, the immediate consciousness of God goes no further than to tell us *that* he is: to tell us *what* he is would be an act of cognition, involving mediation. So that God as an object of religion is expressly narrowed down to the indeterminate supersensible, God in general: and the significance of religion is reduced to a minimum.

If it were really needful to win back and secure the bare belief that there is a God, or even to create it, we might well wonder at the poverty of the age which can see a gain in the merest pittance of religious consciousness, and which in its church has sunk so low as to worship at the altar that stood in Athens long ago, dedicated to the 'Unknown God'.

§ 74

We have still briefly to indicate the general nature of the form of immediacy. For it is the essential one-sidedness of the category which makes whatever comes under it one-sided and, for that reason, finite. And, first, it makes the universal no better than an abstraction external to the particulars, and God a being without determinate quality. But God can only be called a spirit when he is known to be at once the beginning and end, as well as the mean, in the process of mediation. Without this unification of elements he is neither concrete, nor living, nor a spirit. Thus the knowledge of God as a spirit necessarily implies mediation. The form of immediacy, secondly, invests the particular with the character of independent or self-centred being. But such predicates contradict the very essence of the particular — which is to be referred to something else outside. They thus invest the finite with the character of an absolute. But, besides, the form of immediacy is altogether abstract: it has no preference for one set of contents more than another, but is equally susceptible of all: it may as well sanction

what is idolatrous and immoral as the reverse. Only when we discern that the content — the particular — is not self-subsistent, but derivative from something else, are its finitude and untruth shown in their proper light. Such discernment, where the content we discern carries with it the ground of its dependent nature, is a knowledge which involves mediation. The only content which can be held to be the truth is one not mediated with something else, not limited by other things: or, otherwise expressed, it is one mediated by itself, where mediation and immediate reference-to-self coincide. The understanding that fancies it has got clear of finite knowledge, the identity of the analytical metaphysicians and the old 'rationalists', abruptly takes again as principle and criterion of truth that immediacy which, as an abstract reference-to-self, is the same as abstract identity. Abstract thought (the scientific form used by 'reflective' metaphysic) and abstract intuition (the form used by immediate knowledge) are one and the same.

The stereotyped opposition between the form of immediacy and that of mediation gives to the former a half-ness and inadequacy that affects every content which is brought under it. Immediacy means, upon the whole, an abstract reference-to-self, that is, an abstract identity or abstract universality. Accordingly the essential and real universal, when taken merely in its immediacy, is a mere abstract universal; and from this point of view God is conceived as a being altogether without determinate quality. To call God spirit is in that case only a phrase: for the consciousness and self-consciousness which spirit implies are impossible without a distinguishing of it from itself and from something else, i.e. without mediation.

§ 75

It was impossible for us to criticise this, the third attitude which thought has been made to take towards objective truth, in any other mode than what is

naturally indicated and admitted in the doctrine itself. The theory asserts that immediate knowledge is a fact. It has been shown to be untrue in fact to say that there is an immediate knowledge, a knowledge without mediation either by means of something else or in itself. It has also been explained to be false in fact to say that thought advances through finite and conditioned categories only, which are always mediated by a something else, and to forget that in the very act of mediation the mediation itself vanishes. And to show that, in point of fact, there is a knowledge which advances neither by unmixed immediacy nor by unmixed mediation, we can point to the example of Logic and the whole of philosophy.

§ 76

If we view the maxims of immediate knowledge in connection with the uncritical metaphysic of the past from which we started, we shall learn from the comparison the reactionary nature of the school of Jacobi. His doctrine is a return to the modern starting-point of this metaphysic in the Cartesian philosophy. Both Jacobi and Descartes maintain the following three points:

(1) The simple inseparability of the thought and being of the thinker. *Cogito, ergo sum* is the same doctrine as that the being, reality, and existence of the 'Ego' is immediately revealed to me in consciousness. (Descartes, in fact, is careful to state that by thought he means consciousness in general. *Princip. Phil.* i. 9.) This inseparability is the absolutely first and most certain knowledge, not mediated or demonstrated.

(2) The inseparability of existence from the conception of God: the former is necessarily implied in the latter, or the conception never can be without the attribute of existence, which is thus necessary and eternal.

Descartes, *Princip. Phil.* i. 15: 'The reader will be more disposed to believe that there exists a being supremely perfect, if he notes that in the case of nothing else is there found in him an idea, in which he notices

necessary existence to be contained in the same way. He will see that that idea exhibits a true and unchangeable nature — a nature which cannot but exist, since necessary existence is contained in it.' A remark which immediately follows, and which sounds like mediation or demonstration, does not really prejudice the original principle.

In Spinoza we come upon the same statement that the essence or abstract conception of God implies existence. The first of Spinoza's definitions, that of the *Causa Sui* (or Self-Cause), explains it to be 'that of which the essence involves existence, or that whose nature cannot be conceived except as existing'. The inseparability of the notion from being is the main point and fundamental hypothesis in his system. But what notion is thus inseparable from being? Not the notion of finite things, for they are so constituted as to have a contingent and a created existence. Spinoza's eleventh proposition, which follows with a proof that God exists necessarily, and his twentieth, showing that God's existence and his essence are one and the same, are really superfluous, and the proof is more in form than in reality. To say that God is Substance, the only Substance, and that, as Substance is *Causa Sui*, God therefore exists necessarily, is merely stating that God is that of which the notion and the being are inseparable.

(3) The immediate consciousness of the existence of external things. By this nothing more is meant than sense-consciousness. To have such a thing is the slightest of all cognitions: and the only thing worth knowing about it is that such immediate knowledge of the being of things external is error and delusion, that the sensible world as such is altogether void of truth; that the being of these external things is accidental and passes away as a show; and that their very nature is to have only an existence which is separable from their essence and notion.

§ 77

There is however a distinction between the two points of view:

(1) The Cartesian philosophy, from these unproved postulates, which it assumes to be unprovable, proceeds to wider and wider details of knowledge, and thus gave rise to the sciences of modern times. The modern theory (of Jacobi), on the contrary, (§ 62) has come to what is intrinsically a most important conclusion that cognition, proceeding as it must by finite mediations, can know only the finite, and never embody the truth; and would fain have the consciousness of God go no further than the aforesaid very abstract belief that God *is*.

Anselm on the contrary says: 'Methinks it is carelessness, if, after we have been confirmed in the faith, we do not exert ourselves to see the meaning of what we believe.' [*Tractat. Cur Deus Homo?*] These words of Anselm, in connection with the concrete truths of Christian doctrine, offer a far harder problem for investigation, than is contemplated by this modern faith.

(2) The modern doctrine on the one hand makes no change in the Cartesian method of the usual scientific knowledge, and conducts on the same plan the experimental and finite sciences that have sprung from it. But, on the other hand, when it comes to the science which has infinity for its scope, it throws aside that method and thus, as it knows no other, it rejects all methods. It abandons itself to wild vagaries of imagination and assertion, to a moral priggishness and sentimental arrogance, or to a reckless dogmatising and lust of argument, which is loudest against philosophy and philosophic doctrines. Philosophy of course tolerates no mere assertions or conceits, and checks the free play of argumentative see-saw.

§ 78

We must then reject the opposition between an independent immediacy in the contents or facts of consciousness and an equally independent mediation, supposed incompatible with the former. The incompatibility is a mere assumption, an arbitrary assertion. All other assumptions and postulates must in like manner be left behind at the entrance to philosophy, whether they are derived from the intellect or the imagination. For philosophy is the science in which every such proposition must first be scrutinised and its meaning and oppositions be ascertained.

Scepticism, made a negative science and systematically applied to all forms of knowledge, might seem a suitable introduction, as pointing out the nullity of such assumptions. But a sceptical introduction would be not only an ungrateful but also a useless course; and that because Dialectic, as we shall soon make appear, is itself an essential element of affirmative science.

Scepticism, besides, could only get hold of the finite forms as they were suggested by experience, taking them as given, instead of deducing them scientifically. To require such a scepticism accomplished is the same as to insist on science being preceded by universal doubt, or a total absence of presupposition. Strictly speaking, in the resolve that *wills pure thought*, this requirement is accomplished by freedom which, abstracting from everything, grasps its pure abstraction, the simplicity of thought.

VI. Logic Defined & Divided

§ 79

IN POINT OF form Logical doctrine has three sides: [a] the Abstract side, or that of understanding; [b] the Dialectical, or that of negative reason; the Speculative, or that of positive reason.

These three sides do not make three *parts* of logic, but are stages or 'moments' in every logical entity, that is, of every notion and truth whatever. They may all be put under the first stage, that of understanding, and so kept isolated from each other; but this would give an inadequate conception of them. The statement of the dividing lines and the characteristic aspects of logic is at this point no more than historical and anticipatory.

§ 80

[a] Thought, as *Understanding*, sticks to fixity of characters and their distinctness from one another: every such limited abstract it treats as having a subsistence and being of its own.

In our ordinary usage of the term thought and even notion, we often have before our eyes nothing more than the operation of Understanding. And no doubt thought is primarily an exercise of Understanding; only it goes further, and the notion is not a function of Understanding merely. The action of Understanding may be in general described as investing its subject-matter with the form of universality. But this universal is an abstract universal: that is to say, its opposition to the particular is so rigorously maintained, that it is at the same time also reduced to the character of a

particular again. In this separating and abstracting attitude towards its objects, Understanding is the reverse of immediate perception and sensation, which, as such, keep completely to their native sphere of action in the concrete.

It is by referring to this opposition of Understanding to sensation or feeling that we must explain the frequent attacks made upon thought for being hard and narrow, and for leading, if consistently developed, to ruinous and pernicious results. The answer to these charges, in so far as they are warranted by the facts, is that they do not touch thinking in general, certainly not the thinking of Reason, but only the exercise of Understanding. It must be added, however, that the merit and rights of the mere Understanding should unhesitatingly be admitted. And that merit lies in the fact that apart from Understanding there is no fixity or accuracy in the region of theory or of practice.

Thus, in theory, knowledge begins by apprehending existing objects in their specific differences. In the study of nature, for example, we distinguish matters, forces, genera, and the like, and stereotype each in its isolation. Thought is here acting in its analytic capacity, where its canon is identity, a simple reference of each attribute to itself. It is under the guidance of the same identity that the process in knowledge is effected from one scientific truth to another. Thus, for example, in mathematics magnitude is the feature which, to the neglect of any other, determines our advance. Hence in geometry we compare one figure with another, so as to bring out their identity. Similarly in other fields of knowledge, such as jurisprudence, the advance is primarily regulated by identity. In it we argue from one specific law or precedent to another: and what is this but to proceed on the principle of identity?

But Understanding is as indispensable in practice as it is in theory. Character is an essential in conduct, and a man of character is an

understanding man, who in that capacity has definite ends in view and undeviatingly pursues them. The man who will do something great must learn, as Goethe says, to limit himself. The man who, on the contrary, would do everything, really would do nothing, and fails. There is a host of interesting things in the world: Spanish poetry, chemistry, politics, and music are all very interesting, and if any one takes an interest in them we need not find fault. But for a person in a given situation to accomplish anything, he must stick to one definite point, and not dissipate his forces in many directions. In every calling, too, the great thing is to pursue it with understanding. Thus the judge must stick to the law, and give his verdict in accordance with it, undeterred by one motive or another, allowing no excuses, and looking neither left nor right. Understanding, too, is always an element in thorough training. The trained intellect is not satisfied with cloudy and indefinite impressions, but grasps the objects in their fixed character: whereas the uncultivated man wavers unsettled, and it often costs a deal of trouble to come to an understanding with him on the matter under discussion, and to bring him to fix his eye on the definite point in question.

It has been already explained that the Logical principle in general, far from being merely a subjective action in our minds, is rather the very universal, which as such is also objective. This doctrine is illustrated in the case of understanding, the first form of logical truths. Understanding in this larger sense corresponds to what we call the goodness of God, so far as that means that finite things are and subsist. In nature, for example, we recognise the goodness of God in the fact that the various classes or species of animals and plants are provided with whatever they need for their preservation and welfare. Nor is man excepted, who, both as an individual and as a nation, possesses partly in the given circumstances of climate, or quality and products of soil, and partly in his natural parts or talents, all that is required for his maintenance and development. Under this shape

Understanding is visible in every department of the objective world; and no object in that world can ever be wholly perfect which does not give full satisfaction to the canons of understanding. A state, for example, is imperfect, so long as it has not reached a clear differentiation of orders and callings, and so long as those functions of politics and government, which are different in principle, have not evolved for themselves special organs, in the same way as we see, for example, the developed animal organism provided with separate organs for the functions of sensation, motion, digestion, &c.

The previous course of the discussion may serve to show that understanding is indispensable even in those spheres and regions of action which the popular fancy would deem furthest from it, and that in proportion as understanding is absent from them, imperfection is the result. This particularly holds good of Art, Religion, and Philosophy. In Art, for example, understanding is visible where the forms of beauty, which differ in principle, are kept distinct and exhibited in their purity. The same thing holds good also of single works of art. It is part of the beauty and perfection of a dramatic poem that the characters of the several persons should be closely and faithfully maintained, and that the different aims and interests involved should be plainly and decidedly exhibited. Or again, take the province of Religion. The superiority of Greek over Northern mythology (apart from other differences of subject-matter and conception) mainly consists in this: that in the former the individual gods are fashioned into forms of sculpture-like distinctness of outline, while in the latter the figures fade away vaguely and hazily into one another. Lastly comes Philosophy. That Philosophy never can get on without the understanding hardly calls for special remark after what has been said. Its foremost requirement is that every thought shall be grasped in its full precision, and nothing allowed to remain vague and indefinite.

It is usually added that understanding must not go too far. Which is so far correct, that understanding is not an ultimate, but on the contrary finite, and so constituted that when carried to extremes it veers round to its opposite. It is the fashion of youth to dash about in abstractions — but the man who has learnt to know life steers clear of the abstract ‘either — or’, and keeps to the concrete.

§ 81

[b] In the Dialectical stage these finite characterisations or formulae supersede themselves, and pass into their opposites.

(1) But when the Dialectical principle is employed by the understanding separately and independently — especially as seen in its application to philosophical theories — Dialectic becomes Scepticism; in which the result that ensues from its action is presented as a mere negation.

(2) It is customary to treat Dialectic as an adventitious art, which for very wantonness introduces confusion and a mere semblance of contradiction into definite notions. And in that light, the semblance is the nonentity, while the true reality is supposed to belong to the original dicta of understanding. Often, indeed, Dialectic is nothing more than a subjective seesaw of arguments *pro* and *con*, where the absence of sterling thought is disguised by the subtlety which gives birth to such arguments. But in its true and proper character, Dialectic is the very nature and essence of everything predicated by mere understanding — the law of things and of the finite as a whole. Dialectic is different from ‘Reflection’. In the first instance, Reflection is that movement out beyond the isolated predicate of a thing which gives it some reference, and brings out its relativity, while still in other respects leaving it its isolated validity. But by Dialectic is meant the indwelling tendency outwards by which the one-sidedness and limitation of the predicates of understanding is seen in its true light, and shown to be the

negation of them. For anything to be finite is just to suppress itself and put itself aside. Thus understood the Dialectical principle constitutes the life and soul of scientific progress, the dynamic which alone gives immanent connection and necessity to the body of science; and, in a word, is seen to constitute the real and true, as opposed to the external, exaltation above the finite.

Note to § 81
(1) Dialectic

It is of the highest importance to ascertain and understand rightly the nature of Dialectics. Wherever there is movement, wherever there is life, wherever anything is carried into effect in the actual world, there Dialectic is at work. It is also the soul of all knowledge which is truly scientific. In the popular way of looking at things, the refusal to be bound by the abstract deliverances of understanding appears as fairness, which, according to the proverb: “Live and let live”, demands that each should have its turn; we admit one, but we admit the other also.

But when we look more closely, we find that the limitations of the finite do not merely come from without; that its own nature is the cause of its abrogation, and that by its own act it passes into its counterpart. We say, for instance, that man is mortal, and seem to think that the ground of his death is in external circumstances only; so that if this way of looking were correct, man would have two special properties, vitality and – also – mortality. But the true view of the matter is that life as life, involves the germ of death, and that the finite, being radically self-contradictory, involves its own self-suppression.

Nor, again, is Dialectic to be confounded with mere Sophistry. The essence of Sophistry lies in giving authority to a partial and abstract principle, in its isolation, as may suit the interest and particular situation of

the individual at the time. For example, a regard to my existence, and my having the means of existence, is a vital motive of conduct, but if I exclusively emphasise this consideration or motive of my welfare, and draw the conclusion that I may steal or betray my country, we have a case of Sophistry.

Similarly, it is a vital principle in conduct that I should be subjectively free, that is to say, that I should have an insight into what I am doing, and a conviction that it is right. But if my pleading insists on this principle alone I fall into Sophistry, such as would overthrow all the principles of morality. From this sort of party-pleading, Dialectic is wholly different; its purpose is to study things in their own being and movement and thus to demonstrate the finitude of the partial categories of understanding.

Dialectic, it may be added, is no novelty in philosophy. Among the ancients Plato is termed the inventor of Dialectic; and his right to the name rests on the fact that the Platonic philosophy first gave the free scientific, and thus at the same time the objective, form to Dialectic. Socrates, as we should expect from the general character of his philosophising, has the dialectical element in a predominantly subjective shape, that of Irony. He used to turn Dialectic, first against ordinary consciousness, and then especially against the Sophists. In his conversations he used to simulate the wish for some clearer knowledge about the subject under discussion, and after putting all sorts of questions with that intent, he drew those with whom he conversed to the opposite of what their first impressions had pronounced correct.

If, for instance, the Sophists claimed to be teachers, Socrates by a series of questions forced the Sophist Protagoras to confess that all learning is only recollection. In his more strictly scientific dialogues, Plato employs the dialectical method to show the finitude of all hard and fast terms of understanding. Thus in the *Parmenides* he deduces the many from the one.

In this grand style did Plato treat Dialectic. In modern times it was, more than any other, Kant who resuscitated the name of Dialectic, and restored it to its post of honour. He did it, as we have seen, by working out the Antinomies of the reason. The problem of these Antinomies is no mere subjective piece of work oscillating between one set of grounds and another; it really serves to show that every abstract proposition of understanding, taken precisely as it is given, naturally veers round to its opposite.

However reluctant Understanding may be to admit the action of Dialectic, we must not suppose that the recognition of its existence is peculiarly confined to the philosopher. It would be truer to say that Dialectic gives expression to a law which is felt in all other grades of consciousness, and in general experience. Everything that surrounds us may be viewed as an instance of Dialectic. We are aware that everything finite, instead of being stable and ultimate, is rather changeable and transient; and this is exactly what we mean by that Dialectic of the finite, by which the finite, as implicitly other than what it is, is forced beyond its own immediate or natural being to turn suddenly into its opposite.

We have before this (§ 80) identified Understanding with what is implied in the popular idea of the goodness of God; we may now remark of Dialectic, the in same objective signification, that its principle answers to the idea of his power. All things, we say - that is, the finite world as such — are doomed; in saying so, we have a vision of Dialectic as the universal and irresistible power before which nothing can stay, however secure and stable it may deem itself. The category of power does not, it is true, exhaust the depth of the divine nature of the notion of God; but it certainly forms a vital element in all religious consciousness.

Apart from this general objectivity of Dialectic, we find traces of its presence in each of the particular provinces and phases of the natural and

spiritual world. Take as an illustration the motion of the heavenly bodies. At this moment the planet stands in this spot, but implicitly it is the possibility of being in another spot; and that possibility of being otherwise the planet brings into existence by moving. Similarly the ‘physical’ elements prove to be Dialectical. The process of meteorological action is the exhibition of their Dialectic. It is the same dynamic that lies at the root of every natural process, and, as it were, forces nature out of itself.

To illustrate the presence of Dialectic in the spiritual world, especially in the provinces of law and morality, we have only to recollect how general experience shows us the extreme of one state or action suddenly into its opposite: a Dialectic which is recognised in many ways in common proverbs. The *summum jus summa injuria*, which means that to drive an abstract right to its extremity is to do a wrong.

In political life, as every one knows, extreme anarchy and extreme despotism naturally lead to one another. The perception of Dialectic in the province of individual Ethics is seen in the well-known adages: “Pride comes before a fall”; “Too much wit outwits itself”. Even feeling, bodily as well as mental, has its dialectic. Everyone knows how the extremes of pain and pleasure pass into each other: the heart overflowing with joy seeks relief in tears, and the deepest melancholy will at times betray its presence by a smile.

Note to § 81
(2) Scepticism

Scepticism should not be looked upon merely as a doctrine of doubt. It would be more correct to say that the Sceptic has no doubt of his point, which is the nothingness of all finite existence. He who only doubts still clings to the hope that his doubt may be resolved, and that one or other of the definite views, between which he wavers, will turn out solid and true.

Scepticism properly so called is a very different thing: its is complete hopelessness about all which understanding counts stable, and the feeling to which it gives birth is one of unbroken calmness and inward repose. Such at least is the noble Scepticism of antiquity, especially as exhibited in the writings of Sextus Empiricus, when in the later times of Rome it had been systematised as a complement to the dogmatic systems of Stoic and Epicurean.

Of far other stamp, and to be strictly distinguished from it, is the modern Scepticism already mentioned (§ 39), which partly preceded the Critical Philosophy, and partly sprang out of it. That later Scepticism consisted solely in denying the truth and certitude of the supersensible, and in pointing to the facts of sense and of immediate sensations as what we have to keep to.

Even to this day Scepticism is often spoken of as the irresistible enemy of all positive knowledge, and hence of philosophy, in so far as philosophy is concerned with positive knowledge. But in these statements there is a misconception. It is only the finite thought of abstract understanding which has to fear Scepticism, because unable to withstand it: philosophy includes the sceptical principle as a subordinate function of its own, in the shape of Dialectic. In contradistinction to mere scepticism, however, philosophy does not remain content with the purely negative result of Dialectic.

The sceptic mistakes the true value of his result, when he supposes it to be no more than a negation pure and simple. For the negative which emerges as the result of dialectic is, because a result, at the same time positive: it contains what it results from, absorbed into itself, and made part of its own nature. Thus conceived, however, the dialectical stage has the features characterising the third grade of logical truth, the speculative form, or form of positive reason.

§ 82

The Speculative stage, or stage of Positive Reason, apprehends the unity of terms (propositions) in their opposition - the affirmative, which is involved in their disintegration and in their transition.

(1) The result of Dialectic is positive, because it has a definite content, or because its result is not empty and abstract nothing but the negation of certain specific propositions which are contained in the result - for the very reason that it is a resultant and not an immediate nothing.

(2) It follows from this that the 'reasonable' result, though it be only a thought and abstract, is still a concrete, being not a plain formal unity, but a unity of distinct propositions. Bare abstractions or formal thoughts are therefore no business of philosophy, which has to deal only with concrete thoughts.

(3) The logic of mere Understanding is involved in Speculative logic, and can at will be elicited from it, by the simple process of omitting the dialectical and 'reasonable' element. When that is done, it becomes what the common logic is, a descriptive collection of sundry thought-forms and rules which, finite though they are, are taken to be something infinite.

If we consider only what it contains, and not how it contains it, the true reason-world, so far from being the exclusive property of philosophy, is the right of every human being on whatever grade of culture or mental growth he may stand; which would justify man's ancient title of rational being. The general mode by which experience first makes us aware of the reasonable order of things is by accepted and unreasoned belief; and the character of the rational, as already noted (§ 45), is to be unconditioned, self-contained, and thus to be self-determining.

In this sense man above all things becomes aware of the reasonable order of things when he knows of God, and knows him to be the completely self-determined. Similarly, the consciousness a citizen has of his country and its laws is a perception of reason-world, so long as he looks up to them as

unconditioned and likewise universal powers, to which he must subject his individual will. And in the same sense, the knowledge and will of the child is rational, when he knows his parents' will, and wills it.

Now, to turn these rational (of course positively rational) realities into speculative principles, the only thing needed is that they be *thought*. The expression 'Speculation' in common life is often used with a very vague and at the same time secondary sense, as when we speak of a matrimonial or a commercial speculation. By this we only mean two things: first, that what is the subject-matter has to be passed and left behind; and secondly, that the subject-matter of such speculation, though in the first place only subjective, must not remain so, but be realised or translated into objectivity.

What was some time ago remarked respecting the Idea may be applied to this common usage of the term 'speculation'; and we may add that people who rank themselves among the educated expressly speak of speculation even as if it were something purely subjective. A certain theory of some conditions and circumstances of nature or mind may be, say these people, very fine and correct as a matter of speculation, but it contradicts experience and nothing of the sort is admissible in reality. To this the answer is, that the speculative is in its true signification, neither preliminary nor even definitively, something merely subjective: that, on the contrary, it expressly rises above such oppositions as that between subjective and objective, which the understanding cannot get over, and absorbing them in itself, evinces its own concrete and all-embracing nature.

A one-sided proposition therefore can never even give expression to a speculative truth. If we say, for example, that the absolute is the unity of subjective and objective, we are undoubtedly in the right, but so far one-sided, as we enunciate the unity only and lay the accent upon it, forgetting that in reality the subjective and objective are not merely identical but also distinct.

Speculative truth, it may also be noted, means very much the same as what, in special connection with religious experience and doctrines, used to be called Mysticism. The term Mysticism is at present used, as a rule, to designate what is mysterious and incomprehensible: and in proportion as their general culture and way of thinking vary, the epithet is applied by one class to denote the real and the true, by another to name everything connected with superstition and deception.

On which we first of all remark that there is mystery in the mystical, only however for the understanding which is ruled by the principle of abstract identity; whereas the mystical, as synonymous with the speculative, is the concrete unity of those propositions which understanding only accepts in their separation and opposition. And if those who recognise Mysticism as the highest truth are content to leave it in its original utter mystery, their conduct only proves that for them too, as well as for their antagonists, thinking means abstract identification, and that in their opinion, therefore truth can only be won by renouncing thought, or as it is frequently expressed, by leading the reason captive.

But, as we have seen, the abstract thinking of understanding is so far from being either ultimate or stable, that it shows a perpetual tendency to work its own dissolution and swing round into its opposite. Reasonableness, on the contrary, just consists in embracing within itself these opposites as unsubstantial elements. Thus the reason-world may be equally styled mystical – not however because thought cannot both reach and comprehend it, but merely because it lies beyond the compass of understanding.

Subdivision of Logic

§ 83

Logic is subdivided into three parts:

I. The Doctrine of Being.
II. The Doctrine of Essence.
III. The Doctrine of Notion and Idea.

That is, the Theory of Thought in:

I. its immediacy, the notion implicit and in germ,
II. its reflection and mediation, the being-for-self and show of the notion,
III. its return into self, and its developed abiding by itself - the notion in and for itself.

The division of Logic now given, as well as the whole of the previous discussion on the nature of thought, is anticipatory; and the justification, or proof of it, can only result from the detailed treatment of thought itself. For in philosophy, to prove means to show how the subject by and from itself makes itself what it is. The relation in which these three leading grades of thought, or of the logical Idea, stand to each other must be conceived as follows. Truth comes only with the notion; or, more precisely, the notion is the truth of being and essence, both of which, when separately maintained in their isolation, cannot but be untrue, the former because it is exclusively immediate, the latter because it is exclusively mediate. Why then, it may be asked, begin with false and not at once with the true. To which we answer that truth, to deserve the name, must authenticate its own truth: which authentication, here within the sphere of logic, is given, when the notion demonstrates itself to be what is mediated by and with itself, and thus at the same time to be truly immediate. This relation between the three stages of the logical Idea appears in a real and concrete shape thus: God, who is the truth, is known by us in His truth, that is, as absolute spirit, only in so far as we at the same time recognize that the world which He created, nature and the finite spirit, are, in their difference from God, untrue.

VII. Being

§ 84

BEING IS THE notion implicit only: its special forms have the predicate 'is'; when they are distinguished they are each of them an 'other': and the shape which dialectic takes in them, i.e. their further specialisation, is passing over into another. This further determination, or specialisation, is at once a forth-putting and in that way a disengaging of the notion implicit in being; and at the same time the withdrawing of being inwards, its sinking deeper into itself. Thus the explication of the notion in the sphere of being does two things: it brings out the totality of being, and it abolishes the immediacy of being, or the form of being as such.

§ 85

Being itself and the special sub-categories of it which follow, as well as those of logic in general, may be looked upon as definitions of the Absolute, or metaphysical definitions of God: at least the first and third category in every triad may — the first, where the thought-form of the triad is formulated in its simplicity, and the third, being the return from differentiation to a simple self-reference. For a metaphysical definition of God is the expression of his nature in thoughts as such: and logic embraces all thoughts so long as they continue in the thought-form. The second sub-category in each triad, where the grade of thought is in its differentiation, gives, on the other hand, a definition of the finite.

The objection to the form of definition is that it implies a something in the mind's eye on which these predicates may fasten. Thus even the

Absolute (though it purports to express God in the style and character of thought) in comparison with its predicate (which really and distinctly expresses in thought what the subject does not) is as yet only an inchoate pretended thought — the indeterminate subject of predicates yet to come. The thought, which is here the matter of sole importance, is contained only in the predicate: and hence the propositional form, like the said subject, viz., the Absolute, is a mere superfluity.

Quantity, Quality and Measure

Each of the three spheres of the logical idea proves to be a systematic whole of thought-terms, and a phase of the Absolute. This is the case with Being, containing the three grades of quality, quantity and measure.

Quality is, in the first place, the character identical with being: so identical that a thing ceases to be what it is, if it loses its quality. Quantity, on the contrary, is the character external to being, and does not affect the being at all. Thus, e.g. a house remains what it is, whether it be greater or smaller; and red remains red, whether it be brighter or darker.

Measure, the third grade of being, which is the unity of the first two, is a qualitative quantity. All things have their measure: i.e. the quantitative terms of their existence, their being so or so great, does not matter within certain limits; but when these limits are exceeded by an additional more or less, the things cease to be what they were. From measure follows the advance to the second subdivision of the idea, Essence.

The three forms of being here mentioned, just because they are the first, are also the poorest, i.e. the most abstract. Immediate (sensible) consciousness, in so far as it simultaneously includes an intellectual element, is especially restricted to the abstract categories of quality and quantity.

The sensuous consciousness is in ordinary estimation the most concrete and thus also the richest; but that is true only as regards materials, whereas,

in reference to the thought it contains, it is really the poorest and most abstract.

A. QUALITY

(a) Being

Pure Being

§ 86

Pure Being makes the beginning: because it is on the one hand pure thought, and on the other immediacy itself, simple and indeterminate; and the first beginning cannot be mediated by anything, or be further determined.

All doubts and admonitions, which might be brought against beginning the science with abstract empty being, will disappear if we only perceive what a beginning naturally implies. It is possible to define being as ‘I = I’, as ‘Absolute Indifference’ or Identity, and so on. Where it is felt necessary to begin either with what is absolutely certain, i.e. certainty of oneself, or with a definition or intuition of the absolute truth, these and other forms of the kind may be looked on as if they must be the first. But each of these forms contains a mediation, and hence cannot be the real first: for all mediation implies advance made from a first on to a second, and proceeding from something different. If I = I, or even the intellectual intuition, are really taken to mean no more than the first, they are in this mere immediacy identical with being: while conversely, pure being, if abstract no longer, but including in it mediation, is pure thought or intuition.

If we enunciate Being as a predicate of the Absolute, we get the first definition of the latter. The Absolute is Being. This is (in thought) the absolutely initial definition, the most abstract and stinted. It is the definition

given by the Eleatics, but at the same time is also the well-known definition of God as the sum of all realities. It means, in short, that we are to set aside that limitation which is in every reality, so that God shall be only the real in all reality, the superlatively real. Or, if we reject reality, as implying a reflection, we get a more immediate or unreflected statement of the same thing, when Jacobi says that the God of Spinoza is the *principium* of being in all existence.

(1) When thinking is to begin, we have nothing but thought in its merest indeterminateness: for we cannot determine unless there is both one and another: and in the beginning there is yet no other. The indeterminate, as we have it, is the blank we begin with, not a featurelessness reached by abstraction, not the elimination of all character, but the original featurelessness which precedes all definite character and is the very first of all. And this we call Being. It is not to be felt, or perceived by sense, or pictured in imagination: it is only and merely thought, and as such it forms the beginning. Essence also is indeterminate, but in another sense: it has traversed the process of mediation and contains implicit the determination it has absorbed.

(2) In the history of philosophy the different stages of the logical Idea assume the shape of successive systems, each based on a particular definition of the Absolute. As the logical Idea is seen to unfold itself in a process from the abstract to the concrete, so in the history of philosophy the earliest systems are the most abstract, and thus at the same time the poorest. The relation too of the earlier to the later systems of philosophy is much like the relation of the corresponding stages of the logical Idea: in other words, the earlier are preserved in the later: but subordinated and submerged. This is the true meaning of a much misunderstood phenomenon in the history of philosophy — the refutation of one system by another, of an earlier by a later. Most commonly the refutation is taken in a purely

negative sense to mean that the system refuted has ceased to count for anything, has been set aside and done for. Were it so, the history of philosophy would be, of all studies, most saddening, displaying, as it does, the refutation of every system which time has brought forth. Now although it may be admitted that every philosophy has been refuted, it must be in an equal degree maintained that no philosophy has been refuted, nay, or can be refuted. And that in two ways. For first, every philosophy that deserves the name always embodies the Idea: and secondly, every system represents one particular factor or particular stage in the evolution of the Idea. The refutation of a philosophy, therefore, only means that its barriers are crossed, and its special principle reduced to a factor in the completer principle that follows.

Thus the history of philosophy, in its true meaning, deals not with a past, but with an eternal and veritable present: and, in its results, resembles not a museum of the aberrations of the human intellect, but a Pantheon of godlike figures. These figures of gods are the various stages of the Idea, as they come forward one after another in dialectical development.

To the historian of philosophy it belongs to point out more precisely how far the gradual evolution of his theme coincides with, or swerves from, the dialectical unfolding of the pure logical Idea. It is sufficient to mention here, that logic begins where the proper history of philosophy begins. Philosophy began in the Eleatic school, especially with Parmenides. Parmenides, who conceives the absolute as Being, says that 'Being alone is and Nothing is not'. Such was the true starting-point of philosophy, which is always knowledge by thought: and here for the first time we find pure thought seized and made an object to itself.

Men indeed thought from the beginning (for thus only were they distinguished from the animals). But thousands of years had to elapse before they came to apprehend thought in its purity, and to see it in the truly

objective. The Eleatics are celebrated as daring thinkers. But this nominal admiration is often accompanied by the remark that they went too far, when they made Being alone true, and denied the truth of every other object of consciousness. We must go further than mere Being, it is true: and yet it is absurd to speak of the other contents of our consciousness as somewhat as it were outside and beside Being, or to say that there are other things, as well as Being. The true state of the case is rather as follows. Being, as Being, is nothing fixed or ultimate: it yields to dialectic and sinks into its opposite, which, also taken immediately, is Nothing. After all, the point is that Being is the pure Thought; whatever else you may begin with (the I = I, the absolute indifference, or God himself), you begin with a figure of materialised conception, not a product of thought; and that, so far as its thought-content is concerned, such beginning is merely Being.

Nothing

§ 87

But this mere Being, as it is mere abstraction, is therefore the absolutely negative: which, in a similarly immediate aspect, is just Nothing.

(1) Hence was derived the second definition of the Absolute: the Absolute is the Nought. In fact this definition is implied in saying that the thing-in-itself is the indeterminate, utterly without form and so without content — or in saying that God is only the supreme Being and nothing more; for this is really declaring him to be the same negativity as above. The Nothing which the Buddhists make the universal principle, as well as the final aim and goal of everything, is the same abstraction.

(2) If the opposition in thought is stated in this immediacy as Being and Nothing, the shock of its nullity is too great not to stimulate the attempt to fix Being and secure it against the transition into Nothing.

With this intent, reflection has recourse to the plan of discovering some fixed predicate for Being, to mark it off from Nothing. Thus we find Being identified with what persists amid all change, with *matter*, susceptible of innumerable determinations — or even, unreflectingly, with a single existence, any chance object of the senses or of the mind. But every additional and more concrete characterisation causes Being to lose that integrity and simplicity it has in the beginning. Only in, and by virtue of, this mere generality is it Nothing, something inexpressible, whereof the distinction from Nothing is a mere intention or *meaning*.

All that is wanted is to realise that these beginnings are nothing but these empty abstractions, one as empty as the other. The instinct that induces us to attach a settled import to Being, or to both, is the very necessity which leads to the onward movement of Being and Nothing, and gives them a true or concrete significance. This advance is the logical deduction and the movement of thought exhibited in the sequel. The reflection which finds a profounder connotation for Being and Nothing is nothing but logical thought, through which such connotation is evolved, not, however, in an accidental, but a necessary way.

Every signification, therefore, in which they afterwards appear, is only a more precise specification and truer definition of the Absolute. And when that is done, the mere abstract Being and Nothing are replaced by a concrete in which both these elements form an organic part. The supreme form of Nought as a separate principle would be Freedom: but Freedom is negativity in that stage, when it sinks self-absorbed to supreme intensity, and is itself an affirmation, and even absolute affirmation.

The distinction between Being and Nought is, in the first place, only implicit, and not yet actually made: they only *ought* to be distinguished. A distinction of course implies two things, and that one of them possesses an attribute which is not found in the other. Being however is an absolute

absence of attributes, and so is Nought. Hence the distinction between the two is only meant to be; it is a quite nominal distinction, which is at the same time no distinction. In all other cases of difference there is some common point which comprehends both things.

Suppose e.g. we speak of two different species: the genus forms a common ground between both. But in the case of mere Being and Nothing, distinction is without a bottom to stand upon: hence there can be no distinction, both determinations being the same bottomlessness. If it be replied that Being and Nothing are both of them thoughts, so that thought may be reckoned common ground, the objector forgets that Being is not a particular or definite thought, and hence, being quite indeterminate, is a thought not to be distinguished from Nothing. It is natural too for us to represent Being as absolute riches, and Nothing as absolute poverty. But if when we view the whole world we can only say that everything *is*, and nothing more, we are neglecting all speciality and, instead of absolute plenitude, we have absolute emptiness. The same stricture is applicable to those who define God to be mere Being; a definition not a whit better than that of the Buddhists, who make God to be Nought, and who from that principle draw the further conclusion that self-annihilation is the means by which man becomes God.

Becoming

§ 88

Nothing, if it be thus immediate and equal to itself, is also conversely the same as Being is. The truth of Being and of Nothing is accordingly the unity of the two: and this unity is Becoming.

(1) The proposition that Being and Nothing is the same seems so paradoxical to the imagination or understanding, that it is perhaps taken for

a joke. And indeed it is one of the hardest things thought expects itself to do: for Being and Nothing exhibit the fundamental contrast in all its immediacy — that is, without the one term being invested with any attribute which would involve its connection with the other. This attribute, however, as the above paragraph points out, is implicit in them — the attribute which is just the same in both. So far the deduction of their unity is completely analytical: indeed the whole progress of philosophising in every case, if it be a methodical, that is to say a necessary, progress, merely renders explicit what is implicit in a notion. It is as correct however to say that Being and Nothing are altogether different, as to assert their unity. The one is *not* what the other is. But since the distinction has not at this point assumed definite shape (Being and Nothing are still the immediate), it is, in the way that they have it, something unutterable, which we merely *mean*.

(2) No great expenditure of wit is needed to make fun of the maxim that Being and Nothing are the same, or rather to adduce absurdities which, it is erroneously asserted, are the consequences and illustrations of that maxim.

If Being and Nought are identical, say these objectors, it follows that it makes no difference whether my home, my property, the air I breathe, this city, the sun, the law, mind, God, are or are not. Now in some of these cases the objectors foist in private aims, the utility a thing has for me, and then ask, whether it be all the same to me if the thing exist and if it do not. For that matter indeed, the teaching of philosophy is precisely what frees man from the endless crowd of finite aims and intentions, by making him so insensible to them that their existence or non-existence is to him a matter of indifference. But it is never to be forgotten that, once mention something substantial, and you thereby create a connection with other existences and other purposes which are *ex hypothesi* worth having: and on such hypothesis it comes to depend whether the Being and not-Being of a

determinate subject are the same or not. A substantial distinction is in these cases secretly substituted for the empty distinction of Being and Nought.

In others of the cases referred to, it is virtually absolute existences and vital ideas and aims, which are placed under the mere category of Being or not-Being. But there is no more to be said of these concrete objects, than that they merely are or are not. Barren abstractions, like Being and Nothing — the initial categories which, for that reason, are the scantiest anywhere to be found — are utterly inadequate to the nature of these objects. Substantial truth is something far above these abstractions and their oppositions. And always when a concrete existence is disguised under the name of Being and not-Being, empty-headedness makes its usual mistake of speaking about, and having in mind an image of, something else than what is in question: and in this place the question is about abstract Being and Nothing.

(3) It may perhaps be said that nobody can form a notion of the unity of Being and Nought. As for that, the notion of the unity is stated in the section preceding, and that is all: apprehend that, and you have comprehended this unity. What the objector really means by comprehension — by a notion — is more than his language properly implies: he wants a richer and more complex state of mind, a pictorial conception which will propound the notion as a concrete case and one more familiar to the ordinary operations of thought. And so long as incomprehensibility means only the want of habituation for the effort needed to grasp an abstract thought, free from all sensuous admixture, and to seize a speculative truth, the reply to the criticism is that philosophical knowledge is undoubtedly distinct in kind from the mode of knowledge best known in common life, as well as from that which reigns in the other sciences. But if to have no notion merely means that we cannot represent in imagination the oneness of Being and Nought, the statement is far from being true; for everyone has countless ways of envisaging this unity. To say that we have no such conception can

only mean that in none of these images do we recognise the notion in question, and that we are not aware that they exemplify it. The readiest example of it is Becoming. Everyone has a mental idea of Becoming, and will even allow that it is *one* idea: he will further allow that, when it is analysed, it involves the attribute of Being, and also what is the very reverse of Being, viz. Nothing: and that these two attributes lie undivided in the one idea: so that Becoming is the unity of Being and Nothing. Another tolerably plain example is a Beginning. In its beginning, the thing is not yet, but it is more than merely nothing, for its Being is already in the beginning. Beginning is itself a case of Becoming; only the former term is employed with an eye to the further advance. If we were to adopt logic to the more usual method of the sciences, we might start with the representation of a Beginning as abstractly thought, or with Beginning as such, and then analyse this representation; and perhaps people would more readily admit, as a result of this analysis, that Being and Nothing present themselves as undivided in unity.

(4) It remains to note that such phrases as 'Being and Nothing are the same'., or 'The unity of Being and Nothing' — like all other such unities, that of subject and object, and others — give rise to reasonable objection. They misrepresent the facts, by giving an exclusive prominence to the unity, and leaving the difference which undoubtedly exists in it (because it is Being and Nothing, for example, the unity of which is declared) without any express mention or notice. It accordingly seems as if the diversity had been unduly put out of court and neglected. The fact is, no speculative principle can be correctly expressed by any such propositional form, for the unity has to be conceived *in* the diversity, which is all the while present and explicit.

'To become' is the true expression for the resultant of 'to be' and 'not to be'; it is the unity of the two; but not only is it the unity, it is also inherent

unrest — the unity, which is no mere reference-to-self and therefore without movement, but which, through the diversity of Being and Nothing that is in it, is at war within itself. Determinate Being, on the other hand, is this unity, or Becoming in this form of unity: hence all that ’is there and so’ is one-sided and finite. The opposition between the two factors seems to have vanished; it is only implied in the unity, it is not explicitly put in it.

(5) The maxim of Becoming, that Being is the passage into Nought, and Nought the passage into Being, is controverted by the maxim of Pantheism, the doctrine of the eternity of matter, that from nothing comes nothing, and that something can only come out of something. The ancients saw plainly that the maxim, ‘From nothing comes nothing, from something something’, really abolishes Becoming: for what it comes from and what it becomes are one and the same. Thus explained, the proposition is the maxim of abstract identity as upheld by the understanding. It cannot but seem strange, therefore, to hear such maxims as ‘Out of nothing comes nothing: Out of something comes something’ calmly taught in these days, without the teacher being in the least aware that they are the basis of Pantheism, and even without his knowing that the ancients have exhausted all that is to be said about them.

Becoming is the first concrete thought, and therefore the first notion: whereas Being and Nought are empty abstractions. The notion of Being, therefore, of which we sometimes speak, must mean Becoming; not the mere point of Being, which is empty Nothing, any more than Nothing, which is empty Being. In Being then we have Nothing, and in Nothing, Being; but this Being which does not lose itself in Nothing is Becoming. Nor must we omit the distinction, while we emphasise the unity of Becoming; without that distinction we should once more return to abstract Being. Becoming is only the explicit statement of what Being is in its truth.

We often hear it maintained that thought is opposed to being. Now in the face of such a statement, our first question ought to be, what is meant by being. If we understand being as it is defined by reflection, all that we can say of it is that it is what is wholly identical and affirmative. And if we then look at thought, it cannot escape us that thought also is at least what is absolutely identical with itself. Both therefore, being as well as thought, have the same attribute. This identity of being and thought is not however to be taken in a concrete sense, as if we could say that a stone, so far as it has being, is the same as a thinking man. A concrete thing is always very different from the abstract category as such. And in the case of being, we are speaking of nothing concrete: for being is the utterly abstract. So far then the question regarding the *being* of God — a being which is in itself concrete above all measure — is of slight importance.

As the first concrete thought-term, Becoming is the first adequate vehicle of truth. In the history of philosophy, this stage of the logical Idea finds its analogue in the system of Heraclitus.

When Heraclitus says 'All is flowing', he enunciates Becoming as the fundamental feature of all existence, whereas the Eleatics, as already remarked, saw only truth in Being, rigid processless Being. Glancing at the principle of the Eleatics, Heraclitus then goes on to say: Being no more is than not-Being; a statement expressing the negativity of abstract Being, and its identity with not-Being, as made explicit in Becoming; both abstractions being alike untenable. This may be looked at as an instance of the real refutation of one system by another. To refute a philosophy is to exhibit the dialectical movement in its principle, and thus reduce it to a constituent member of a higher concrete form of the Idea.

Even Becoming, however, taken at its best on its own ground, is an extremely poor term: it needs to grow in depth and weight of meaning. Such deepened force we find e.g. in Life. Life is a Becoming but that is not

enough to exhaust the notion of life. A still higher form is found in Mind. Here too is Becoming, but richer and more intensive than mere logical Becoming. The elements whose unity constitute mind are not the bare abstracts of Being and of Nought, but the system of the logical Idea and of Nature.

(b) Being Determinate

§ 89

In Becoming the Being which is one with Nothing, and the Nothing which is one with Being, are only vanishing factors; they are and they are not. Thus by its inherent contradiction Becoming collapses into the unity in which the two elements are absorbed. This result is accordingly Being Determinate (Being there and so).

In this first example we must call to mind, once for all, [that]: the only way to secure any growth and progress in knowledge is to hold results fast in their truth. There is absolutely nothing whatever in which we cannot and must not point to contradictions or opposite attributes; and the abstraction made by understanding therefore means a forcible insistence on a single aspect, and a real effort to obscure and remove all consciousness of the other attribute which is involved. Whenever such contradiction, then, is discovered in any object or notion, the usual inference is, *Hence* this object is *nothing*.

Thus Zeno, who first showed the contradiction native to motion, concluded that there is no motion; and the ancients, who recognised origin and decease, the two species of Becoming, as untrue categories, made use of the expression that the One or Absolute neither arises not perishes. Such a style of dialectic looks only at the negative aspect of its result, and fails to notice, what is at the same time really present, the definite result, in the

present case a pure nothing, but a Nothing which includes Being, and, in like manner, a Being which includes Nothing. Hence Being Determinate is (1) the unity of Being and Nothing, in which we get rid of the immediacy in these determinations, and their contradiction vanishes in their mutual connection — the unity in which they are only constituent elements. And (2) since the result is the abolition of the contradiction, it comes in the shape of a simple unity with itself: that is to say, it also is Being with negation or determinateness: it is Becoming expressly put in the form of one of its elements, viz., Being.

Even our ordinary conception of Becoming implies that somewhat comes out of it, and that Becoming therefore has a result. But this conception gives rise to the question, how Becoming does not remain mere Becoming, but has a result?

The answer to this question follows from what Becoming has already shown itself to be. Becoming always contains Being and Nothing in such a way, that these two are always changing into each other, and reciprocally cancelling each other. Thus Becoming stands before us in utter restlessness — unable however to maintain itself in this abstract restlessness: for, since Being and Nothing vanish in Becoming (and that is the very notion of Becoming), the latter must vanish also. Becoming is as it were a fire, which dies out in itself, when it consumes its material. The result of this process however is not empty Nothing, but Being identical with the negation — what we call Being Determinate (being then and there): the primary import of which evidently is that it *has become*.

Quality

§ 90

[a] Determinate Being is Being with a character or mode — which simply *is*; and such unmediated character is Quality. And as reflected into itself in this its character or mode, Determinate Being is a somewhat, as existent. The categories, which issue by a closer analysis of Determinate Being, need only be mentioned briefly.

Quality may be described as the determinate mode immediate and identical with Being — as distinguished from Quantity (to come afterwards), which, although a mode of Being, is no longer immediately identical with Being, but a mode indifferent and external to it. A something is what it is in virtue of its quality, and losing its quality it ceases to be what it is.

Quality, moreover, is completely a category only of the finite, and for that reason too it has its proper place in Nature, not in the world of the Mind. Thus, for example, in Nature what are styled elementary bodies, oxygen, nitrogen, etc., should be regarded as existing qualities. But in the sphere of mind, Quality appears in a subordinate way only, and not as if its qualitativeness could exhaust any specific aspect of mind. If, for example, we consider the subjective mind, which forms the object of psychology, we may describe what is called (moral and mental) character, as in logical language identical with Quality. This however does not mean that character is a mode of being which pervades the soul and is immediately identical with it, as is the case in the natural world with elementary bodies beforementioned. Yet a more distinct manifestation of Quality as such, in mind even, is found in the case of besotted or morbid conditions, especially in states of passion and when the passion rises to derangement. The state of mind of a deranged person, being one mass of jealousy, fear, etc., may suitably be described as Quality.

Reality, Being-for-another & Being-for-self

§ 91

Quality, as determinateness which *is*, as contrasted with the Negation which is involved in it but distinguished from it, is Reality. Negation is no longer an abstract nothing, but, as a determinate being and somewhat, is only a form of such being — it is as Otherness. Since this otherness, though a determination of Quality itself, is in the first instance distinct from it, Quality is Being-for-another — an expansion of the mere point of Determinate Being, or of Somewhat. The Being as such of Quality, contrasted with this reference to somewhat else, is Being-for-self.

The foundation of all determinateness is negation. The unreflecting observer supposes that determinate things are merely positive, and pins them down under the form of being. Mere being however is not the end of the matter: it is, as we have already seen, utter emptiness and instability besides. Still, when abstract being is confused in this way with being modified and determinate, it implies some perception of the fact that, though in determinate being there is involved an element of negation, this element is at first wrapped up, as it were, and only comes to the front and receives its due in Being-for-self. If we go on to consider determinate Being as a determinateness which *is*, we get in this way what is called Reality.

We speak, for example, of the reality of a plan or a purpose, meaning thereby that they are no longer inner and subjective, but have passed into being-there-and-then. In the same sense the body may be called the reality of the soul, and the law the reality of freedom, and the world altogether the reality of the divine idea. The word 'reality' is however used in another acceptation to mean that something behaves conformably to its essential characteristic or notion. For example, we use the expression: This is a real occupation; This is a real man. Here the term does not merely mean outward and immediate existence: but rather that some existence agrees with its notion. In which sense, be it added, reality is not distinct from the

ideality which we shall in the first instance become acquainted with in the shape of Being-for-self.

§ 92

[b] Being, if kept distinct and apart from its determinate mode, as it is in Being-by-self (Being implicit), would be only the vacant abstraction of Being. In Being (determinate there and then), the determinateness is one with Being; yet at the same time, when explicitly made a negation, it is a Limit, a Barrier. Hence the otherness is not something indifferent and outside it, but a function proper to it. Somewhat is by its quality, firstly finite, secondly alterable; so that finitude and variability appertain to its being.

In Being-there-and-then, the negation is still directly one with the Being, and this negation is what we call a Limit (Boundary). A thing is what it is, only in and by reason of its limit. We cannot therefore regard the limit as only external to being which is then and there. It rather goes through and through the whole of such existence. The view of limit, as merely an external characteristic of being-there-and-then, arises from a confusion of quantitative with qualitative limit. Here we are speaking primarily of the qualitative limit. If, for example, we observe a piece of ground, three acres large, that circumstance is its quantitative limit. But, in addition, the ground is, it may be, a meadow, not a wood or a pond. This is its qualitative limit. Man, if he wishes to be actual, must be-there-and-then, and to this end he must set a limit to himself. People who are too fastidious towards the finite never reach actuality, but linger lost in abstraction, and their light dies away.

If we take a closer look at what a limit implies, we see it involving a contradiction in itself, and thus evincing its dialectical nature. On the one side limit makes the reality of a thing; on the other it is its negation. But,

again, the limit, as the negation of something, is not an abstract nothing but a nothing which is — what we call an “other”. Given something, and up starts an other to us: we know that there is not something only, but an other as well. Nor, again, is the other of such a nature that we can think something apart from it; a something is implicitly the other of itself, and the somewhat sees its limit become objective to it in the other. If we now ask for the difference between something and another, it turns out that they are the same: which sameness is expressed in Latin by calling the pair *aliad-aliud*. The other, as opposed to the something, is itself a something, and hence we say some other, or something else; and so on the other hand the first something when opposed to the other, also defined as something, is itself an other. When we say “something else” our first impression is that something taken separately is only something, and that the quality of being another attaches to it only from outside considerations. Thus we suppose that the moon, being something else than the sun, might very well exist without the sun. But really the moon, as a something, has its other implicit in it. Plato says: God made the world out of the nature of the “one” and the “other” (ton eterou): having brought these together, he formed from them a third, which is of the nature of the “one” and the “other”. In these words we have in general terms a statement of the nature of the finite, which, as something, does not meet the nature of the other as if it had no affinity to it, but, being implicitly the other of itself, thus undergoes alteration. Alteration thus exhibits the inherent contradiction which originally attaches to determinate being, and which forces it out of its own bounds. To materialised conception existence stands in the character of something solely positive, and quietly abiding within its own limits: though we also know, it is true, that everything finite (such as existence) is subject to change. Such changeableness in existence is to the superficial eye a mere possibility, the realisation of which is not a consequence of its own nature.

But the fact is, mutability lies in the notion of existence, and change is only the manifestation of what it implicitly is. The living die, simply because as living they bear in themselves the germ of death.

§ 93

Something becomes an other; this other is itself somewhat; therefore it likewise becomes an other, and so on *ad infinitum*.

§ 94

This Infinity is the wrong or negative infinity: it is only a negation of a finite: but the finite rises again the same as ever, and is never got rid of and absorbed. In other words, this infinite only expresses the *ought-to-be* elimination of the finite. The progression to infinity never gets further than a statement of the contradiction involved in the finite, viz. that it is somewhat as well as somewhat else. It sets up with endless iteration the alternation between these two terms, each of which calls up the other.

If we let somewhat and another, the elements of determinate Being, fall asunder, the result is that some becomes other, and this other is itself a somewhat, which then as such changes likewise, and so on *ad infinitum.* This result seems to superficial reflection something very grand, the grandest possible. But such a progression to infinity is not the real infinite. That consists in being at home with itself in its other, or, if enunciated as a process, in coming to itself in its other. Much depends on rightly apprehending the notion of infinity, and not stopping short at the wrong infinity of endless progression. When time and space, for example, are spoken of as infinite, it is in the first place the infinite progression on which our thoughts fasten. We say, Now, This time, and then we keep continually going forwards and backwards beyond this limit. The case is the same with

space, the infinity of which has formed the theme of barren declamation to astronomers with a talent for edification. In the attempt to contemplate such an infinite, our thought, we are commonly informed, must sink exhausted. It is true indeed that we must abandon the unending contemplation, not however because the occupation is too sublime, but because it is too tedious. It is tedious to expatiate in the contemplation of this infinite progression, because the same thing is constantly recurring. We lay down a limit: then we pass it: next we have a limit once more, and so on for ever. All this is but superficial alternation, which never leaves the region of the finite behind. To suppose that by stepping out and away into that infinity we release ourselves from the finite, is in truth but to seek the release which comes by flight. But the man who flees is not yet free: in fleeing he is still conditioned by that from which he flees. If it be also said that the infinite is unattainable, the statement is true, but only because to the idea of infinity has been attached the circumstance of being simply and solely negative. With such empty and other-world stuff philosophy has nothing to do. What philosophy has to do with is always something concrete and in the highest sense present.

No doubt philosophy has also sometimes been set the task of finding an answer to the question, how the infinite comes to the resolution of issuing out of itself. This question, founded, as it is, upon the assumption of a rigid opposition between finite and infinite, may be answered by saying that the opposition is false, and that in point of fact the infinite eternally proceeds out of itself, and yet does not proceed out of itself. If we further say that the infinite is the not-finite, we have in point of fact virtually expressed the truth: for as the finite itself is the first negative, the not-finite is the negative of that negation, the negation which is identical with itself and thus at the same time a true affirmation.

The infinity of reflection here discussed is only an *attempt* to reach the true infinity, a wretched neither-one-thing-nor-another. Generally speaking, it is the point of view which has in recent times been emphasised in Germany. The finite, this theory tells us, *ought* to be absorbed; the infinite ought not to be a negative merely, but also a positive. That ‘ought to be’ betrays the incapacity of actually making good a claim which is at the same time recognised to be right. This stage was never passed by the systems of Kant and Fichte, so far as ethics are concerned. The utmost to which this way brings us is only the postulate of a never-ending approximation to the law of Reason: which postulate has been made an argument for the immortality of the soul.

§ 95

What we now in point of fact have before us, is that somewhat comes to be an other, and that the other generally comes to be an other. Thus essentially relative to another, somewhat is virtually an other against it: and since what is passed into is quite the same as what passes over, since both have one and the same attribute, viz. to be an other, it follows that something in its passage into other only joins with itself. To be thus self-related in the passage, and in the other, is the genuine Infinity. Or, under a negative aspect: what is altered is the other, it becomes the other of the other. Thus Being, but as negation of the negation, is restored again: it is now Being-for-self.

Dualism, in putting an insuperable opposition between finite and infinite, fails to note the simple circumstance that the infinite is thereby only one of two, and is reduced to a particular, to which the finite forms the other particular. Such an infinite, which is only a particular, is conterminous with the finite which makes for it a limit and a barrier: it is not what it ought to be, that is, the infinite, but is only finite. In such circumstances, where the

finite is on this side, and the infinite on that-this world as the finite and the other world as the infinite-an equal dignity of permanence and independence is ascribed to finite and to infinite. The being of the finite is made an absolute being, and by this dualism gets independence and stability. Touched, so to speak, by the infinite, it would be annihilated. But it must not be touched by the infinite. There must be an abyss, an impassable gulf between the two, with the infinite abiding on yonder side and the finite steadfast on this. Those who attribute to the finite this inflexible persistence in comparison with the infinite are not, as they imagine, far above metaphysic: they are still on the level of the most ordinary metaphysic of understanding. For the same thing occurs here as in the infinite progression. At one time it is admitted that the finite has no independent actuality, no absolute being, no root and development of its own, but is only a transient. But next moment this is straightway forgotten; the finite, made a mere counterpart to the infinite, wholly separated from it, and rescued from annihilation, is conceived to be persistent in its independence. While thought thus imagines itself elevated to the infinite, it meets with the opposite fate: it comes to an infinite which is only a finite, and the finite, which it had left behind, has always to be retained and made into an absolute.

After this examination (with which it were well to compare — Plato's *Philebus*), tending to show the nullity of the distinction made by understanding between the finite and the infinite, we are liable to glide into the statement that the infinite and the finite are therefore one, and that the genuine infinity, the truth, must be defined and enunciated as the unity of the finite and infinite. Such a statement would be to some extent correct; but is just as open to perversion and falsehood as the unity of Being and Nothing already noticed. Besides it may very fairly be charged with reducing the infinite to finitude and making a finite infinite. For, so far as

the expression goes, the finite seems left in its place-it is not expressly stated to be absorbed. Or, if we reflect that the finite, when identified with the infinite, certainly cannot remain what it was out of such unity, and will at least suffer some change in its characteristics (as an alkali, when combined with an acid, loses some of its properties), we must see that the same fate awaits the infinite, which, as the negative, will on its part likewise have its edge, as it were, taken off on the other. And this does really happen with the abstract one-sided infinite of understanding. The genuine infinite however is not merely in the position of the one-sided acid, and so does not lose itself. The negation of negation is not a neutralisation: the infinite is the affirmative, and it is only the finite which is absorbed.

In Being-for-self enters the category of Ideality. Being-there-and-then, as in the first instance apprehended in its being or affirmation, has reality (§ 91); and thus even finitude in the first instance is in the category of reality. But the truth of the finite is rather its ideality. Similarly, the infinite of understanding, which is coordinated with the finite, is itself only one of two finites, no whole truth, but a non-substantial element. This ideality of the finite is the chief maxim of philosophy; and for that reason every genuine philosophy is idealism. But everything depends upon not taking for the infinite what, in the very terms of its characterisation, is at the same time made a particular and finite. For this, reason we have bestowed a greater amount of attention on this distinction. The fundamental notion of philosophy, the genuine infinite, depends upon it. The distinction is cleared up by the simple, and for that reason seemingly insignificant, but incontrovertible reflections contained in the first paragraph of this section.

(c) Being-for-self

§ 96

[a] Being-for-self, as reference to itself, is immediacy, and as reference of the negative to itself, is a self-subsistent, the One. This unit, being without distinction in itself, thus excludes the other from itself.

To be for self — to be one — is completed Quality, and as such, contains abstract Being and Being modified as non-substantial elements. As simple Being, the One is simple self-reference; as Being modified it is determinate: but the determinateness is not in this case a finite determinateness — a somewhat in distinction from an other — but infinite, because it contains distinction absorbed and annulled in itself.

The readiest instance of Being-for-self is found in the 'I'. We know ourselves as existents, distinguished in the first place from other existents, and with certain relations thereto. But we also come to know this expansion of existence (in these relations) reduced, as it were, to a point in the simple form of being-for-self. When we say 'I', we express this reference-to-self which is infinite, and at the same time negative. Man, it may be said, is distinguished from the animal world, and in that way from our nature altogether, by knowing himself as 'I': which amounts to saying that natural things never attain free Being-for-self, but as limited to Being-there-and-then, are always and only Being for another.

Again, Being-for-self may be described as ideality, just as Being-there-and-then was described as reality. It is said that besides reality there is *also* an ideality. Thus the two categories are made equal and parallel. Properly speaking, ideality is not somewhat outside of and beside reality: the notion of ideality just lies in its being the truth of reality. That is to say, when reality is explicitly put as what it implicitly is, it is at once seen to be ideality. Hence ideality has not received its proper estimation, when you allow that reality is not all in all, but that an ideality must be recognised outside of it. Such an ideality, external to or it may even be beyond reality, would be no better than an empty name. Ideality only has a meaning when

it is the ideality of something: but this something is not a mere indefinite this or that, but existence characterised as reality, which, if retained in isolation, possesses no truth. The distinction between Nature and Mind is not improperly conceived, when the former is traced back to reality, and the latter so fixed and complete as to subsist even without Mind: in Mind it first, as it were, attains its goal and its truth. And similarly, Mind on its part is not merely a world beyond Nature and nothing more: it is really, and with full proof, seen to be mind, only when it involves Nature as absorbed in itself. Apropos of this, we should note the double meaning of the German word *aufheben* (to put by or set aside). We mean by it (1) to clear away, or annul: thus, we say, a law or regulation is set aside; (2) to keep, or preserve: in which sense we use it when we say: something is well put by. This double usage of language, which gives to the same word a positive and negative meaning, is not an accident, and gives no ground for reproaching language as a cause of confusion. We should rather recognise in it the speculative spirit of our language rising above the mere 'either-or' of understanding.

§ 97

[b] The relation of the negative to itself is a negative relation, and so a distinguishing of the One from itself, the repulsion of the One; that is, it makes Many Ones. So far as regards the immediacy of the self-existents, these Many *are*: and the repulsion of every One of them becomes to that extent their repulsion against each other as existing units — in other words, their reciprocal exclusion.

Whenever we speak of the One, the Many usually come into our mind at the same time. Whence, then, we are forced to ask, do the Many come? This question is unanswerable by the consciousness which pictures the Many as a primary datum, and treats the One as only one among the Many. But the

philosophic notion teaches, contrariwise, that the One forms the presupposition of the Many: and in the thought of the One is implied that it explicitly make itself Many. The self-existing unit is not, like Being, void of all connective reference: it is a reference, as well as Being-there-and-then was, not however a reference connecting somewhat with an other, but as unity of some and the other, it is a connection with itself, and this connection, be it noted, is a negative connection. Hereby the One manifests an utter incompatibility with itself, a self-repulsion: and what makes itself explicitly be, is the Many. We may denote this side in the process of Being-for-self by the figurative term Repulsion. Repulsion is a term originally employed in the study of matter, to mean that matter, as a Many, in each of these many ones, behaves as exclusive to all the others. It would be wrong however to view the process of repulsion as if the One were the repellent and the Many the repelled. The One, as already remarked, just is self-exclusion and explicit putting itself as the Many. Each of the Many however is itself a One, and in virtue of its so behaving, this all rounded repulsion is by one stroke converted into its opposite — Attraction.

Attraction and Repulsion

§ 98

But the Many are one the same as another: each is One, or even one of the Many; they are consequently one and the same. Or when we study all that Repulsion involves, we see that as a negative attitude of many Ones to one another, it is just as essentially a connective reference of them to each other; and as those to which the One is related in its act of repulsion are ones, it is in them thrown into relation with itself. The repulsion therefore has an equal right to be called Attraction; and the exclusive One, or Being-for-self, suppresses itself. The qualitative character, which in the One or unit has

reached the extreme point of its characterisation, has thus passed over into determinateness (quality) suppressed, i.e. into Being as Quantity.

The philosophy of the Atomists is the doctrine in which the Absolute is formulated as Being-for-self, as One, and many ones. And it is the repulsion, which shows itself in the notion of the One, which is assumed as the fundamental force in these atoms. But instead of attraction, it is Accident, that is, mere unintelligence, which is expected to bring them together. So long as the One is fixed as one, it is certainly impossible to regard its congression with others as anything but external and mechanical. The Void, which is assumed as the complementary principle to the atoms, is repulsion and nothing else, presented under the image of the nothing existing between the atoms. Modern Atomism — and physics is still in principle atomistic — has surrendered the atoms so far as to pin its faith on molecules or particles. In doing so, science has come closer to sensuous conception, at the cost of losing the precision of thought. To put an attractive by the side of a repulsive force, as the moderns have done, certainly gives completeness to the contrast: and the discovery of this natural force, as it is called, has been a source of much pride. But the mutual implication of the two, which makes what is true and concrete in them, would have to be wrested from the obscurity and confusion in which they were left even in Kant's Metaphysical Rudiments of Natural Science. In modern times the importance of the atomic theory is even more evident in political than in physical science. According to it, the will of individuals as such is the creative principle of the State: the attracting force is the special wants and inclinations of individuals; and the Universal, or the State itself, is the external nexus of a compact.

(1) The Atomic philosophy forms a vital stage in the historical evolution of the Idea. The principle of that system may be described as Being-for-itself in the shape of the Many. At present, students of nature who are

anxious to avoid metaphysics turn a favourable ear to Atomism. But it is not possible to escape metaphysics and cease to trace nature back to terms of thought, by throwing ourselves into the arms of Atomism. The atom, in fact, is itself a thought; and hence the theory which holds matter to consist of atoms is a metaphysical theory.

Newton gave physics an express warning to beware of metaphysics, it is true, but to his honour be it said, he did not by any means obey his own warning. The only mere physicists are the animals: they alone do not think: while man is a thinking being and a born metaphysician. The real question is not whether we shall apply metaphysics, but whether our metaphysics are of the right kind: in other words, whether we are not, instead of the concrete logical Idea, adopting one-sided forms of thought, rigidly fixed by understanding, and making these the basis of our theoretical as well as our practical work. It is on this ground that one objects to the Atomic philosophy.

The old Atomists viewed the world as a many, as their successors often do to this day. On chance they laid the task of collecting the atoms which float about in the void. But, after all, the nexus binding the many with one another is by no means a mere accident: as we have already remarked, the nexus founded on their very nature.

To Kant we owe the completed theory of matter as the unity of repulsion and attraction. The theory is correct, so far as it recognises attraction to be the other of the two elements involved in the notion of being-for-self: and to be an element no less essential than repulsion to constitute matter. Still, this dynamic construction of matter, as it is termed, has the fault of taking for granted, instead of deducing, attraction and repulsion. Had they been deduced, we should then have seen the How and Why of a unity which is merely asserted. Kant ... [insisted that] matter must be regarded as consisting solely in their unity.

German physicists for some time accepted this pure dynamic. But in spite of this, the majority of these physicists in modern times have found it more convenient to return to the Atomic point of view, and in spite of the warnings of Kästner, one of their number, have begun to regard Matter as consisting of infinitesimally small particles, termed ‘atoms which atoms have then to be brought into relation with one another by the play of forces attaching to them-attractive, repulsive, or whatever they may be. This too is metaphysics; and metaphysics which, for its utter unintelligence, there would be sufficient reason to guard against.

Quantity and Quality

(2) The transition from Quality to Quantity, indicated in the paragraph before us, is not found in our ordinary way of thinking, which deems each of these categories to exist independently beside the other. We are in the habit of saying that things are not merely qualitatively, but also quantitatively defined; but whence these categories originate, and how they are related to each other, are questions not further examined. The fact is, quantity just means quality superseded and absorbed: and it is by the dialectic of quality here examined that this supersession is effected.

First of all, we had Being: as the truth of Being, came Becoming: which formed the passage into Being Determinate: and the truth of that we found to be Alteration. And in its result Alteration showed itself to be Being-for-self, finally, in the two sides of the process, Repulsion and Attraction, was clearly seen to annul itself, and thereby to annul quality in the totality of its stages.

Still this superseded and absorbed quality is neither an abstract nothing, nor an equally abstract and featureless being: it is only being as indifferent to determinateness or character. This aspect of being is also what appears as

quantity in our ordinary conceptions. We observe things, first of all, with an eye to their quality — which we take to be the character identical with the being of the thing. If we proceed to consider their quantity, we get the conception of an indifferent and external character or mode, of such a kind that a thing remains what it is, though its quantity is altered, and the thing becomes greater or less.

B. QUANTITY

C. MEASURE

§ 107

Measure is the qualitative quantum, in the first place as immediate — a quantum, to which a determinate being or a quality is attached.

Measure, where quality and quantity are in one, is thus the completion of Being. Being, as we first apprehend it, is something utterly abstract and characterless; but it is the very essence of Being to characterise itself, and its complete characterisation is reached in Measure. Measure, like the other stages of Being, may serve as a definition of the Absolute; God, it has been said, is the Measure of all things. It is this idea which forms the ground-note of many of the ancient Hebrew hymns, in which the glorification of God tends in the main to show that he has appointed to everything its bound: to the sea and the solid land, to the rivers and mountains; and also to the various kinds of plants and animals. To the religious sense of the Greeks the divinity of measure, especially in respect of social ethics, was represented by Nemesis. That conception implies a general theory that all human beings, riches, honour, and power, as well as joy and pain, have their definite measure, the transgression of which brings ruin and destruction. In the world of objects too, we have measure. We see, in the first place, existences in Nature, of which measure forms the essential structure. This is

the case, for example, with the solar system, which may be described as the realm of free measures. As we next proceed to the study of inorganic nature, measure retires, as it were, into the background; at least we often find the quantitative and qualitative characteristics showing indifference to each other. Thus the quality of a rock or a river is not tied to a definite magnitude.

But even these objects when closely inspected are found to be not quite measureless: the water of a river, and the single constituents of a rock, when chemically analysed, are seen to be qualities conditioned by the quantitative ratios between the matters they contain. In organic nature, however, measure again rises into immediate perception. The various kinds of plants and animals, in the whole as well as in their parts, have a certain measure: though it is worth noticing that the more imperfect forms, those which are least removed from inorganic nature, are partly distinguished from the higher forms by the greater indefiniteness of their measure. Thus among fossils we find some ammonites discernible only by the microscope and others as large as a cart-wheel. The same vagueness of measure appears in several plants, which stand on a low level of organic development — for instance ferns.

§ 108

In so far as in Measure quality and quantity are only in *immediate* unity, to that extent their difference presents itself in a manner equally immediate. Two cases are then possible. Either the specific quantum or measure is a bare quantum, and the definite being (there-and-then) is capable of an increase or a diminution, without Measure (which to that extent is a Rule) being thereby set completely aside. Or the alteration of the quantum is also an alteration of the quality.

The identity between quantity and quality, which is found in Measure, is at first only implicit, and not yet explicitly realised. In other words, these two categories, which unite in Measure, each claim an independent authority. On the one hand, the quantitative features of existence may be altered, without affecting its quality. On the other hand, this increase and diminution, immaterial though it be, has its limit, by exceeding which the quality suffers change. Thus the temperature of water is, in the first place, a point of no consequence in respect of its liquidity: still with the increase of diminution of the temperature of the liquid water, there comes a point where this state of cohesion suffers a qualitative change, and the water is converted into steam or ice. A quantitative change takes place, apparently without any further significance: but there is something lurking behind, and a seemingly innocent change of quantity acts as a kind of snare, to catch hold of the quality. The antinomy of Measure which this implies was exemplified under more than one garb among the Greeks. It was asked, for example, whether a single grain makes a heap of wheat, or whether it makes a bald-tail to tear out a single hair from the horse's tail. At first, no doubt, looking at the nature of quantity as an indifferent and external character of being, we are disposed to answer these questions in the negative. And yet, as we must admit, this indifferent increase and diminution has its limit: a point is finally reached, where a single additional grain makes a heap of wheat; and the bald-tail is produced, if we continue plucking out single hairs. These examples find a parallel in the story of the peasant who, as his ass trudged cheerfully along, went on adding ounce after ounce to its load, till at length it sunk under the unendurable burden. It would be a mistake to treat these examples as pedantic futility; they really turn on thoughts, an acquaintance with which is of great importance in practical life, especially in ethics. Thus in the matter of expenditure, there is a certain latitude within which a more or less does not matter; but when the Measure, imposed by

the individual circumstances of the special case, is exceeded on the one side or the other, the qualitative nature of Measure (as in the above examples of the different temperature of water) makes itself felt, and a course, which a moment before was held good economy, turns into avarice or prodigality. The same principles may be applied in politics, when the constitution of a state has to be looked at as independent of, no less than as dependent on, the extent of its territory, the number of its inhabitants, and other quantitative points of the same kind. If we look, e.g. at a state with a territory of ten thousand square miles and a population of four millions we should, without hesitation, admit that a few square miles of land or a few thousand inhabitants more or less could exercise no essential influence on the character of its constitution. But on the other hand, we must not forget that by the continual increase or diminishing of a state, we finally get to a point where, apart from all other circumstances, this quantitative alteration alone necessarily draws with it an alteration in the quality of the constitution. The constitution of a little Swiss canton does not suit a great kingdom; and, similarly, the constitution of the Roman republic was unsuitable when transferred to the small imperial towns of Germany.

§ 109

In this case, when a measure through its quantitative nature has gone in excess of its qualitative character, we meet what is at first an absence of measure, the Measureless. But seeing that the second quantitative ratio, which in comparison with the first is measureless, is none the less qualitative, the measureless is also a measure. These two transitions, from quality to quantum, and from the latter back again to quality, may be represented under the image of an infinite progression — as the self-abrogation and restoration of measure in the measureless.

Quantity, as we have seen, is not only capable of alteration, i.e. of increase or diminution: it is naturally and necessarily a tendency to exceed itself. This tendency is maintained even in measure. But if the quantity present in measure exceeds a certain limit, the quality corresponding to it is also put in abeyance. This however is not a negation of quality altogether, but only of this definite quality, the place of which is at once occupied by another. This process of measure, which appears alternately as a mere change in quantity, and then as a sudden revulsion of quantity into quality, may be envisaged under the figure of a nodal (knotted) line. Such lines we find in Nature under a variety of forms. We have already referred to the qualitatively different states of aggregation water exhibits under increase or diminution of temperature. The same phenomenon is presented by the different degrees in the oxidation of metals. Even the difference of musical notes may be regarded as an example of what takes place in the process of measure the revulsion from what is at first merely quantitative into qualitative alteration.

§ 110

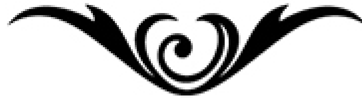
What really takes place here is that the immediacy, which still attaches to measure as such, is set aside. In measure, at first, quality and quantity itself are immediate, and measure is only their ‘relative’ identity. But measure shows itself absorbed and superseded in the measureless: yet the measureless, although it be the negation of measure, is itself a unity of quantity and quality. Thus in the measureless the measure is still seen to meet only with itself.

§ 111

Instead of the more abstract factors, Being and Nothing, some and other, etc., the Infinite, which is affirmation as a negation of negation, now finds

its factors in quality and quantity. These (a) have in the first place passed over quality into quantity (§ 98), and quantity into quality (§ 105), and thus are both shown up as negations. (b) But in their unity, that is, in measure, they are originally distinct, and the one is only through the instrumentality of the other. And (g) after the immediacy of this unity has turned out to be self-annulling, the unity is explicitly put as what it implicitly is, simple relation-to-self, which contains in it being and all its forms absorbed. Being or immediacy, which by the negation of itself is a mediation with self and a reference to self — which consequently is also a mediation which cancels itself into reference to self, or immediacy — is Essence.

The process of measure, instead of being only the wrong infinite of an endless progression, in the shape of an ever-recurrent recoil from quality to quantity and from quantity to quality, is also a true infinity of coincidence with self in other. In measure, quality and quantity originally confront each other, like some and other. But quality is implicitly quantity and conversely quantity is implicitly quality. In the process of measure, therefore, these two pass into each other: each of them becomes what it already was implicitly: and thus we get Being thrown into abeyance and absorbed, with its several characteristics negatived. Such Being is Essence. Measure is implicitly Essence; and its process consists in realising what it is implicitly. The ordinary consciousness conceives things as being, and studies them in quality, quantity, and measure. These immediate characteristics, however, soon show themselves to be not fixed but transient; and Essence is the result of their dialectic.



In the sphere of Essence one category does not pass into another, but refers to another merely. In Being, the form of reference is purely due to our reflection on what takes place: but it is the special and proper characteristic of Essence. In the sphere of Being, when somewhat becomes another, the somewhat has vanished. Not so in Essence: here there is no real other, but

only diversity, reference of the one to *its* other. The transition of Essence is therefore at the same time no transition: for in the passage of different into different, the different does not vanish: the different terms remain in their relation. When we speak of Being and Nought, Being is independent, so is Nought. The case is otherwise with the Positive and the Negative. No doubt these possess the characteristic of Being and Nought. But the Positive by itself has no sense; it is wholly in reference to the negative. And it is the same with the negative.

In the sphere of Being the reference of one term to another is only implicit; in Essence on the contrary it is explicit. And this in general is the distinction between the forms of Being and Essence: in Being everything is immediate, in Essence everything is relative.

VIII. Essence

§ 112

THE TERMS IN Essence are always mere pairs of correlatives, and yet not absolutely reflected in themselves: hence in essence the actual unity of the notion is not yet realised, but only postulated by reflection. Essence – which is Being coming into mediation with itself through the negativity of itself – is self-relatedness, only in so far as it is relation to an Other – this Other, however, coming to view at first not as something which *is*, but as postulated and hypothesised.

Being has not vanished: but, firstly, Essence, as simple self-relation, is Being, and secondly as regards its one-sided characteristic of immediacy, Being is deposed to a mere negative, to a seeming or reflected light – Essence accordingly is Being thus reflecting light into itself.

The Absolute is the Essence. This is the same definition as the previous one that the Absolute is Being, in so far as Being likewise is simple self-relation. But it is at the same time higher, because Essence is Being that has gone into itself: that is to say, the simple self-relation (in Being) is expressly put as *negation of the negative* is immanent self-mediation. Unfortunately, when the Absolute is defined to be Essence, the negativity which this implies is often taken only to mean the withdrawal of all determinate predicates. This negative action of withdrawal or abstraction thus falls outside of the Essence – which is thus left as a mere result apart from its premises – the *caput mortuum* of abstraction. But as this negativity, instead of being external to Being, is its own dialectic, the truth of the latter, viz., Essence, will be Being as retired within itself – immanent Being.

That reflection, or light thrown into itself, constitutes the distinction between Essence and immediate Being, and is the peculiar characteristic of Essence itself.

Any mention of Essence implies that we distinguish it from Being: the latter is immediate, and, compared with the Essence, we look upon it as mere seeming. But this seeming is not an utter nonentity and nothing at all, but Being superseded and put by. The point of view given by the Essence is, in general, the standpoint of 'Reflection'. This word 'reflection' is originally applied, when a ray of light in a straight line impinging upon the surface of a mirror is thrown back from it. In this phenomenon, we have two things – first an immediate fact which is, and secondly the deputed, derivated, or transmitted phase of the same. Something of this sort takes place when we reflect, or think upon an object: for here we want to know the object, not in its immediacy, but as derivative or mediated. The problem or aim of philosophy is often represented as the ascertainment of the essence of things: a phrase which only means that things, instead of being left in their immediacy, must be shown to be mediated by, or based upon, something else. The immediate Being of things is thus conceived under the image of a rind or curtain behind which the Essence is hidden.

Everything, it is said, has an Essence; that is, things really are not what they immediately show themselves. There is something more to be done than merely rove from one quality to another, and merely to advance from qualitative to quantitative, and vice versa: there is a permanence in things, and that permanence is in the first instance their Essence.

With respect to other meanings and uses of the category of Essence, we may note that in the German auxiliary verb, *sein* (to be), the past tense is expressed by the term for Essence *(wesen*): we designate past being as

gewesen. This anomaly of language implies to some extent a correct perception of the relation between Being and Essence. Essence we may certainly regard as past Being, remembering however meanwhile that the past is not utterly denied, but only laid aside and thus at the same time preserved.

Thus, to say, Caesar *was* in Gaul, only denies the immediacy of the event, but not his sojourn in Gaul altogether. That sojourn is just what forms the import of the proposition, in which however it is represented as over and gone. *Wesen* in ordinary life frequently means only a collection or aggregate: *Zeitungswesen* (the Press), *Postwesen* (the Post Office), *Steuerwesen* (the Revenue). All that these terms mean is that the things in question are not to be taken single, in their immediacy, but as a complex, and then, perhaps, in addition, in their various bearings. This usage of the term is not very different in its implications from our own.

People also speak of finite Essences, such as man. But the very term Essence implies that we have made a step beyond finitude: and the title as applied to man is so far inexact. It is often added that there is a supreme Essence (Being): by which is meant God. On this two remarks may be made. In the first place the phrase ‘there is’ suggests a finite only: as when we say there are so many planets, or there are plants of such a constitution and plants of such another. In these cases we are speaking of something which has other things beyond and beside it. But God, the absolutely infinite, is not something outside and beside whom there are other essences. All else outside God, if separated from him, possesses no essentiality: in its isolation it becomes a mere show or seeming, without stay or essence of its own. But, secondly, it is a poor way of talking to call God the *highest* or supreme Essence. The category of quantity which the phrase employs has its proper place within the compass of the finite. When we call one mountain the highest on the earth, we have a vision of other high mountains

beside it. So too when we call any one the richest or most learned in his country. But God, far from being a Being, even the highest, is *the* Being. This definition, however, though such a representation of God is an important and necessary stage in the growth of the religious consciousness, does not by any means exhaust the depth of the ordinary Christian idea of God. If we consider God as the Essence only, and nothing more, we know Him only as the universal and irresistible Power; in other words, as the Lord. Now the fear of the Lord is, doubtless, the beginning, but *only* the beginning, of wisdom. To look at God in this light, as the Lord, and the Lord alone, is especially characteristic of Judaism and also of Mohammedanism. The defect of these religions lies in their scant recognition of the finite, which, be it as natural things or as finite phases of mind, it is characteristic of the heathen and (as they also for that reason are) polytheistic religions to maintain intact. Another not uncommon assertion is that God, as the supreme Being, cannot be known. Such is the view taken by modern 'enlightenment' and abstract understanding, which is content to say *Il y a un être supréme:* and there lets the matter rest. To speak thus, and treat God merely as the supreme other-world Being, implies that we look upon the world before us in its immediacy as something permanent and positive, and forget that true Being is just the superseding of all that is immediate. If God be the abstract supersensible Being, outside whom therefore lies all difference and all specific character, he is only a bare name, a mere *caput mortuum* of abstracting understanding. The true knowledge of God begins when we know that things, as they immediately are, have no truth.

In reference also to other subjects besides God the category of Essence is often liable to an abstract use, by which, in the study of anything, its Essence is held to be something unaffected by, and subsisting in independence of, its definite phenomenal embodiment. Thus we say, for

example, of people, that the great thing is not what they do or how they behave, but what they are. This is correct, if it means that a man's conduct should be looked at, not in its immediacy, but only as it is explained by his inner self, and as a relevation of that inner self. Still it should be remembered that the only means by which the Essence and the inner self can be verified is their appearance in outward reality; whereas the appeal which men make to the essential life, as distinct from the material facts of conduct, is generally prompted by a desire to assert their own subjectivity and to elude an absolute and objective judgment.

§ 113
Identity

Self-relation in Essence is the form of Identity or of reflection-into-self, which has here taken the place of the immediacy of Being. They are both the same abstraction – self-relation.

The unintelligence of sense, to take everything limited and finite for Being, passes into the obstinacy of understanding, which views the finite as self-identical, not inherently self-contradictory.

The Unessential

§ 114

This identity, as it descended from Being, appears in the first place only charged with the characteristics of Being, and referred to Being as to something external. This external Being, if taken in separation from the true Being (of Essence), is called the Unessential. But that turns out to be a mistake. Because Essence is Being-in-self, it is essential only to the extent that it has in itself its negative, i.e. reference to another, or mediation. Consequently, it has the unessential as its own proper seeming (reflection)

in itself. But in seeming or mediation there is distinction involved: and since what is distinguished (as distinguished from identity out of which it arises, and in which it is not, or lies as seeming) receives itself the form of identity, the semblance is still not in the mode of Being, or of self-related immediacy.

The sphere of Essence thus turns out to be a still imperfect combination of immediacy and mediation. In it every term is expressly invested with the character of self-relatedness, while yet at the same time one is forced beyond it. It has Being – reflected being, a being in which another shows, and which shows in another. And so it is also the sphere in which the contradiction, still implicit in the sphere of Being, is made explicit.

As this one notion is the common principle underlying all logic, there appear in the development of Essence the same attributes or terms as in the development of Being, but in reflex form. Instead of Being and Nought we have now the forms of Positive and Negative; the former at first as Identity corresponding to pure and uncontrasted Being, the latter developed (showing in itself) as Difference. So also, we have Being represented by the Ground of determinate Being: which shows itself, when reflected upon the Ground, as Existence.

The theory of Essence is the most difficult branch of Logic. It includes the categories of metaphysic and of the sciences in general. These are the products of reflective understanding, which, while it assumes the differences to possess a footing of their own, and at the same time also expressly affirms their relativity, still combines the two statements, side by side, or one after the other, by an ‘also’, without bringing these thoughts into one, or unifying them into the notion.

The Development of Reflection
Ground – Existence – The Thing

A. ESSENCE AS GROUND OF EXISTENCE

(a) The pure principle or categories of Reflection

[a] Identity

§ 115

The Essence lights up in itself or is mere reflection: and therefore is only self-relation, not as immediate but as reflected. And that reflex relation is self-identity.

This identity becomes an Identity, in form only, or of the understanding, if it be held hard and fast, quite aloof from difference. Or, rather, abstraction is the imposition of this Identity of form, the transformation of something inherently concrete into this form of elementary simplicity. And this may be done in two ways. Either we may neglect a part of the multiple features which are found in the concrete thing (by what is called analysis) and select only one of them; or, neglecting their variety, we may concentrate the multiple character into one.

If we associate Identity with the Absolute, making the Absolute the subject of a proposition, we get: The Absolute is what is identical with itself. However, true this proposition may be, it is doubtful whether it be meant in its truth: and therefore it is at least imperfect in the expression. For it is left undecided, whether it means the abstract Identity of understanding-abstract. that is, because contrasted with the other characteristics of Essence – or the Identity which is inherently concrete. In the latter case, as will be seen, true identity is first discoverable in the Ground, and, with a higher truth, in the Notion. Even the word Absolute is often used to mean more than ‘abstract’. Absolute space and absolute time, for example, is another way of saying abstract space and abstract time.

When the principles of Essence are taken as essential principles of thought they become predicates of a presupposed subject, which, because they are essential, is ‘everything’. The propositions thus arising have been stated as universal Laws of Thought. Thus the first of them, the maxim of Identity, reads: Everything is identical with itself, A = A: and negatively, A cannot at the same time be A and Not-A. This maxim, instead of being a true law of thought, is nothing but the law of abstract understanding. The propositional form itself contradicts it: for a proposition always promises a distinction between subject and predicate; while the present one does not fulfil what its form requires. But the Law is particularly set aside by the following so-called Laws of Thought, which make laws out of its opposite. It is asserted that the maxim of Identity, though it cannot be proved, regulates the procedure of every consciousness, and that experience shows it to be accepted as soon as its terms are apprehended. To this alleged experience of the logic books may be opposed the universal experience that no mind thinks or forms conceptions or speaks in accordance with this law, and that no existence of any kind whatever conforms to it.

Utterances after the fashion of this pretended law (A planet is a planet; Magnetism is magnetism; Mind is Mind) are, as they deserve to be, reputed silly. That is certainly a matter of general experience. The logic which seriously propounds such laws and the scholastic world in which alone they are valid have long been discredited with practical common sense as well as with the philosophy of reason.

Identity is, in the first place, the repetition of what we had earlier as Being, but as *become*, through supersession of its character of immediateness. It is therefore Being as Ideality. It is important to come to a proper understanding on the true meaning of Identity; and, for that purpose, we must especially guard against taking it as abstract identity, to the exclusion of all Difference. That is the touchstone for distinguishing all bad

philosophy from what alone deserves the name of philosophy. Identity in its truth, as an Ideality of what immediately is, is a high category for our religious modes of mind as well as all other forms of thought and mental activity. The true knowledge of God, it may be said, begins when we know him as identity – as absolute identity. To know so much is to see all the power and glory of the world sinks into nothing in God's presence, and subsists only as the reflection of his power and his glory. In the same way, Identity, as self-consciousness, is what distinguishes man from nature, particularly from the brutes which never reach the point of comprehending themselves as 'I'; that is, pure self-contained unity. So again, in connection with thought, the main thing is not to confuse the true Identity, which contains Being and its characteristics ideally transfigured in it, with an abstract Identity, identity of bare form. All the charges of narrowness, hardness, meaninglessness, which are so often directed against thought from the quarter of feeling and immediate perception rest on the perverse assumption that thought acts only as a faculty of abstract Identification.

The Formal Logic itself confirms this assumption by laying down the supreme law of thought (so-called) which has been discussed above. If thinking were no more than an abstract Identity, we could not but own it to be a most futile and tedious business. No doubt the notion, and the idea too, are identical with themselves: but identical only in so far as they at the same time involve distinction.

[b] Difference

§ 116

Essence is mere Identity and reflection in itself only as it is self-relating negativity, and in that way self-repulsion. It contains therefore essentially the characteristic of Difference.

Other-being is here no longer qualitative, taking the shape of the character or limit. It is now in essence, in self-relating essence, and therefore the negation is at the same time a relation – is, in short, Distinction, Relativity, Mediation.

To ask 'How Identity comes to Difference' assumes that Identity as mere abstract Identity is something of itself, and Difference also something else equally independent. This supposition renders an answer to the question impossible. If Identity is viewed as diverse from Difference, all that we have in this way is but Difference; and hence we cannot demonstrate the advance to difference, because the person who asks for the How of the progress thereby implies that for him the starting-point is non-existent. The question then when put to the test has obviously no meaning, and its proposer may be met with the question what he means by Identity; whereupon we should soon see that he attaches no idea to it at all, and that Identity is for him an empty name. As we have seen, besides, Identity is undoubtedly a negative – not however an abstract empty Nought, but the negation of Being and its characteristics. Being so, Identity is at the same time self-relation, and, what is more, negative self-relation; in other words, it draws a distinction between it and itself.

Diversity

§ 117

Difference is first of all (1) immediate difference, i.e. Diversity or Variety. In Diversity the different things are each individually what they are, and unaffected by the relation in which they stand to each other. This relation is therefore external to them. In consequence of the various things being thus indifferent to the difference between them, it falls outside them into a third

thing, the agent of Comparison. This external difference, as an identity of the objects related, is Likeness; as a non-identity of them, is Unlikeness.

The gap which understanding allows to divide these characteristics is so great that although comparison has one and the same substratum for likeness and unlikeness, which are explained to be different aspects and points of view in it, still likeness by itself is the first of the elements alone, viz., identity, and unlikeness by itself is difference.

Diversity has, like Identity, been transformed into a maxim: 'Everything is various or different': or 'There are no two things completely like each other'. Here Everything is put under a predicate, which is the reverse of the identity attributed to it in the first maxim: and therefore under a law contradicting the first. However, there is an explanation. As the diversity is supposed due only to external circumstances, anything taken *per se* is expected and understood always to be identical with itself, so that the second law need not interfere with the first. But, in that case, variety does not belong to the something or everything in question: it constitutes no intrinsic characteristic of the subject: and the second maxim on this showing does not admit of being stated at all. If, on the other hand, the something itself is, as the maxim says, diverse, it must be in virtue of its own proper character: but in this case the specific difference, and not variety as such, is what is intended. And this is the meaning of the maxim of Leibnitz.

When understanding sets itself to study Identity, it has already passed beyond it, and is looking at Difference in the shape of bare Variety. If we follow the so-called law of Identity, and say, The sea is the sea, The air is the air, The moon is the moon, these objects pass for having no bearing on one another. What we have before us therefore is not Identity, but Difference. We do not stop at this point, however, or regard things merely as different. We compare them one with another, and then discover the

features of likeness and unlikeness. The work of the finite sciences lies to a great extent in the application of these categories, and the phrase ‘scientific treatment’ generally means no more than the method which has for its aim comparison of the objects under examination. This method has undoubtedly led to some important results; we may particularly mention the great advance of modern times in the provinces of comparative anatomy and comparative linguistics. But it is going too far to suppose that the comparative method can be employed with equal success in all branches of knowledge. Nor – and this must be emphasised – can mere comparison ever ultimately satisfy the requirements of science. Its results are indeed indispensable, but they are still labours only preliminary to truly intelligent cognition.

If it be the office of comparison to reduce existing differences to Identity, the science which most perfectly fulfils that end is mathematics. The reason of that is that quantitative difference is only the difference which is quite external. Thus, in geometry, a triangle and a quadrangle, figures qualitatively different, have this qualitative difference discounted by abstraction, and are equalised to one another in magnitude. It follows from what has been said formerly about mere Identity of understanding that, as has also been pointed out (s. 99), neither philosophy nor the empirical sciences need envy this superiority of Mathematics.

The story is told that when Leibnitz propounded the maxim of Variety, the cavaliers and ladies of the court, as they walked round the garden, made efforts to discover two leaves indistinguishable from each other, in order to confute the law stated by the philosopher. Their device was unquestionably a convenient method of dealing with metaphysics – one which has not ceased to be fashionable. All the same, as regards the principle of Leibnitz, difference must be understood to mean not an external and indifferent

diversity merely, but difference essential. Hence the very nature of things implies that they must be different.

Likeness and Unlikeness

§ 118

Likeness is an identity only of those things which are not the same, not identical with each other: and Unlikeness is a relation of things alike. The two therefore do not fall on different aspects or points of view in the thing, without any mutual affinity, but one throws light into the other. Variety thus comes to be reflexive difference or difference (distinction) implicit and essential, determinate or specific difference.

Difference and identity in natural science

While things merely various show themselves unaffected by each other, likeness and unlikeness on the contrary are a pair of characteristics which are in completely reciprocal relation. This advance from simple variety to opposition appears in our common acts of thought when we allow that comparison has a meaning only upon the hypothesis of an existing difference, and that on the other hand we can distinguish only on the hypothesis of existing similarity. Hence, if the problem be the discovery of a difference, we attribute no great cleverness to the man who only distinguishes those objects, of which the difference is palpable, e.g. a pen and a camel: and similarly it implies no very advanced faculty of comparison when the objects compared, e.g. a beech and an oak, a temple and a church, are near akin. In the case of difference, in short, we like to see identity, and in the case of identity, we like to see difference. Within the range of empirical sciences, however, the one of these two categories is often allowed to put the other out of sight and mind.

Thus the scientific problem at one time is to reduce existing differences to identity; on another occasion, with equal one-sidedness, to discover new differences. We see this especially in physical science. There the problem consists, in the first place, in the continual search for new ‘elements’, new forces, new genera and species. Or, in another direction, it seeks to show that all bodies hitherto thought to be simple are compound: and modern physicists and chemists smile at the ancients, who were satisfied with four elements, and these not simple. Secondly, and on the other hand, mere identity is made the chief question. Thus electricity and chemical affinity are regarded as the same, and even the organic processes of digestion and assimilation are looked upon as a mere chemical operation. Modern philosophy has often been nicknamed the Philosophy of Identity. But, as was already remarked (s. 103, note) it is precisely philosophy, and in particular speculative logic, which lays bare the nothingness of the abstract, undifferentiated identity, known to understanding: though it also undoubtedly urges its disciples not to rest at mere diversity, but to ascertain the inner of all existence.

§ 119

Difference implicit is essential difference, the Positive and the negative: and that is this way. The Positive is the identical self-relation in such a way as not to be the Negative, and the Negative is the different by itself so as not to be the Positive. Thus either has an existence of its own in proportion as it is not the other. The one is made visible in the other, and is only in so far as that other is. Essential difference is therefore Opposition; according to which the different is not confronted by *any* other but by *its* other. That is, either of these two (Positive and Negative) is stamped with a characteristic of its own only in its relation to the other: the one is only reflected into itself

as it is reflected into the other. And so with the other. Either in this way is the other's *own* other.

Difference implicit or essential gives the maxim, Everything is essentially distinct; or, as it has also been expressed, Of two opposite predicates the one only can be assigned to anything, and there is no third possible. This maxim of Contrast or Opposition most expressly controverts the maxim of identity: the one says a thing should be only self-relation, the other says it must be an opposite, a relation to its other. The native unintelligence of abstraction betrays itself by setting in juxtaposition two contrary maxims, like these, as laws, without even so much as comparing them. The Maxim of Excluded Middle is the maxim of the definite understanding, which would fain avoid contradiction, but in so doing falls into it. A must be either +A or -A, it says. It virtually declares in these words a third A which is neither + nor -, and which at the same time is yet invested with + and - characters.

If + W mean 6 miles to the West, and -W mean 6 miles to the East, and if the + and - cancel each other, the 6 miles of way or space remain what they were with and without the contrast. Even the mere *plus and minus* of number or abstract direction have, if we like, zero, for their third: but it need not be denied that the empty contrast, which understanding institutes between plus *and minus,* is not without its value in such abstractions as number, direction, &c.

In the doctrine of contradictory concepts, the one notion is, say, blue (for in this doctrine even the sensuous generalised image of a colour is called a notion) and the other not-blue. This other then would not be an affirmative, say, yellow, but would merely be kept at the abstract negative. That the Negative in its own nature is quite as much Positive (see next §), is implied in saying that what is opposite to another is *its* other. The inanity of the opposition between what are called contradictory notions is fully exhibited

in what we may call the grandiose formula of a general law, that Everything has the one and not the other of all predicates which are in such opposition. In this way, mind is either white or not-white, yellow or not-yellow, etc., *ad infinitum.*

It was forgotten that Identity and Opposition are themselves opposed, and the maxim of Opposition was taken even for that of Identity, in the shape of the principle of Contradiction. A notion, which possesses neither or both of two mutually contradictory marks, e.g. a quadrangular circle, is held to be logically false. Now though a multiangular circle and a rectilinear arc no less contradict this maxim, geometers never hesitate to treat the circle as a polygon with rectilineal sides. But anything like a circle (that is to say its mere character or nominal definition) is still no notion. In the notion of a circle, centre and circumference are equally essential; both marks belong to it; and yet centre and circumference are opposite and contradictory to each other.

The conception of Polarity, which is so dominant in Physics, contains by implication the more correct definition of Opposition. But physics for its theory of the laws of thought adheres to the ordinary logic; it might therefore well be horrified in case it should ever work out the conception of Polarity, and get at the thoughts which are implied in it.

(1) With the positive we return to identity, but in its higher truth as identical self-relation, and at the same time with the note that it is not the negative. The negative *per se* is the same as difference itself. The identical as such is primarily the yet uncharacterised: the positive on the other hand is what is self-identical, but with the mark of antithesis to an other. And the negative is difference as such, characterised as not identity. This is the difference of difference within its own self.

Positive and negative are supposed to express an absolute difference. The two however are at bottom the same: the name of either might be

transferred to the other. Thus, for example, debts and assets are not two particular, self-subsisting species of property. What is negative to the debtor is positive to the creditor. A way to the east is also a way to the west. Positive and negative are therefore intrinsically conditioned by one another, and are only in relation to each other. The north pole of the magnet cannot be without the south pole, and vice versa. If we cut a magnet in two, we have not a north pole in one piece, and a south pole in the other. Similar, in electricity, the positive and the negative are not two diverse and independent fluids. In opposition, the different is not confronted by an other, but by its other.

Usually we regard different things as unaffected by each other. Thus we say: I am a human being, and around me are air, water, animals, and all sorts of things. Everything is thus put outside of every other. But the aim of philosophy is to banish indifference, and to ascertain the necessity of things. By that means the other is seen to stand over against *its* other. Thus, for example, inorganic nature is not to be considered merely something else than organic nature, but the necessary antithesis of it. Both are in essential relation to one another; and the one of the two is, only in so far as it excludes the other from it, and thus relates itself thereto. Nature in like manner is not without mind, nor mind without nature. An important step has been taken, when we cease in thinking to use phrases like: Of course something else is also possible. While we speak, we are still tainted with contingency: and all true thinking, we have already said, is a thinking of necessity.

In modern physical science the opposition, first observed to exist in magnetism as polarity, has come to be regarded as a universal law pervading the whole of nature. This would be a real scientific advance, if care were at the same time taken not to let mere variety revert without explanation, as a valid category, side by side with opposition. Thus at one

time the colours are regarded as in polar opposition to one another, and called complementary colours: at another time they are looked at in their indifferent and merely quantitative difference of red, yellow, green, etc.

(2) Instead of speaking by the maxim of Excluded Middle (which is the maxim of abstract understanding) we should rather say: Everything is opposite. Neither in heaven nor in Earth, neither in the world of mind nor of nature, is there anywhere such an abstract 'either-or' as the understanding maintains. Whatever exists is concrete, with difference and opposition in itself. The finitude of things will then lie in the want of correspondence between their immediate being, and what they essentially are. Thus, in inorganic nature, the acid is implicitly at the same time the base: in other words, its only being consists in its relation to its other. Hence also the acid is not something that persists quietly in the contrast: it is always in effort to realise what it potentially is.

Contradiction is the very moving principle of the world: and it is ridiculous to say that contradiction is unthinkable. The only thing correct in that statement is that contradiction is not the end of the matter, but cancels itself. But contradiction, when cancelled, does not leave abstract identity; for that is itself only one side of the contrariety. The proximate result of opposition (when realised as contradiction) is the Ground, which contains identity as well as difference superseded and deposited to elements in the completer notion.

§ 120

Contrariety then has two forms. The Positive is the aforesaid various (different) which is understood to be independent, and yet at the same time not to be unaffected by its relation to its other. The Negative is to be, no less independently, negative self-relating, self-subsistent, and yet at the same time as Negative must on every point have this its self-relation, i.e. its

Positive, only in the other. Both Positive and Negative are therefore explicit contradiction; both are potentially the same. Both are so actually also; since either is the abrogation of the other and of itself. Thus they fall to the Ground. Or as is plain, the essential difference, as a difference, is only the difference of it from itself, and thus contains the identical: so that to essential and actual difference there belongs itself as well as identity. As self-relating difference it is likewise virtually enunciated as the self-identical. And the opposite is in general that which includes the one and its other, itself and its opposite. The immanence of essence thus defined is the Ground.

The Ground

§ 121

The Ground is the unity of identity and difference, the truth of what difference and identity have turned out to be – the reflection-into-self, which is equally a reflection-into-other, and vice-versa. It is essence put explicitly as a totality.

The maxim of Ground runs thus: Everything has its Sufficient Ground: that is, the true essentiality of any thing is not the predication of it as identical with itself, or as different (various), or merely positive, or merely negative, but as having its Being in an other, which, being the self-same, is its essence. And to this extent the essence is not abstract reflection into self, but into an other. The Ground is the essence in its own inwardness; the essence is intrinsically a ground; and it is a ground only when it is a ground of somewhat, of an other.

We must be careful, when we say that the ground is the unity of identity and difference, not to understand by this unity an abstract identity. Otherwise we only change the name, while we still think the identity (of

understanding) already seen to be false. To avoid this misconception we may say that the ground, besides being the unity, is also the difference of identity and difference. In that case in the ground, which promised at first to supersede contradiction, a new contradiction seems to arise. It is however, a contradiction, which, so far from persisting quietly in itself, is rather the expulsion of it from itself. The ground is a ground only to the extent that it affords ground: but the result which thus issued from the ground is only itself. In this lies its formalism. The ground and what is grounded are one and the same content: the difference between the two is the mere difference of form which separates simple self-relation, one the one hand, from mediation, or derivativeness on the other. Inquiry into the grounds of things goes with the point of view which, as already noted (§ 112n), is adopted by Reflection. We wish, as it were, to see the matter double, first in its immediacy, and secondly in its ground, where it is no longer immediate. This is the plain meaning of the Law of Sufficient Ground is that things should essentially be viewed as mediated. The manner in which Formal Logic establishes this law sets a bad example to other sciences. Formal Logic asks these sciences not to accept their subject-matter as it is immediately given; and yet herself lays down a law of thought without deducing it – in other words, without exhibiting its mediation. With the same justice as the logician maintains our faculty of thought to be so constituted that we must ask for the ground of everything, might the physicist, when asked why a man who falls into water is drowned, reply that man happens to be so constituted that he cannot live under water; or the jurist, when asked why a criminal is punished, reply that civil society happens to be so constituted that crimes cannot be left unpunished.

Yet even if logic be excused the duty of giving a ground for the law of sufficient ground, it might at least explain what is to be understood by a ground. The common explanation, which describes the ground as what has

a consequence, seems at first glance more lucid and intelligible than the preceding definition in logical terms. If you ask however what the consequence is, you are told that it is what has a ground; and it becomes obvious that the explanation is intelligible only because it assumes what in our case has been reached as the termination of an antecedent movement of thought. And this is the true business of logic: to show that those thoughts, which as usually employed merely float before consciousness neither understood nor demonstrated, are really grades in the self-determination of thought. It is by no means that they are understood and demonstrated.

In common life, and it is the same in the finite sciences, this reflective form is often employed as a key to the secret of the real condition of the objects of investigation. So long as we deal with what may be termed the household needs of knowledge, nothing can be urged against this method of study. But it can never afford definitive satisfaction, either in theory or practice. And the reason why it fails is that the ground is yet without a definite content of its own; so that to regard anything as resting upon a ground merely gives the formal difference of mediation in place of immediacy. We see an electrical phenomenon, for example, and we ask for its ground (or reason): we are told that electricity is the ground of this phenomenon. What is this but the same content as we had immediately before us, only translated into the form of inwardness?

The ground however is not merely simple self-identity, but also different: hence various grounds may be alleged for the same sum of fact. This variety of grounds, again, following the logic of difference, culminates in opposition of grounds *pro* and *contra*. In any action, such as a theft, there is a sum of fact in which several aspects may be distinguished. The theft has violated the rights of property: it has given the means of satisfying his wants to the needy thief: possibly too the man, from whom the theft was made, misused his property. The violation of property is unquestionably the

decisive point of view before which the others must give way: but the bare law of the ground cannot settle that question. Usually indeed the law is interpreted to speak of a sufficient ground, not of any ground whatever: and it might be supposed therefore, in the action referred to, that, although other points of view besides the violation of property might be held as grounds, yet they would not be sufficient grounds. But here comes a dilemma. If we use the phrase 'sufficient ground', the epithet is either otiose, or of such a kind as to carry us past the mere category of ground. The predicate is otiose and tautological, if it only states the capability of giving a ground or reason: for the ground is a ground, only in so far as it has this capability. If a soldier runs away from battle to save his life, his conduct is certainly a violation of duty; but it cannot be held that the ground which led him so to act was insufficient, otherwise he would have remained at his post. Besides, there is this also to be said. On one hand any ground suffices: on the other no ground suffices as mere ground; because, as already said, it is yet void of a content objectively and intrinsically determined, and is therefore not self-acting and productive.

A content thus objectively and intrinsically determined, and hence self-acting, will hereafter come before us as the notion: and it is the notion which Leibnitz had in his eye when he spoke of sufficient ground, and urged the study of things under its point of view. His remarks were originally directed against that merely mechanical method of conceiving things so much in vogue even now; a method which he justly pronounces insufficient. We may see an instance of this mechanical theory of investigation when the organic process of the circulation of the blood is traced back merely to the contraction of the heart; or when certain theories of criminal law explain the purpose of punishment to lie in deterring people from crime, in rendering the criminal harmless, or in other extraneous grounds of the same kind. It is unfair to Leibnitz to suppose that he was

content with anything so poor as this formal law of the ground. The method of investigation which he inaugurated is the very reverse of a formalism which acquiesces in mere grounds, where a full and concrete knowledge is sought. Considerations to this effect led Leibnitz to contrast *causae efficientes* and *causae finales*, and to insist on the place of final causes as the conception to which the efficient were to lead up . If we adopt this distinction, light, heat, and moisture would be the *causae efficientes*, not *causa finalis* of the growth of plants; the *cause finalis* is the notion of the plant itself.

To get no further than mere grounds, especially on questions of law and morality, is the position and principle of the Sophists. Sophistry, as we ordinarily conceive it, is a method of investigation which aims at distorting what is just and true, and exhibiting things in a false light. Such however is not the proper or primary tendency of Sophistry: the standpoint of which is no other than that of *raisonnement.* The Sophists came on the scene at a time when the Greeks had begun to grow dissatisfied with mere authority and tradition and felt the need of intellectual justification for what they were to accept as obligatory. That desideratum the Sophists supplied by teaching their countrymen to seek for the various points of view under which things may be considered: which points of view are the same as grounds. But the ground, as we have seen, has no essential and objective principles of its own, and it is as easy to discover grounds for what is wrong and immoral as for what is moral and right. Upon the observer therefore it depends to decide what points are to have most weight. The decision in such circumstances is prompted by his individual views and sentiments. Thus the objective foundation of what ought to have been of absolute and essential obligation, accepted by all, was undermined: and Sophistry by this destructive action deservedly brought upon itself the bad name previously mentioned. Socrates, as we all know, met the Sophists at every point, not by

a bare reassertion of authority and tradition against their argumentations, but by showing dialectically how untenable the mere grounds were, and by vindicating the obligations of justice and goodness by reinstating the universal or notion of the will. In the present day such a method of argumentation is not quite out of fashion. Nor is that the case only in the discussion of secular matters. It occurs even in sermons, such as those where every possible ground of gratitude to God is propounded. To such pleading Socrates and Plato would not have scrupled to apply the name of Sophistry. For Sophistry has nothing to do with what is taught: that may very possibly be true. Sophistry lies in the formal circumstance of teaching it by grounds which are as available for attack as for defence. In a time so rich in reflection and so devoted to *raisonnement* as our own, he must be a poor creature who cannot advance a good ground for everything, even for what is worst and most depraved. Everything in the world that has become corrupt has had good ground for its corruption. An appeal to grounds at first makes the hearer think of beating a retreat: but when experience has taught him the real state of these matters, he closes his ears against them, and refuses to be imposed upon any more.

Existence

§ 122

As it first comes, the chief feature of Essence is show in itself and intermediation in itself. But when it has completed the circle of intermediation, its unity with itself is explicitly put as the self-annulling of difference, and therefore of intermediation. Once more then we come back to immediacy or Being – but Being in so far as it is intermediated by annulling the intermediation. And that Being is Existence.

The ground is not yet determined by objective principles of its own, nor is it an end or final cause: hence it is not active, not productive. An Existence only *proceeds from* the ground. The determinate ground is therefore a formal matter: that is to say, any point will do, so long as it is expressly put as self-relation, as affirmation, in correlation with the immediate existence depending on it. If it be a ground at all, it is a good ground: for the term 'good' is employed abstractly as equivalent to affirmative; and any point (or feature) is good which can in any way be enunciated as confessedly affirmative. So it happens that a ground can be found and adduced for everything: and a good ground (for example, a good motive for action) may effect something or may not, it may have a consequence or it may not. It becomes a motive (Strictly so called) and effects something, e.g. through its reception into a will; there and there only it becomes active and is made a cause.

(b) Existence

§ 123

Existence is the immediate unity of reflection-into-self and reflection-into-other. It follows from this that existence is the indefinite multitude of existents as reflected-into-themselves, which at the same time equally throw light upon one another – which, in short, are co-relative, and form a world of reciprocal dependence and of infinite interconnection between grounds and consequents. The grounds are themselves existences: and the existents in like manner are in many directions grounds as well as consequents.

The phrase 'Existence' (derived from *existere*) suggests the fact of having proceeded from something. Existence is Being which has proceeded from the ground, and has reinstated by annulling its intermediation. The Essence, as Being set aside and absorbed, originally came before us as

shining or showing in self, and the categories of this reflection are identity, difference and ground. The last is the unity of identity and difference; and because it unifies them it has at the same time to distinguish itself from itself. But that which is in this way distinguished from the ground is as little mere difference as the ground itself is abstract sameness. The ground works its own suspension: and when suspended, the result of its negation is existence. Having issued from the ground, existence contains the ground in it; the ground does not remain, as it were, behind existence, but by its very nature supersedes itself and translates itself into existence.

This is exemplified even in our ordinary mode of thinking when we look upon the ground of a thing, not as something abstractly inward, but as itself also an existent. For example, the lightning-flash which has set a house on fire would be considered the ground of the conflagration; or the manners of a nation and the conditions of its life would be regarded as the ground of its constitution. Such indeed is the ordinary aspect in which the existence world originally appears to reflection – an indefinite crowd of things existent, which being simultaneously reflected on themselves and on one another are related reciprocally as ground and consequence. In this motley play of the world, if we may so call the sum of existents, there is nowhere a firm footing to be found: everything bears an aspect of relativity, conditioned by and conditioning something else. The reflective understanding makes it its business to elicit and trace these connections running out in every direction: but the question touching an ultimate design is so far left unanswered, and therefore the craving of the reason after knowledge passes with the further development of the logical Idea beyond this position of mere relativity.

Thing-in-itself

§ 124

The reflection-on-another of the existent is however inseparable from reflection-into-self: the ground is their unity, from which existence has issued. The existent therefore includes relativity, and has on its own part its multiple interconnections with other existents: it is reflected on itself as its ground. The existent is, when so described, a Thing.

The 'thing-in-itself' (or thing in the abstract), so famous in the philosophy of Kant, shows itself here in its genesis. It is seen to be the abstract reflection-on-self, which is so clung to, to the exclusion of reflection-into-other-things and of all predication of difference.

The thing-in-itself therefore is the empty substratum for these predicates of relation.

If to know means to comprehend an object in its concrete character, then the thing-in-itself, which is nothing but the quite abstract and indeterminate thing in general, must certainly be as unknowable as it is alleged to be. With as much reason however as we speak of the thing-in-itself, we might speak of quality-by-itself or quantity-by-itself, and of any other category. The expression would then serve to signify that these categories are taken in their abstract immediacy, apart from their development and inward character. It is no better than a whim of the understanding, therefore, if we attach the qualificatory 'in-itself'' to the *thing* only. But this 'in-itself' is also applied to the facts of the mental as well as the natural world: as we speak of electricity or of a plant in itself, so we speak of man or the state in-itself.

By this 'in-itself' in these objects, we are meant to understand what they strictly and properly are. This usage is liable to the same criticism as the phrase 'thing-in-itself'. For if we stick to the mere 'in-itself' of an object, we apprehend it not in its truth, but in the inadequate form of mere abstraction. Thus the man, in himself, is the child. And what the child has to do is to rise out of this abstract and undeveloped 'in-himself' and become

‘for himself’ what he is at first only ‘in-himself’ – a free and reasonable being. Similarly, the state-in-itself is the yet immature and patriarchal state, where the various political functions, latent in the notion of the state, have not received the full logical constitution which the logic of political principles demands.

In the same sense, the germ may be called the plant-in-itself. These examples may show the mistake of supposing that the ‘thing-in-itself’ of things is something inaccessible to our cognition. All things are originally in-themselves, but that is not the end of the matter. As the germ, being the plant-in-itself, means self-development, so the thing in general passes beyond its in-itself (the abstract reflection on self) to manifest itself further as a reflection on other things. It is this sense that it has properties.

(c) The Thing

Properties

§ 125

[a] The Thing is the totality-the development in explicit unity of the categories of the ground and of existence. On the side of one of its factors, viz. reflection-on-other-things, it has in it the differences, in virtue of which it is a characterised and concrete thing. These characteristics are different from one another; they have their reflection-into-self not on their own part, but on the part of the thing. They are Properties of the thing: and their relation to the thing is expressed by the word ‘have’.

As a term of relation, ‘to have’ takes the place of ‘to be’. True, somewhat has qualities on its part too: but this transference of ‘having’ into the sphere of Being is inexact, because the character as quality is directly one with the somewhat, and the somewhat ceases to be when it loses its quality. But the thing is reflection-into-self: for it is an identity which is also

distinct from the difference, i.e. from its attributes. In many languages 'have' is employed to denote past time. And with reason: for the past is absorbed, or suspended being, and the mind is its reflection-into-self; in the mind only it continues to subsist-the mind, however, distinguishing from itself this being in it which has been absorbed or suspended.

In the Thing all the characteristics of reflection recur as existent. Thus the thing, in its initial aspect, as the thing-by-itself, is the selfsame or identical. But identity, it was proved, is not found without difference: so the properties, which the thing has, are the existent difference in the form of diversity. In the case of diversity of variety each diverse member exhibited an indifference to every other, and they had no other relation to each other, save what was given by a comparison external to them. But now in the thing we have a bond which keeps the various properties in union. Property, besides, should not be confused with quality. No doubt, we also say, a thing has qualities. But the phraseology is a misplaced one: 'having' hints at an independence, foreign to the 'somewhat', which is still directly identical with its quality. Somewhat is what it is only by its quality: whereas, though the thing indeed exists only as it has its properties, it is not confined to this or that definite property, and can therefore lose it, without ceasing to be what it is.

Matters

§ 126

[b] Even in the ground, however, the reflection-on-something-else is directly convertible with reflection-on-self. And hence the properties are not merely different from each other; they are also self-identical, independent, and relieved from their attachment to the thing. Still, as they are the characters of the thing distinguished from one another (as reflected-into-

self), they are not themselves things, if things be concrete; but only existences reflected into themselves as abstract characters. They are what are called Matters.

Nor is the name ‘things’ given to Matters, such as magnetic and electric matters. They are qualities proper, a reflected Being-One with their Being-they are the character that has reached immediacy, existence: they are ‘entities’.

To elevate the properties, which the Thing has, to the independent position of matters, or materials of which it consists, is a proceeding based upon the notion of a Thing: and for that reason is also found in experience. Thought and experience however alike protest against concluding from the fact that certain properties of a thing, such as colour, or smell, may be represented as particular colouring or odorific matters, that we are then at the end of the inquiry, and that nothing more is needed to penetrate to the true secret of things than a disintegration of them into their component materials. This disintegration into independent matters is properly restricted to inorganic nature only. The chemist is in the right, therefore, when, for example, he analyses common salt or gypsum into its elements, and finds that the former consists of muriatic acid and soda, the latter of sulphuric acid and calcium. So too the geologist does well to regard granite as a compound of quartz, felspar, and mica. These matters, again, of which the thing consists, are themselves partly things, which in that way may be once more reduced to more abstract matters. Sulphuric acid, for example, is a compound of sulphur and oxygen. Such matters or bodies can as a matter of fact be exhibited as subsisting by themselves: but frequently we find other properties of things, entirely wanting this self-subsistence, also regarded as particular matters. Thus we hear caloric, and electrical or magnetic matters spoken of. Such matters are at the best figments of understanding. And we see here the usual procedure of the abstract reflection of understanding.

Capriciously adopting single categories, whose value entirely depends on their place in the gradual evolution of the logical idea, it employs them in the pretended interests of explanation, but in the face of plain, unprejudiced perception and experience, so as to trace back to them every object investigated. Nor is this all. The theory, which makes things consist of independent matters, is frequently applied in a region where it has neither meaning nor force. For within the limits of nature even, wherever there is organic life, this category is obviously inadequate. An animal may be said to consist of bones, muscles, nerves, etc.: but evidently we are here using the term 'consist' in a very different sense from its use when we spoke of the piece of granite as consisting of the above-mentioned elements. The elements of granite are utterly indifferent to their combination: they could subsist as well without it. The different parts and members of an organic body on the contrary subsist only in their union: they cease to exist as such, when they are separated from each other.

§ 127

Thus Matter is the mere abstract or indeterminate reflection-into-something-else, or reflection-into-self at the same time as determinate; it is consequently Thinghood which then and there is the subsistence of the thing. By this means the thing has on the part of the matters its reflection-into-self (the reverse of § 125); it subsists not on its own part, but consists of the matters, and is only a superficial association between them, an external combination of them.

Form

§ 128

Matter, being the immediate unity of existence with itself, is also indifferent towards specific character. Hence the numerous diverse matters coalesce into the one Matter, or into existence under the reflective characteristic of identity. In contrast to this one Matter these distinct properties and their external relation which they have to one another in the thing, constitute the Form – the reflective category of difference, but a difference which exists and is a totality.

This one featureless Matter is also the same as the Thing-in-itself was: only the latter is intrinsically quite abstract, while the former essentially implies relation to something else, and in the first place to the Form.

The various matters of which the thing consists are potentially the same as one another. Thus we get one Matter in general to which the difference is expressly attached externally and as a bare form. This theory which holds things all round to have one and the same matter at bottom, and merely to differ externally in respect of form, is much in vogue with the reflective understanding. Matter in that case counts for naturally indeterminate, but susceptible of any determination; while at the same time it is perfectly permanent, and continues the same amid all change and alteration. And in finite things at least this disregard of matter for any determinate form is certainly exhibited. For example, it matters not to a block of marble, whether it receive the form of this or that statue or even the form of a pillar. Be it noted however that a block of marble can disregard form only relatively, that is, in reference to the sculptor: it is by no means purely formless. And so the mineralogist considers the relatively formless marble as a special formation of rock, differing from other equally special formations, such as sandstone or porphyry. Therefore we say it is an abstraction of the understanding which isolates matter into a certain natural formlessness. For properly speaking the thought of matter includes the principle of form throughout, and no formless matter therefore appears,

anywhere even in experience as existing. Still the conception of matter as original and pre-existent, and as naturally formless, is a very ancient one; it meets us even among the Greeks, at first in the mythical shape of Chaos, which is supposed to represent the unformed substratum of the existing world. Such a conception must of necessity tend to make God not the Creator of the world, but a mere world-moulder or demiurge. A deeper insight into nature reveals God as creating the world out of nothing. And that teaches two things. On the one hand it enunciates that matter, as such, has no independent subsistence, and on the other that the form does not supervene upon matter from without, but as a totality involves the principle of matter in itself. This free and infinite form will hereafter come before us as the notion.

§ 129

Thus the Thing suffers a disruption into Matter and Form. Each of these is the totality of thinghood and subsists for itself. But Matter, which is meant to be the positive and indeterminate existence, contains, as an existence, reflection-on-another, every whit as much as it contains self-enclosed being. Accordingly as uniting these characteristics, it is itself the totality of Form. But Form, being a complete whole of characteristics, *ipso facto* involves reflection-into-self; in other words, as self-relating Form it has the very function attributed to Matter. Both are at bottom the same. Invest them with this unity, and you have the relation of Matter and Form, which are also no less distinct.

The Theory of “Matters”

§ 130

The Thing, being this totality, is a contradiction. On the side of its negative unity it is Form in which Matter is determined and deposed to the rank of properties (§ 125). At the same time it consists of Matters, which in the reflection-of-the-thing-into-itself are as much independent as they are at the same time negatived. Thus the thing is the essential existence, in such a way as to be an existence that suspends or absorbs itself in itself. In other words, the thing is an Appearance or Phenomenon.

The negation of the several matters, which is insisted on in the thing no less than their independent existence, occurs in Physics as *porosity*. Each of the several matters (coloured matter, odorific matter, and if we believe some people, even sound-matter – not excluding caloric, electric matter, etc.) is also negated: and in this negation of theirs, or as interpenetrating their pores, we find the numerous other independent matters, which, being similarly porous, make room in turn for the existence of the rest. Pores are not empirical facts; they are figments of the understanding, which uses them to represent the element of negation in independent matters. The further working-out of the contradictions is concealed by the nebulous imbroglio in which all matters are independent and all no less negated in each other. If the faculties or activities are similarly hypostatised in the mind, their living unity similarly turns to the imbroglio of an action of the one on the others.

These pores (meaning thereby not the pores in an organic body, such as the pores of wood or of the skin, but those in the so-called ‘matters’, such as colouring matter, caloric, or metals, crystals, etc.) cannot be verified by observation. In the same way matter itself – furthermore form which is separated from matter – whether that be the thing as consisting of matters, or the view that the thing itself subsists and only has properties, is all a product of the reflective understanding which, while it observes and professes to record only what it observes, is rather creating a metaphysic, bristling with contradictions of which it is unconscious.

econd Subdivision: Essence B. APPEARANCE

World of Appearance — Content & Form — Relation

§ 131

The Essence must appear or shine forth. Its shining or reflection in it is the suspension and translation of it to immediacy, which, while as reflection-into-self it is matter or subsistence, is also form, reflection-on-something-else, a subsistence which sets itself aside. To show or shine is the characteristic by which essence is distinguished from Being — by which it is essence; and it is this show which, when it is developed, shows itself, and is Appearance. Essence accordingly is not something beyond or behind appearance, but — just because it is the essence which exists — the existence is Appearance (Forth-shining).

Existence stated explicitly in its contradiction is Appearance. But appearance (forth-showing) is not to be confused with a mere show (shining). Show is the proximate truth of Being or immediacy. The immediate, instead of being, as we suppose, something independent, resting on its own self, is a mere show, and as such it is packed or summed up under the simplicity of the immanent essence. The essence is, in the first place, the sum total of the showing itself, shining in itself (inwardly); but, far from abiding in this inwardness, it comes as a ground forward into existence; and this existence being grounded not in itself, but on something else, is just appearance. In our imagination we ordinarily combine with the term appearance or phenomenon the conception of an indefinite congeries of things existing, the being of which is purely relative, and which consequently do not rest on a foundation of their own, but are esteemed only as passing stages. But in this conception it is no less implied that essence does not linger behind or beyond appearance. Rather it is, we may

say, the infinite kindness which lets its own show freely issue into immediacy, and graciously allows it the joy of existence. The appearance which is thus created does not stand on its own feet, and has its being not in itself but in something else. God who is the essence, when he lends existence to the passing stages of his own show in himself, may be described as the goodness that creates the world: but he is also the power above it, and the righteousness, which manifests the merely phenomenal character of the content of this existing world, whenever it tries to exist in independence.

Appearance is in every way a very important grade of the logical idea. It may be said to be the distinction of philosophy from ordinary consciousness that it sees the merely phenomenal character of what the latter supposes to have a self-subsistent being. The significance of appearance however must be properly grasped, or mistakes will arise. To say that anything is *mere* appearance may be misinterpreted to mean that, as compared to what is merely phenomenal, there is greater truth in the immediate, in that which *is*. Now, in strict fact, the case is precisely the reverse.

Appearance is higher than mere Being — a richer category because it holds in combination the two elements of reflection-into-self and reflection-into-other: whereas Being (or immediacy) is still mere relationlessness, and apparently rests upon itself alone. Still, to say that anything is *only* an appearance suggests a real flaw, which consists in this, that Appearance is still divided against itself and without intrinsic stability. Beyond and above mere appearance comes in the first place Actuality, the third grade of Essence, of which we shall afterwards speak.

In the history of Modern Philosophy, Kant has the merit of first rehabilitating this distinction between the common and the philosophic modes of thought. He stopped half-way, however, when he attached to Appearance a subjective meaning only, and put the abstract essence

immovable outside it as the thing-in-itself beyond the reach of our cognition.

For it is the very nature of the world of immediate objects to be appearance only. Knowing it to be so, we know at the same time, the essence, which, far from staying behind or beyond the appearance, rather manifests its own essentiality by deposing the world to a mere appearance. One can hardly quarrel with the plain man who, in his desire for totality, cannot acquiesce in the doctrine of subjective idealism, that we are solely concerned with phenomena.

The plain man, however, in his desire to save the objectivity of knowledge, may very naturally return to abstract immediacy and maintain that immediacy to be true and actual. In a little work published under the title *A Report, Clear as Day, to the Larger Public touching the Proper Nature of the Latest Philosophy: an Attempt to force the Reader to understand*, Fichte examined the opposition between subjective idealism and immediate consciousness in a popular form, under the shape of a dialogue between the author and the reader, and tried hard to prove that the subjective idealist's view was right.

In this dialogue the reader complains to the author that he has completely failed to place himself in the idealist's position, and is inconsolable in the thought that things around him are not real things but mere appearances. The affliction of the reader can scarcely be blamed when he is expected to consider himself hemmed in by an impervious circle of purely subjective conceptions. Apart from this subjective view of Appearance, however, we have all reason to rejoice that the things which environ us are appearances and not steadfast and independent existences; since in that case we should soon perish of hunger, both bodily and mental.

(a) The World of Appearances

§ 132

The Apparent or Phenomenal exists in such a way that its subsistence is *ipso facto* thrown into abeyance or suspended and is only one stage in the form itself. The form embraces in it the matter or subsistence as one of its characteristics. In this way the phenomenal has its ground in this (form) as its essence, its reflection-into-self in contrast with its immediacy, but, in so doing, has it only in another aspect of the form. This ground of its is no less phenomenal than itself, and the phenomenon accordingly goes on to an endless mediation of subsistence by means of form, and thus equally by non-subsistence. This endless intermediation is at the same time a unity of self-relation; and existence is developed into a totality, into a world of phenomena — of reflected finitude.

(b) Content and Form

§ 133

Outside one another as the phenomena in this phenomenal world are, they form a totality, and are wholly contained in their self-relatedness. In this way the self-relation of the phenomenon is completely specified, it has the Form in itself: and because it is in this identity, has it as essential subsistence. So it comes about that the form is Content: and in its phase is the Law of the Phenomenon. When the form, on the contrary, is not reflected into self, it is equivalent to the negative of the phenomenon, to the non-independent and changeable: and that sort of form is the indifferent or External Form.

The essential point to keep in mind about the opposition of Form and Content is that the content is not formless, but has the form in its own self,

quite as much as the form is external to it. There is thus a doubling of form. At one time it is reflected into itself; and then is identical with the content. At another time it is not reflected into itself, and then it is external existence, which does not at all affect the content. We are here in presence, implicitly, of the absolute correlation of content and form: viz., their reciprocal revulsion, so that content is nothing but the revulsion of form into content, and form nothing but the revulsion of content into form. This mutual revulsion is one of the most important laws of thought. But it is not explicitly brought out before the Relations of Substance and Causality.

Form and content are a pair of terms frequently employed by the reflective understanding, especially with a habit of looking on the content as the essential and independent, the form on the contrary as the unessential and dependent. Against this it is to be noted that both are in fact equally essential; and that, while a formless *content* can be as little found as a formless *matter*, the two (content and matter) are distinguished by this circumstance, that matter, though implicitly not without form, still in its existence manifests a disregard of form, whereas the content, as such, is what it is only because the matured form is included in it. Still the form still suffers from externality. In a book, for instance, it certainly has no bearing upon the content, whether it be written or printed, bound in paper or in leather. That however does not in the least imply that apart from such an indifferent and external form, the content of the book is itself formless. There are undoubtedly books enough which even in reference to their content may well be styled formless: but want of form in this case is the same as bad form, and means the defect of the right form, not the absence of all form whatever. So far is this right form from being unaffected by the content that it is rather the content itself. A work of art that wants the right form is for that very reason no right or true work of art: and it is a bad way of excusing an artist, to say that the content of his works is good and even

excellent, though they want the right form. Real works of art are those where content and form exhibit a thorough identity. The content of the Iliad, it may be said, is the Trojan war, and especially the wrath of Achilles. In that we have everything, and yet very little after all; for the Iliad is made an Iliad by the poetic form, in which that content is moulded. The content of Romeo and Juliet may similarly be said to be the ruin of two lovers through the discord between their families: but something more is needed to make Shakespeare's immortal tragedy.

In reference to the relation of form and content in the field of science, we should recollect the difference between philosophy and the rest of the sciences. The latter are finite, because their mode of thought, as a merely formal act, derives its content from without. Their content therefore is not known as moulded from within through the thoughts which lie at the ground of it, and form and content do not thoroughly interpenetrate each other. This partition disappears in philosophy, and thus justifies its title of infinite knowledge. Yet even philosophic thought is often held to be a merely formal act; and that logic, which confessedly deals only with thoughts qua thoughts, is merely formal, is especially a foregone conclusion. And if content means no more than what is palpable and obvious to the senses, all philosophy and logic in particular must be at once acknowledged to be void of content, that is to say, of content perceptible to the senses. Even ordinary forms of thought, however, and the common usage of language, do not in the least restrict the appellation of content to what is perceived by the senses, or to what has a being in place and time.

A book without content is, as every one knows, not a book with empty leaves, but one of which the content is as good as none. We shall find as the last result on closer analysis, that by what is called content an educated mind means nothing but the presence and power of thought. But this is to admit that thoughts are not empty forms without affinity to their content,

and that in other spheres as well as in art the truth and the sterling value of the content essentially depend on the content showing itself identical with the form.

§ 134

But immediate existence is a character of the subsistence itself as well as of the form: it is consequently external to the character of the content; but in an equal degree this externality, which the content has through the factor of its subsistence, is essential to it. When thus explicitly stated, the phenomenon is relativity or correlation: where one and the same thing, viz. the content or the developed form, is seen as the externality and antithesis of independent existences, and as their reduction to a relation of identity in which identification alone the two things distinguished are what they are.

(c) Relation or Correlation

§ 135

[a] The immediate relation is that of the Whole and the Parts. The content is the whole, and consists of the parts (the form), its counterpart. The parts are diverse from one another. It is they that possess independent being. But they are parts, only when they are identified by being related to one another; or, in so far as they make up the whole, when taken together. But this 'together' is the counterpart and negation of the part.

Essential correlation is the specific and completely universal phase in which things appear. Everything that exists stands in correlation, and this correlation is the veritable nature of every existence. The existent thing in this way has no being of its own, but only in something else: in this other however it is self-relation; and correlation is the unity of the self-relation and relation-to-others. The relation of the whole and the parts is untrue to

this extent, that the notion and the reality of the relation are not in harmony. The notion of the whole is to contain parts: but if the whole is taken and made what its notion implies, i.e. if it is divided, it at once ceases to be a whole. Things there are no doubt, which correspond to this relation: but for that very reason they are low and untrue existences. We must remember, however, what ‘untrue’ signifies. When it occurs in a philosophical discussion, the term ‘untrue’ does not signify that the thing to which it is applied is non-existent. A bad state or a sickly body may exist all the same; but these things are untrue, because their notion and their reality are out of harmony.

The relation of whole and parts, being the immediate relation, comes easy to reflective understanding: and for that reason it often satisfies when the question really turns on profounder ties. The limbs and organs for instance, of an organic body are not merely parts of it: it is only in their unity that they are what they are, and they are unquestionably affected by that unity, as they also in turn affect it. These limbs and organs become mere parts, only when they pass under the hands of an anatomist, whose occupation be it remembered, is not with the living body but with the corpse. Not that such analysis is illegitimate: we only mean that the external and mechanical relation of whole and parts is not sufficient for us, if we want to study organic life in its truth. And if this be so in organic life, it is the case to a much greater extent when we apply this relation to the mind and the formations of the spiritual world. Psychologists may not expressly speak of parts of the soul or mind, but the mode in which this subject is treated by the analytic understanding is largely founded on the analogy of this finite relation. At least that is so, when the different forms of mental activity are enumerated and described merely in their isolation one after another, as so-called special powers and faculties.

Force and the expression of force

§ 136

[b] The one-and-same of this correlation (the self-relation found in it) is thus immediately a negative self-relation. The correlation is in short the mediating process whereby one and the same is first unaffected towards difference, and secondly is the negative self-relation, which repels itself as reflection-into-self to difference, and invests itself (as reflection-into-something-else) with existence, whilst it conversely leads back this reflection-into-other to self-relation and indifference. This gives the correlation of Force and its Expression (*Äußerung*).

The relationship of whole and part is the immediate and therefore unintelligent (mechanical) relation — a revulsion of self-identity into mere variety. Thus we pass from the whole to the parts, and from the parts to the whole: in the one we forget its opposition to the other, while each on its own account, at one time the whole, at another the parts, is taken to be an independent existence. In other words, when the parts are declared to subsist in the whole, and the whole to consist of the parts, we have either member of the relation at different times taken to be permanently subsistent, while the other is non-essential. In its superficial form the mechanical nexus consists in the parts being independent of each other and of the whole.

This relation may be adopted for the progression ad infinitum, in the case of the divisibility of matter: and then it becomes an unintelligent alternation with the two sides. A thing at one time is taken as a whole: then we go on to specify the parts: this specifying is forgotten, and what was a part is regarded as a whole: then the specifying of the part comes up again, and so on for ever. But if this infinity be taken as the negative which it is, it is the negative self-relating element in the correlation — Force, the self-identical whole, or immanency — which yet supersedes this immanency and gives itself expression; and conversely the expression which vanishes and returns into Force.

Force, notwithstanding this infinity, is also finite: for the content, or the one and the same of the Force and its out-putting, is this identity at first only for the observer: the two sides of the relation are not yet, each on its own account, the concrete identity of that one and same, not yet the totality. For one another they are therefore different, and the relationship is a finite one. Force consequently requires solicitation from without: it works blindly: and on account of this defectiveness of form, the content is also limited and accidental. It is not yet genuinely identical with the form: not yet is it as a notion and an end; that is to say, it is not intrinsically and actually determinate. This difference is most vital, but not easy to apprehend: it will assume a clearer formulation when we reach Design. If it be overlooked, it leads to the confusion of conceiving God as Force, a confusion from which Herder's God especially suffers.

It is often said that the nature of Force itself is unknown and only its manifestation apprehended. But, in the first place, it may be replied, every article in the import of Force is the same as what is specified in the Expression: and the explanation of a phenomenon by a Force is a mere tautology. What is supposed to remain unknown, therefore, is really nothing but the empty form of reflection-into-self, by which alone the Force is distinguished from the Expression — and that form too is something familiar. It is a form that does not make the slightest addition to the content and to the law, which have to be discovered from the phenomenon alone. Another assurance always given is that to speak of forces implies no theory as to their nature: and that being so, it is impossible to see why the form of Force has been introduced into the sciences at all. In the second place the nature of Force is undoubtedly unknown: we are still without any necessity binding and connecting its content together in itself, as we are without necessity in the content, in so far as it is expressly limited and hence has its character by means of another thing outside it.

(1) Compared with the immediate relation of whole and parts, the relation between force and its putting-forth may be considered infinite. In it that identity of the two sides is realised, which in the former relation only existed for the observer. The whole, though we can see that it consists of parts, ceases to be a whole when it is divided: whereas force is only shown to be force when it exerts itself, and in its exercise only comes back to itself. The exercise is only force once more. Yet, on further examination even this relation will appear finite, and finite in virtue of this mediation: just as, conversely, the relation of whole and parts is obviously finite in virtue of its immediacy. The first and simplest evidence for the finitude of the mediated relation of force and its exercise is, that each and every force is conditioned and requires something else than itself for its subsistence. For instance, a special vehicle of magnetic force, as is well known, is iron, the other properties of which, such as its colour, specific weight, or relation to acids, are independent of this connection with magnetism. The same thing is seen in all other forces, which from one end to the other are found to be conditioned and mediated by something else than themselves. Another proof of the finite nature of force is that it requires solicitation before it can put itself forth. That through which the force is solicited, is itself another expression of force, which cannot put itself forth without similar solicitation. This brings us either to a repetition of the infinite progression, or to a reciprocity of soliciting and being solicited. In either case we have no absolute beginning of motion. Force is not as yet, like the final cause, inherently self-determining: the content is given to it as determined, and force, when it exerts itself, is, according to the phrase, blind in its working. That phrase implies the distinction between abstract force-manifestation and teleological action.

(2) The oft-repeated statement, that the exercise of the force and not the force itself admits of being known, must be rejected as groundless. It is the

very essence of force to manifest itself, and thus in the totality of manifestation, conceived as a law, we at the same time discover the force itself. And yet this assertion that force in its own self is unknowable betrays a well-grounded presentiment that this relation is finite. The several manifestations of a force at first meet us in indefinite multiplicity, and in their isolation seem accidental: but, reducing this multiplicity to its inner unity, which we term force, we see that the apparently contingent is necessary, by recognising the law that rules it. But the different forces themselves are a multiplicity again, and in their mere juxtaposition seem to be contingent. Hence in empirical physics, we speak of the forces of gravity, magnetism, electricity, etc., and in psychology of the forces of memory, imagination, will, and all the other faculties. All this multiplicity again excites a craving to know these different forces as a single whole, nor would this craving be appeased even if the several forces were traced back to one common primary force. Such a primary force would be really no more than an empty abstraction, with as little content as the abstract thing-in-itself. And besides this, the correlation of force and manifestation is essentially a mediated correlation (of reciprocal dependence), and it must therefore contradict the notion of force to view it as primary or resting on itself.

Such being the case with the nature of force, though we may consent to let the world be called a manifestation of divine forces, we should object to have God himself viewed as a mere force. For force is after all a subordinate and finite category. At the so-called renaissance of the sciences, when steps were taken to trace the single phenomena of nature back to underlying forces, the Church branded the enterprise as impious. The argument of the Church was as follows. If it be the forces of gravitation, of vegetation, etc., which occasion the movements of the heavenly bodies, the growth of plants, etc., there is nothing left for divine providence, and God

sinks to the level of a leisurely onlooker, surveying this play of forces. The students of nature, it is true, and Newton more than others, when they employed the reflective category of force to explain natural phenomena, have expressly pleaded that the honour of God, as the Creator and Governor of the world, would not thereby be impaired. Still the logical issue of this explanation by means of forces is that the inferential understanding proceeds to fix each of these forces, and to maintain them in their finitude as ultimate. And contrasted with this de-infinitised world of independent forces and matters, the only terms in which it is possible still to describe God will present him in the abstract infinity of an unknowable supreme Being in some other world far away. This is precisely the position of materialism, and of modern 'freethinking', whose theology ignores what God is and restricts itself to the mere fact *that* he is. In this dispute therefore the Church and the religious mind have to a certain extent the right on their side. The finite forms of understanding certainly fail to fulfil the conditions for a knowledge either of Nature or of the formations in the world of Mind as they truly are. Yet on the other side it is impossible to overlook the formal right which, in the first place, entitles the empirical sciences to vindicate the right of thought to know the existent world in all the speciality of its content, and to seek something further than the bare statement of mere abstract faith that God created and governs the world. When our religious consciousness, resting on the authority of the Church, teaches us that God created the world by his almighty will, that he guides the stars in their courses, and vouchsafes to all his creatures their existence and their well-being, the question Why? is still left to answer. Now it is the answer to this question which forms the common task of empirical science and of philosophy. When religion refuses to recognise this problem, or the right to put it, and appeals to the unsearchableness of the decrees of God, it is taking up the same agnostic ground as is taken by the mere Enlightenment of

understanding. Such an appeal is no better than an arbitrary dogmatism, which contravenes the express command of Christianity, to know God in spirit and in truth, and is prompted by a humility which is not Christian, but born of ostentatious bigotry.

§ 137

Force is a whole, which is in its own self negative self-relation; and as such a whole it continually pushes itself off from itself and puts itself forth. But since this reflection-into-another (corresponding to the distinction between the Parts of the Whole) is equally a reflection-into-self, this out-putting is the way and means by which Force that returns back into itself is as a Force. The very act of out-putting accordingly sets in abeyance the diversity of the two sides which is found in this correlation, and expressly states the identity which virtually constitutes their content. The truth of Force and utterance therefore is that relation, in which the two sides are distinguished only as Outward and Inward.

§ 138

The Inward (Interior) is the ground, when it stands as the mere form of the one side of the Appearance and the Correlation — the empty form of reflection-into-self. As a counterpart to it stands the Outward (Exterior) — Existence — also as form of the other side of the correlation, with the empty characteristic of reflection-into-something-else. But Inward and Outward are identified: and their identity is identity brought to fullness in the content, that unity of reflection-into-self and reflection-into-other which was forced to appear in the movement of force. Both are the same one identity, and this unity makes them the content.

§ 139

In the first place then, Exterior is the same content as Interior. What is inwardly is also found outwardly, and vice versa. The appearance shows nothing that is not in the essence, and in the essence there is nothing but what is manifested.

§ 140

In the second place, Inward and Outward, as formal terms, are also reciprocally opposed, and that thoroughly. The one is the abstraction of identity with self; the other mere multiplicity or reality. But as stages of the one form, they are essentially identical so that whatever is at first explicitly put only in the one abstraction, is also plainly and at one step in the other. Therefore what is only internal is also only external: and what is only external, is so far only at first internal.

It is the customary mistake of reflection to take essence to be merely the interior. If it be so taken, even this way of looking at it is purely external, and that sort of essence is the empty external abstraction.

Ins Innere der Natur
Dringt kein erschaffner Geist,
Zu glücklich wenn er nur
De äussere Schaale weisst.

It ought rather to have been said that, if the essence of nature is ever described as the inner part, the person who so describes it only knows its outer shell. In Being as a whole, or even in mere sense-perception, the notion is at first only an inward, and for that very reason is something external to Being, a subjective thinking and being, devoid of truth. In Nature as well as in Mind, so long as the notion, design, or law are at first the inner capacity, mere possibilities, they are first only an external, inorganic nature, the knowledge of a third person, alien force, and the like.

As a man is outwardly, that is to say in his actions (not of course in his merely bodily outwardness), so he is inwardly: and if his virtue, morality, etc. are only inwardly his — that is if they exist only in his intentions and sentiments, and his outward acts are not identical with them — the one half of him is as hollow and empty as the other.

The relation of Outward and Inward unites the two relations that precede, and at the same time sets in abeyance mere relativity and phenomenality in general. Yet so long as understanding keeps the Inward and Outward fixed in their separation, they are empty forms, the one as null as the other. Not only in the study of nature, but also of the spiritual world, much depends on a just appreciation of the relation of inward and outward, and especially on avoiding the misconception that the former only is the essential point on which everything turns, while the latter is unessential and trivial. We find this mistake made when, as is often done, the difference between nature and mind is traced back to the abstract difference between inner and outer. As for nature, it certainly is in the gross external, not merely to the mind, but even on its own part. But to call it external 'in the gross' is not to imply an abstract externality – for there is no such thing. It means rather that the Idea which forms the common content of nature and mind, is found in nature as outward only, and for that very reason only inward. The abstract understanding, with its 'either-or', may struggle against this conception of nature. It is none the less obviously found in our other modes of consciousness, particularly in religion. It is the lesson of religion that nature, no less than the spiritual world, is a revelation of God: but with this distinction, that while nature never gets so far as to be conscious of its divine essence, that consciousness is the express problem of the mind, which in the matter of that problem is as yet finite. Those who look upon the essence of nature as mere inwardness, and therefore inaccessible to us, take up the same line as that ancient creed which

regarded God as envious and jealous; a creed which both Plato and Aristotle pronounced against long ago. All that God is, he imparts and reveals; and he does so at first in and through nature.

Any object indeed is faulty and imperfect when it is only inward, and thus at the same time only outward, or (which is the same thing) when it is only an outward and thus only an inward. For instance, a child, taken in the gross as human being, is no doubt a rational creature; but the reason of the child as child is at first a mere inward, in the shape of his natural ability or vocation, etc. This mere inward, at the same time, has for the child the form of a mere outward, in the shape of the will of his parents, the attainments of his teachers, and the whole world of reason that environs him. The education and instruction of a child aim at making him actually and for himself what he is at first only potentially and therefore for others, viz., for his grown up friends. The reason, which at first exists in the child only as an inner possibility, is actualised through education: and conversely, the child by these means becomes conscious that the goodness, religion, and science which he had at first looked upon as an outward authority, are his own nature. As with the child so it is in this matter with the adult, when, in opposition to his true destiny, his intellect and will remain in the bondage of the natural man. Thus, the criminal sees the punishment to which he has to submit as an act of violence from without; whereas in fact the penalty is only the manifestation of his own criminal will.

From what has now been said, we may learn what to think of a man who, when blamed for his shortcomings, or, it may be, his discreditable acts, appeals to the (professedly) excellent intentions and sentiments of the inner self he distinguishes therefrom. There certainly may be individual cases where the malice of outward circumstances frustrates well-meant designs, and disturbs the execution of the best-laid plans. But in general even here the essential unity between inward and outward is maintained. We are thus

justified in saying that a man is what he does; and the lying vanity which consoles itself with the feeling of inward excellence may be confronted with the words of the Gospel: ‘By their fruits ye shall know them.’ That grand saying applies primarily in a moral and religious aspect, but it also holds good in reference to performances in art and science. The keen eye of a teacher who perceives in his pupil decided evidences of talent, may lead him to state his opinion that a Raphael or a Mozart lies hidden in the boy: and the result will show how far such an opinion was well-founded. But if a daub of a painter, or a poetaster, soothe themselves by the conceit that their head is full of high ideas, their consolation is a poor one; and if they insist on being judged not by their actual works but by their projects, we may safely reject their pretensions as unfounded and unmeaning. The converse case however also occurs. In passing judgment on men who have accomplished something great and good, we often make use of the false distinction between inward and outward. All that they have accomplished, we say, is outward merely; inwardly they were acting from some very different motive, such as a desire to gratify their vanity or other unworthy passion. This is the spirit of envy. Incapable of any great action of its own, envy tries hard to depreciate greatness and to bring it down to its own level. Let us, rather, recall the fine expression of Goethe, that there is no remedy but Love against great superiorities of others. We may seek to rob men’s great actions of their grandeur, by the insinuation of hypocrisy; but, though it is possible that men in an instance now and then may dissemble and disguise a good deal, they cannot conceal the whole of their inner self, which infallibly betrays itself in the *decursus vitae.* Even here it is true that a man is nothing but the series of his actions.

What is called the ‘pragmatic’ writing of history has in modern times frequently sinned in its treatment of great historical characters, and defaced and tarnished the true conception of them by this fallacious separation of

the outward and the inward. Not content with telling the unvarnished tale of the great acts which have been wrought by the heroes of the world's history, and with acknowledging that their inward being corresponds with the import of their acts, the pragmatic historian fancies himself justified and even obliged to trace the supposed secret motives that lie behind the open facts of the record. The historian, in that case, is supposed to write with more depth in proportion as he succeeds in tearing away the aureole from all that has been heretofore held grand and glorious, and in depressing it, so far as its origin and proper significance are concerned, to the level of vulgar mediocrity. To make these pragmatic researches in history easier, it is usual to recommend the study of psychology, which is supposed to make us acquainted with the real motives of human actions. The psychology in question however, is only that petty knowledge of men, which looks away from the essential and permanent in human nature to fasten its glance on the casual and private features shown in isolated instincts and passions. A pragmatic psychology ought at least to leave the historian, who investigates the motives at the ground of great actions, a choice between the 'substantial' interests of patriotism, justice, religious truth, and the like, on the one hand, and the subjective and 'formal' interests of vanity, ambition, avarice, and the like, on the other. The latter, however, are the motives which must be viewed by the pragmatist as really efficient, otherwise the assumption of a contrast between inward (the disposition of the agent) and the outward (the import of the action) would fall to the ground. But inward and outward have in truth the same content; and the right doctrine is the very reverse of this pedantic judiciality. If the heroes of history had been actuated by subjective and formal interests alone, they would never have accomplished what they have. And if we have due regard to the unity between the inner and the outer, we must own that great men willed what they did, and did what they willed.

§ 141

The empty abstractions, by means of which the one identical content perforce continues in the two correlatives, suspend themselves in the immediate transition, the one into the other. The content is itself nothing but their identity (§ 138): and these abstractions are the seeming of essence, put as seeming. By the manifestation of force the inward is put into existence: but this putting is the mediation by empty abstractions. In its own self the intermediating process vanishes to the immediacy, in which the inward and the outward are absolutely identical and their difference is distinctly no more than assumed and imposed. This identity is Actuality.

C. ACTUALITY

Substantiality - Causality - Reciprocity

§ 142

Actuality is the unity, become immediate, of essence with existence, or of inward with outward. The utterance of the actual is the actual itself: so that in this utterance it remains just as essential, and only is essential, in so far as it is immediate external existence.

We have ere this met Being and Existence as forms of the immediate. Being is, in general, unreflected immediacy and transition into another. Existence is immediate unity of being and reflection: hence appearance; it comes from the ground, and falls to the ground.

In actuality this unity is explicitly put, and the two sides of the relation identified. Hence the actual is exempted from transition, and its externality is its energising. In that energising it is reflected into itself: its existence is only the manifestation of itself, not of another.

Exists but not Real

Actuality and thought (or Idea) are often absurdly opposed. How commonly we hear people saying that, though no objection can be urged against the truth and correctness of a certain thought, there is nothing of the kind to be seen in reality, or it cannot be actually carried out! People who use such language only prove that they have not properly apprehended the nature either of thought or of actuality. Thought in such a case is, one the one hand, the synonym for a subjective conception, plan, intention, or the like, just as actuality, on the other, is made synonymous with external and sensible existence. This is all very well in common life, where great laxity is allowed in the categories and the names given to them; and it may of course happen that, e.g., the plan, or so-called idea, say, of a certain method of taxation , is good and advisable in the abstract, but that nothing of the sort is found in so-called actuality, or could possibly be carried out under the given conditions. But when the abstract understanding gets hold of these categories and exaggerates the distinction they imply into a hard and fast line of contrast, when it tells us that in this actual world we must knock ideas out of our heads, it is necessary energetically to protest against these doctrines, alike in the name of science and of sound reason. For on the one hand Ideas are not confined to our heads merely, nor is the Idea, on the whole, so feeble as to leave the question of its actualisation or non-actualisation dependent on our will. The Idea is rather the absolutely active as well as actual.

The Actual is Real

And on the other hand actuality is not so bad and irrational, as purblind or wrong-headed and muddle-brained would-be reformers imagine. So far is actuality, as distinguished from mere appearance, and primarily presenting a unity of inward and outward, from being in contrariety with reason, that it is rather thoroughly reasonable, and everything which is not reasonable must

on that very ground cease to be held actual. The same view may be traced in the usages of educated speech, which declines to give the name of real poet or real statesman to a poet or a statesman who can do nothing really meritorious or reasonable.

In that vulgar conception of actuality which mistakes for what is palpable and directly obvious to the senses, we must seek the ground of a widespread prejudice about the relation of the philosophy of Aristotle to that of Plato. Popular opinion makes the difference to be as follows. While Plato recognises the idea and only the idea as the truth, Aristotle, rejecting the idea, keeps to what is actual, and is on that account to be considered the founder and chief of empiricism. On this it may be remarked: that it is not the vulgar actuality of what is immediately at hand, but the idea as actuality. Where then lies the controversy of Aristotle against Plato? It lies in this: Aristotle calls the Platonic idea a mere *dynamis*, and establishes in opposition to Plato that the idea, which both equally recognise to be the only truth, is essentially to be viewed as an *energeia*, in other words, as the inward which is quite to the fore, or as unity of inner and outer, or as actuality, in the emphatic sense here given to the word.

Actuality is concrete

§ 143

Such a concrete category as Actuality includes the characteristics aforesaid and their difference, and is therefore also the development of them, in such a way that, as it has them, they are at the same time plainly understood to be a show, to be assumed or imposed.

Possibility

[a] Viewed as an identity in general, Actuality is first of all Possibility – the reflection-into-self which, as in contrast with the concrete unity of the

actual, is taken and made an abstract and unessential essentiality. Possibility is what is essential to reality, but in such a way that it is at the same time only a possibility.

It was probably the import of Possibility which induced Kant to regard it along with necessity and actuality as Modalities, ‘since these categories do not in the least increase the notion as object, but only express its relation to the faculty of knowledge’. For Possibility is really the bare abstraction of reflection-into-self - what was formerly called the Inward, only that it is now taken to mean the external inward, lifted out of reality and with the being of a mere supposition, and is thus, sure enough, supposed only as a bare modality, an abstraction which comes short, and, in more concrete terms, belongs only to subjective thought. It is otherwise with Actuality and Necessity. They are anything but a mere sort and mode for something else: in fact the very reverse of that. If they are supposed, it is as the concrete, but not merely suppositions, but intrinsically complete.

As Possibility is, in the first instance, the mere form of identity-with-self (as compared with the concrete which is actual), the rule for it merely is that a thing must not be self-contradictory. Thus everything is possible; for an act of abstraction can give any content this form of identity. Everything however is as impossible as it is possible. In every content - which is and must be concrete - the speciality of its nature may be viewed as a specialised contrariety and in that way as a contradiction. Nothing therefore can be more meaningless than to speak of such possibility and impossibility.

In philosophy in particular, there should never be a word said of showing that “It is possible”, or “There is still another possibility”, or, to adopt another phraseology, “It is conceivable”. The same consideration should warn the writer of history against employing a category which has now been explained to be on its own merits, untrue: but the subtlety of the empty

understanding finds its chief pleasure in the fantastic ingenuity of suggesting possibilities and lots of possibilities.

Possible and Actual

Our picture-thought is at first disposed to see in possibility the richer and more comprehensive, in actuality the poorer and narrower category. Everything, it is said, is possible, but everything which is possible is not on that account actual. In real truth, however, if we deal with them as thoughts, actuality is the more comprehensive, because it is the concrete thought which includes possibility as an abstract element. And that superiority is to some extent expressed in our ordinary mode of thought when we speak of the possible, in distinction from the actual, as *only* possible. Possibility is often said to consist in a thing's being thinkable.

'Think' however, in this use of the word, only means to conceive any content under the form of an abstract identity. Now, every content can be brought under this form, since nothing is required except to separate it from the relation in which it stands. Hence, any content, however absurd and nonsensical, can be viewed as possible. It is possible that the moon may fall upon the Earth tonight; for the moon is a body separate from the Earth and may as well fall down upon it as a stone thrown into the air does. . . . In language like this about possibilities, it is chiefly the law of sufficient ground or reason which is manipulated in the style already explained. Everything, it is said, is possible, for which you can state some ground. The less education a man has, or in other words, the less he knows of the specific connection of the objects to which he directs his observations, the greater is his tendency to launch out into all sorts of empty possibilities. An instance of this habit in the political sphere is seen in the pot-house politician. In practical life too it is no uncommon thing to see ill will and indolence slink behind the category of possibility, in order to escape definite obligations. To such conduct the same remarks apply as were made in

connection with the law of sufficient ground. Reasonable and practical men refused to be imposed upon by the possible, for the simple ground that it is possible only. They stick to the actual (not meaning by that word merely whatever immediately is now and here). Many of the proverbs of common life express the same contempt for what is abstractly possible. ‘A bird in the hand is worth two in the bush’.

Everything is Possible?

After all, there is as good reason for taking everything to be impossible as to be possible: for every content (a content is always concrete) includes not only diverse but even opposite characteristics. Nothing is so impossible for instance, as this, that I am: for ‘I’ is at the same time simple self-relation and, as undoubtedly, relation to something else. The same may be seen in every other fact in the natural or spiritual world. Matter, it may be said, is impossible: for it is the unity of attraction and repulsion. The same is true of life, law, freedom ...

Generally speaking, it is the empty understanding which haunts these empty forms: and the business of philosophy in the matter is to show how null and meaningless they are. Whether a thing is possible or impossible, depends altogether on the subject-matter: that is, on the sum total of the elements in actuality, which, as it opens itself out, discloses itself to be necessity.

§ 144

[b] Contingency (accidents) But the Actual in its distinction from possibility (which is reflection-into-self) is only the outward concrete, the unessential immediate. In other words, to such extent as the actual is primarily the simple merely immediate unity of Inward and Outward, it is obviously made an unessential outward, and thus at the same time it is

merely inward, the abstraction of reflection-into-self. Hence it is itself characterised as a merely possible. When thus valued at the rate of a mere possibility, the actual is a Contingent or Accidental, and, conversely, possibility is mere Accident itself or Chance.

Possibility and Contingency

§ 145

Possibility and Contingency are the two factors of Actuality - Inward and Outward, put as mere forms which constitute the externality of the actual. They have their reflection-into-self on the body of actual fact, or content, with its intrinsic definitiveness which gives essential ground of their characterisation. The finitude of the contingent and the possible lies, therefore, as we now see, in the distinction of the form-determination from the content: and, therefore, it depends on the content alone whether anything is contingent and possible.

Free Will

As possibility is the mere *inside* of actuality, it is for that reason a mere *outside* actuality, in other words, Contingency. The contingent, roughly speaking, is what has the ground of its being not in itself but in somewhat else. Such is the aspect under which actuality first comes before consciousness, and which is often mistaken for actuality itself. But the contingent is only one side of the actual - the side namely, of reflection on somewhat else. It is the actual, in the signification of something merely possible. Accordingly we consider the contingent to be what may or may not be, what may be in one way or another, whose being or not-being, and whose being in this way or otherwise, depends not upon itself but on something else.

To overcome this contingency is, roughly speaking, the problem of science on the one hand; as in the range of practice, on the other, the end of action is to rise above the contingency of the will, or above caprice. It has however often happened, most of all in modern times, that contingency has been unwarrantably elevated, and has a value attached to it, both in nature and in the world of the mind, to which it has no just claim. Frequently, Nature, to take it first, has been chiefly admired for the richness and variety of its structures. Apart however from what disclosure it contains of the Idea, this richness gratifies none of the higher interests of Reason, and its vast variety of structures, organic and inorganic, affords us only the spectacle of a contingency losing itself in vagueness. At any rate, the chequered scene presented by the several varieties of animals and plants, conditioned as it is by outward circumstances - the complex changes in configuration and grouping of clouds, and the like - ought not to be ranked higher than the equally casual fancies of the mind which surrenders itself to its own caprices. The wonderment with which such phenomena are welcomed is a most abstract frame of mind, from which one should advance to a closer insight into the inner harmony and uniformity of nature.

Of contingency in respect of the Will it is especially important to form a proper estimate. The Freedom of the Will is an expression that often means mere free choice, or the will in the form of contingency. Freedom of choice, or the capacity for determining ourselves towards one thing or another, or is undoubtedly a vital element in the will (which is in its very notion free); but instead of being freedom itself, it is only in the first instance a freedom in form. The genuinely free will, which includes free choice as suspended, is conscious to itself that its content is intrinsically firm and fast, and knows it at the same time to be thoroughly its own. A will, on the contrary, which remains standing on the grade of option, even supposing it does decide in

favour of what is in import right and true, is always haunted by the conceit that it might, if it had so pleased, have decided in favour of the reverse course. When more narrowly examined, free choice is seen to be a contradiction, to this extent, that its form and content stand in antithesis. The matter of choice is given, and known as a content dependent not on the will itself, but on outward circumstances. In reference to such a given content, freedom lies only in the form of choosing, which, as it is only a freedom in form, may consequently be regarded as freedom only in supposition. On an ultimate analysis it will be seen that the same outwardness of circumstances, on which is founded the content that the will finds to its hand, can alone account for the will giving its decision for the one and not the other of the two alternatives.

Although contingency, as it has thus been shown, is only one aspect in the whole of actuality, and therefore not to be mistaken for the whole of actuality, and therefore not to be mistaken for actuality itself, it has no less than the rest of the forms of the idea its due office in the world of objects. This is, in the first place, seen in Nature. On the surface of Nature, so to speak, Chance ranges unchecked, and the contingency must simply be recognised, without the pretension sometimes erroneously ascribed to philosophy, in seeking to find it in a could-only-be-so-and-not-otherwise. Nor is contingency less visible in the world of Mind. The Will, as we have already remarked, includes contingency under the shape of option or free choice, but only as a vanishing and abrogated element. In respect of Mind and its works, just as in the case of Nature, we must guard against being so far misled by a well-meant endeavour after rational knowledge, as to try to exhibit the necessity of phenomena which are marked by a decided contingency, or, as the phrase is, to construe them *a priori*. Thus in language (although it be, as it were, the body of thought) Chance still

unquestionably plays a decided part; and the same is true of the creations of law, of art, etc.

The problem of science, and especially of philosophy, undoubtedly consists in eliciting the necessity concealed under the semblance of contingency. That, however, is far from meaning that the contingent belongs to our subjective conception alone, and must therefore be simply set aside, if we wish to get at the truth. All scientific researches which pursue this tendency exclusively lay themselves open to the charge of mere jugglery and an over-strained precisionism.

Condition

§ 146

When more closely examined, what the aforesaid outward side of actuality implies is this. Contingency, which is actuality in its immediacy, is the self-identical, essentially only as a supposition which is no sooner made than it is revoked and leaves an existent externality. In this way, the external contingency is something pre-supposed, the immediate existence of which is at the same time a possibility, and has the vocation to be suspended, to be the possibility of something else. Now this possibility is the Condition.

The Contingent, as the immediate actuality, is at the same time, the possibility of somewhat else - no longer however, the abstract possibility which we had at first, but the possibility which *is*. And a possibility existent is a Condition. By the Condition of a thing we mean first, an existence, in short an immediate, and secondly the vocation of this immediate to be suspended and subserve the actualising of something else. Immediate actuality is in general as such never what it ought to be; it is a finite actuality with an inherent flaw, and its vocation is to be consumed. But the other aspect of actuality is its essentiality. This is primarily the inside which

as a mere possibility is no less destined to be suspended. Possibility thus suspended is the issuing of a new actuality, of which the first immediate actuality was the pre-supposition. Here we see the alternation which is involved in the notion of a Condition. The Conditions of a thing seem at first sight to involve no bias any way. Really however, an immediate actuality of this kind includes in it the germ of something else altogether. At first, this something else is only a possibility: but the form of possibility is soon suspended and translated into actuality. This new actuality thus issuing is the very inside of the immediate actuality which uses it up. Thus, there comes into being quite another shape of things, and yet it is not an other: for the first actuality is only put as what it in essence was. The conditions which are sacrificed, which fall to the ground and are spent, only unite with themselves in the other actuality. Such in general is the nature of the process of actuality. The actual is no mere case of immediate Being, but, as essential Being, a suspension of its own immediacy, and thereby mediating itself with itself.

Real Possibility

§ 147

When this externality (of actuality) is thus developed into a circle of the two categories of possibility and immediate actuality, showing the intermediation of the one by the other, it is what is called Real Possibility. Being such a circle, further, it is the totality, and thus the content, the actual fact or affair in its all-round definiteness. While in like manner, if we look at the distinction between the two characteristics in this unity, it realises the concrete totality of the form, the immediate self-translation of inner into outer, and of outer into inner. This self-movement of the form is Activity, carrying into effect the fact or affair as a *real* ground which is self-

suspended to actuality, and carrying into effect the contingent actuality, the conditions, i.e. it is their reflection-into-self, and their self-suspension to another actuality of the actual fact. If all the conditions are at hand, the fact (event) *must* be actual; and the fact itself is one of the conditions: for being in the first place only inner, it is in fact itself only pre-supposed. Developed actuality, as the coincident alternation of inner and outer, the alternation of their opposite motions combined into a single motion, is Necessity.

Necessity

Necessity has been defined, and rightly so, as the union of possibility and actuality. This mode of expression, however, gives a superficial and therefore unintelligible description of the very difficult notion of necessity. It is difficult because it is the notion itself, only that its stages or factors are still as actualities, which are yet at the same time to be viewed as forms only, collapsing and transient. In the two following paragraphs, therefore, an exposition of the factors which constitute necessity must be given at greater length.

Blind Necessity

When anything is said to be necessary, the first question we ask is: Why? Anything necessary accordingly comes before us as something due to a supposition, the result of certain antecedents. If we go no further than mere derivation from antecedents, however, we have not gained a complete notion of what necessity means. What is merely derivative, is what it is, not through itself, but through something else: and in this way, it too is merely contingent. What is necessary on the other hand, we would have to be what it is through itself: and thus, although derivative, it must still contain the antecedent whence it is derived as a vanishing element in itself. Hence we say of what is necessary, ‘It is’. We thus hold it to be simple, self-relation, in which all dependence on something else is removed.

Necessity is often said to be blind. If that means that in the process of necessity the End or final cause is not explicitly and overtly present, the statement is correct. The process of necessity begins with the existence of scattered circumstances which appear to have no interconnection and no concern one with another. These circumstances are an immediate actuality which collapses, and out of this negation a new actuality proceeds. Here we have a content which in point of form is doubled, once as content of the final realised fact, and once as content of the scattered circumstances which appear as if they were positive, and make themselves at first felt in that character. The latter content is in itself nought and is accordingly inverted into its negative, thus becoming content of the realised fact. The immediate circumstances fall to the ground as conditions, but are at the same time retained as content of the ultimate reality. From such circumstances and conditions there has, as we say, proceeded quite another thing, and it is for that reason that we call this process of necessity blind. If on the contrary we consider teleological action, we have in the end of action a content which is already foreknown. This activity therefore is not blind but seeing. To say that the world is ruled by Providence implies that design, as what has been absolutely predetermined, is the active principle, so that the issue corresponds to what has been fore-known and forewilled.

The theory however which regards the world as determined through necessity and the belief in a divine providence are by no means mutually excluding points of view. The intellectual principle underlying the idea of divine providence will hereafter be shown to be the notion. But the notion is the truth of necessity, which it contains in suspension in itself; just as, conversely, necessity is the notion implicit. Necessity is blind only so long as it is not understood. There is nothing therefore more mistaken than the charge of blind fatalism made against the Philosophy of History, when it takes for its problem to understand the necessity of every event. The

philosophy of history rightly understood takes the rank of a Theodicee; and those, who fancy they honour Divine Providence by excluding necessity from it, are really degrading it by this exclusiveness to a blind and irrational caprice. In the simple language of the religious mind which speaks of God's eternal and immutable decrees, there is implied an express recognition that necessity forms part of the essence of God. In his difference from God, man, with his own private opinion and will, follows the call of caprice and arbitrary humour, and thus often finds his acts turn out something quite different from what he had meant and willed. But God knows what he wills, is determined in his eternal will neither by accident from within nor from without, and what he wills he also accomplishes, irresistibly.

Necessity gives a point of view which has important bearings upon our sentiments and behaviour. When we look upon events as necessary, our situation seems at first sight to lack freedom completely. In the creed of the ancients, as we know, necessity figured as Destiny. The modern point of view, on the contrary, is that of Consolation. And Consolation means that, if we renounce our aims and interests, we do so only in prospect of receiving compensation. Destiny, on the contrary, leaves no room for Consolation. But a close examination of the ancient feeling about destiny will not by any means reveal a sense of bondage to its power. Rather the reverse. This will clearly appear, if we remember that the sense of bondage springs from inability to surmount the antithesis, and from looking at what is, and what happens, as contradictory to what ought to be and happen. In the ancient mind the feeling was more of the following kind: Because such a thing is, it is, and as it is, so ought it to be. Here there is no contrast to be seen, and therefore no sense of bondage, no pain, and no sorrow. True, indeed, as already remarked, this attitude towards destiny is void of consolation. But then, on the other hand, it is a frame of mind which does not need consolation, so long as personal subjectivity has not acquired its infinite

significance. It is this point on which special stress should be laid in comparing the ancient sentiment with that of the modern and Christian world.

By Subjectivity, however, we may understand, in the first place, only the natural and finite subjectivity, with its contingent and arbitrary content of private interests and inclinations — all, in short, that we call person as distinguished from thing: taking ‘thing’ in the emphatic sense of the word (in which we use the (correct) expression that it is a question of things and not of persons). In this sense of subjectivity we cannot help admiring the tranquil resignation of the ancients to destiny, and feeling that it is a much higher and worthier mood than that of the moderns, who obstinately pursue their subjective aims, and when they find themselves constrained to resign the hope of reaching them, console themselves with the prospect of a reward in some other shape. But the term subjectivity is not to be confined merely to the bad and finite kind of it which is contrasted with the thing (fact). In its truth subjectivity is immanent in the fact, and as a subjectivity thus infinite is the very truth of the fact. Thus regarded, the doctrine of consolation receives a newer and a higher significance. It is in this sense that the Christian religion is to be regarded as the religion of consolation, and even of absolute consolation. Christianity, we know, teaches that God wishes all men to be saved. That teaching declares that subjectivity has an infinite value. And that consoling power of Christianity just lies in the fact that God himself is in it known as the absolute subjectivity, so that, inasmuch as subjectivity involves the element of particularity, our particular personality too is recognised not merely as something to be solely and simply nullified, but as at the same time something to be preserved. The gods of the ancient world were also, it is true, looked upon as personal; but the personality of a Zeus and an Apollo is not a real personality: it is only a figure in the mind. In other words, these gods are mere personifications,

which, being such, do not know themselves, and are only known. An evidence of this defect and this powerlessness of the old gods is found even in the religious beliefs of antiquity. In the ancient creeds not only men, but even gods, were represented as subject to destiny, a destiny which we must conceive as necessity not unveiled, and thus as something wholly impersonal, selfless, and blind. On the other hand, the Christian God is God not known merely but also self-knowing; he is a personality not merely figured in our minds, but rather absolutely actual.

We must refer to the Philosophy of Religion for a further discussion of the points here touched. But we may note in passing how important it is for any man to meet everything that befalls him with the spirit of the old proverb which describes each man as the architect of his own fortune That means that it is only himself after all of which a man has the usufruct. The other way would be to lay the blame of whatever we experience upon other men, upon unfavourable circumstances, and the like. And this is a fresh example of the language of unfreedom, and at the same time the spring of discontent. If man saw, on the contrary, that whatever happens to him is only the outcome of himself, and that he only bears his own guilt, he would stand free, and in everything that came upon him would have the consciousness that he suffered no wrong. A man who lives in dispeace with himself and his lot commits much that is perverse and amiss, for no other reason than because of the false opinion that he is wronged by others. No doubt too there is a great deal of chance in what befalls us. But the chance has its root in the ‘natural’ man. So long however as a man is otherwise conscious that he is free, his harmony of soul and peace of mind will not be destroyed by the disagreeables that befall him. It is their view of necessity, therefore, which is at the root of the discontent of men, and which in that way determines their destiny itself.

The Process of Necessity

§ 148

Among the three elements in the process of necessity, the Condition, the Fact, and the Activity:

a. The Condition is [a] what is presupposed or ante-stated, i.e. it is not only supposed or stated, and so only a correlative to the fact, but also prior, and so independent, a contingent and external circumstance which exists without respect to the fact. While thus contingent, however, this presupposed or ante-stated term, in respect withal of the fact, which is the totality, is a complete circle of conditions. [b] The conditions are passive, and used as materials for the fact, into the content of which they thus enter. They are likewise intrinsically conformable to this content, and already contain its whole characteristic.

b. The Fact is also [a] something presupposed or ante-stated, i.e. it is at first, and as supposed, only inner and possible, and also, being prior, as independent content by itself. [b] By using up the conditions, it receives its external existence, the realisation of the articles of its content, which reciprocally correspond to the conditions, so that while it presents itself out of these as the facts, it also proceeds from them.

c. The Activity similarly has [a] an independent existence of its own (as man, a character), and at the same time it is possible only where the conditions are and the fact. [b] It is the movement which translates the conditions into fact, and the latter into the former as the side of existence, or rather the movement which educes the fact from the conditions in which it is potentially present, and which gives existence to the fact by abolishing the existence possessed by the conditions.

In so far as these three elements stand to each other in the shape of independent existences, this process has the aspect of an outward necessity. Outward necessity has a limited content for its fact. For the fact is this whole, in phase of singleness. But since in its form this whole is external to

itself, it is self-externalised even in its own self and in its content, and this externality, attaching to the fact, is a limit of its content.

The Circle of Circumstances

§ 149

Necessity, then, is potentially the one essence, self-same, but not full of content, in the reflected light of which its distinctions take the form of independent realities. This self-sameness is at the same time, as absolute form, the activity which reduces into dependency and mediates into immediacy. Whatever is necessary is through another, which is broken up into mediating ground (the Fact and the Activity) and an immediate actuality, or accidental circumstance, which is at the same time a Condition. The necessary, being through an other, is not in and for itself: hypothetical, it is a mere result of assumption. But this intermediation is just as immediate however as the abrogation of itself. The ground and contingent condition is translated into immediacy, by which that dependency is now lifted up into actuality, and the fact has closed with itself. In this return to itself, the necessary simply and positively *is*, as unconditioned actuality. The necessary is so, mediated through a circle of circumstances: it is so, because the circumstances are so, and at the same time it is so, unmediated: it is so, because it is.

(a) The Relationship of Substantiality

§ 150

The necessary is in itself an absolute correlation of elements, i.e. the process developed (in the preceding paragraphs), in which the correlation also suspends itself to absolute identity.

In its immediate form it is the relationship of Substance and Accident. The absolute self-identity of this relationship is Substance as such, which as necessity gives the negative to this form of inwardness, and thus invests itself with actuality, but which also gives the negative to this outward thing. In this negativity, the actual, as immediate, is only an accidental which through this bare possibility passes over into another actuality. This transition is the identity of substance, regarded as form-activity.

Substance

§ 151

Substance is accordingly the totality of the Accidents, revealing itself in them as their absolute negativity (that is to say, as absolute power) and at the same time as the wealth of all content. This content however is nothing but that very revelation, since the character (being reflected in itself to make content) is only a passing stage of the form which passes away in the power of substance. Substantiality is the absolute form-activity and the power of necessity: all content is but a vanishing element which merely belongs to this position, where there is an absolute revulsion of form and content into one another.

In the history of philosophy we meet with Substance as the principle of Spinoza's system. On the import and value of this much-praised and no-less decried philosophy there has been great misunderstanding and a deal of talking since the days of Spinoza. The atheism, and as a further charge, the pantheism of the system has formed the commonest ground of accusation. These cries arise because of Spinoza's conception of God as substance, and substance only. What we are to think of this charge follows, in the first instance, from the place which substance takes in the system of the logical idea. Though an essential stage in the evolution of the idea, substance is not

the same with absolute idea, but the idea under the still limited form of necessity.

It is true that God is necessity, or, as we may also put it, that he is the absolute Thing: he is however no less the absolute Person. That he is the absolute Person however is a point which the philosophy of Spinoza never reached: and on that side it falls short of the true notion of God which forms the content of religious consciousness in Christianity. Spinoza was by descent a Jew; and it is upon the whole the Oriental way of seeing things, according to which the nature of the finite world seems frail and transient, that has found its intellectual expression in his system. This Oriental view of the unity of substance certainly gives the basis for all real further development. Still it is not the final idea. It is marked by the absence of the principle of the Western world, the principle of individuality, which first appeared under a philosophic shape, contemporaneously with Spinoza, in the Monadology of Leibnitz.

From this point we glance back to the alleged atheism of Spinoza. The charge will be seen to be unfounded if we remember that his system, instead of denying God, rather recognises that he alone really is. Nor can it be maintained that the God of Spinoza, although he is described as alone true, is not the true God, and therefore as good as no God. If that were a just charge, it would only prove that all other systems, where speculation has not gone beyond a subordinate stage of the idea — that the Jews and Mohammedans who know God only as the Lord — and that even the many Christians for whom God is merely the most high, unknowable, and transcendent being, are as much atheists as Spinoza. The so-called atheism of Spinoza is merely an exaggeration of the fact that he defrauds the principle of difference or finitude of its due. Hence his system, as it holds that there is properly speaking no world, at any rate that the world has no

positive being, should rather be styled Acosmism. These considerations will also show what is to be said of the charge of Pantheism. If Pantheism means, as it often does, the doctrine which takes finite things in their finitude and in the complex of them to be God, we must acquit the system of Spinoza of the crime of Pantheism. For in that system, finite things and the world as a whole are denied all truth. On the other hand, the philosophy which is Acosmism is for that reason certainly pantheistic.

The shortcoming thus acknowledged to attach to the content turns out at the same time to be a shortcoming in respect of form. Spinoza puts substance at the head of his system, and defines it to be the unity of thought and extension, without demonstrating how he gets to this distinction, or how he traces it back to the unity of substance. The further treatment of the subject proceeds in what is called the mathematical method. Definitions and axioms are first laid down: after them comes a series of theorems, which are proved by an analytical reduction of them to these unproved postulates. Although the system of Spinoza, and that even by those who altogether reject its contents and results, is praised for the strict sequence of its method, such unqualified praise of the form is as little justified as an unqualified rejection of the content. The defect of the content is that the form is not known as immanent in it, and therefore only approaches it as an outer and subjective form. As intuitively accepted by Spinoza without a previous mediation by dialectic, Substance, as the universal negative power, is as it were a dark shapeless abyss which engulfs all definite content as radically null, and produces from itself nothing that has a positive subsistence of its own.

§ 152

At the stage where substance, as absolute power, is the self-relating power (itself a merely inner possibility), which thus determines itself to

accidentality — from which power the externality it thereby creates is distinguished — necessity is a correlation strictly so called, just as in the first form of necessity it is substance. This is the correlation of Causality.

(b) The Relationship of Causality

§ 153

Substance is Cause, in so far as substance reflects into self as against its passage into accidentality and so stands as the *primary* fact, but again no less suspends this reflection-into-self (its bare possibility), lays itself down as the negative of itself, and thus produces an Effect, an actuality, which, though so far only assumed as a sequence, is through the process that effectuates it at the same time necessary.

As primary fact, the cause is qualified as having absolute independence, and a subsistence maintained in face of the effect: but in the necessity, whose identity constitutes that primariness itself, it is wholly passed into the effect. So far again as we can speak of a definite content, there is no content that is not in the cause. That identity in fact is the absolute content itself: but it is no less also the form-characteristic. The primariness of the cause is suspended in the effect in which the cause makes itself a dependent being. The cause however does not for that reason vanish and leave the effect to be alone actual. For this dependency is in like manner directly suspended, and is rather the reflection of the cause in itself, its primariness: in short, it is in the effect that the cause first becomes actual and a cause. The cause consequently is in its full truth *causa sui*. Jacobi, sticking to the partial conception of mediation (in his *Letters on Spinoza*), has treated the *causa sui* (and the *effectus sui* is the same), which is the absolute truth of the cause, as a mere formalism. He has also made the remark that God ought to be defined not as the ground of things, but essentially as cause. A more

thorough consideration of the nature of cause would have shown that Jacobi did not by this means gain what he intended. Even in the finite cause and its conception we can see this identity between cause and effect in point of content. The rain (the cause) and the wet (the effect) are the self-same existing water. In point of form the cause (rain) is dissipated or lost in the effect (wet): but in that case the result can no longer be described as effect; for without the cause it is nothing, and we should have only the unrelated wet left.

In the common acceptation of the causal relation the cause is finite, to such extent as its content is so (as is the case with finite substance), and so far as cause and effect are conceived as two several independent existences: which they are, however, only when we leave the causal relation out of sight. In the finite sphere we never get over the difference of the form-characteristics in their relation: and hence we turn the matter around and define the cause also as something dependent or as an effect. This again has another cause, and thus there grows up a progress from effects to causes *ad infinitum*. There is a descending progress too: the effect, looked at in its identity with the cause, is itself defined as a cause, and at the same time as another cause, which again has other effects, and so on for ever.

The way understanding bristles up against the idea of substance is equalled by its readiness to use the relation of cause and effect. Whenever it is proposed to view any sum of facts as necessary, it is especially the relation of causality to which the reflective understanding makes a point of tracing of it back. Now, although this relation does undoubtedly belong to necessity, it forms only one aspect in the process of that category. That process equally requires the suspension of the mediation involved in causality and the exhibition of it as simple self-relation. If we stick to causality as such, we have it not in its truth. Such a causality is merely finite, and its finitude lies in retaining the distinction between cause and

effect unassimilated. But these two terms, if they are distinct, are also identical. Even in ordinary consciousness that identity may be found. We say that a cause is a cause, only where it has an effect, and vice versa. Both cause and effect are thus one and the same content: and the distinction between them is primarily only that the one lays down, and the other is laid down. This formal difference however again suspends itself, because the cause is not only a cause of something else, but also a cause of itself; while the effect is not only an effect of something else, but also an effect of itself. The finitude of things consists accordingly in this. While cause and effect are in their motion identical, the two forms present themselves severed so that, though the cause is also an effect, and the effect also a cause, the cause is not an effect in the same connection as it is an effect. This again gives the infinite progress, in the shape of an endless series of causes, which shows itself at the same time as an endless series of effects.

Action and Reaction

§ 154

The effect is different from the cause. The former as such has a being dependent on the latter. But such a dependence is likewise reflection-into-self and immediacy: and the action of the cause, as it constitutes the effect, is at the same time the pre-constitution of the effect, so long as effect is kept separate from cause. There is already in existence another substance on which the effect takes place. As immediate, this substance is not a self-related negativity and active, but passive. Yet it is a substance, and it is therefore active also: it therefore suspends the immediacy it was originally put forward with, and the effect which was put into it: it reacts, i.e. suspends the activity of the first substance. But this first substance also in the same way sets aside its own immediacy, or the effect which is put into it; it thus

suspends the activity of the other substance and reacts. In this manner causality passes into the relation of Action and Reaction, or Reciprocity.

In Reciprocity, although causality is not yet invested with its true characteristic, the rectilinear movement out from causes to effects, and from effects to causes, is bent round and back into Itself, and thus the progress *ad infinitum* of causes and effects is, as a progress, really and truly suspended. This bend, which transforms the infinite progression into a self-contained relationship, here as always the plain reflection that in the above meaningless repetition there is only one and the same thing, viz. one cause and another, and their connection with one another. Reciprocity — which is the development of this relation — itself however only distinguishes turn and turn about — not causes, but factors of causation, in each of which, just because they are inseparable (on the principle of the identity that the cause is cause in the effect, and vice versa), the other factor is also equally supposed.

(c) Reciprocity, or Action & Reaction

§ 155

The characteristics which in Reciprocal Action are retained as distinct are [a] potentially the same. The one side is a cause, is primary, active, passive, etc., just as the other is. Similarly the presupposition of another side and the action upon it, the immediate primariness and the dependence produced by the alternation, are one and the same on both sides. The cause assumed to be first is on account of its immediacy passive, a dependent being, and an effect. The distinction of the causes spoken of as two is accordingly void: and properly speaking there is only one cause, which, while it suspends itself (as substance) in its effect, also rises in this operation only to independent existence as a cause.

§ 156

But this unity of the double cause is also [b] actual. All this alternation is properly the cause in act of constituting itself and in such constitution lies its being. The nullity of the distinctions is not only potential, or a reflection of ours (§ 155). Reciprocal action just means that each characteristic we impose is also to be suspended and inverted into its opposite, and that in this way the essential nullity of the 'moments' is explicitly stated. An effect is introduced into the primariness; in other words, the primariness is abolished: the action of a cause becomes reaction and so on.

Reciprocal action realises the causal relation in its complete development. It is this relation, therefore, in which reflection usually takes shelter when the conviction grows that things can no longer be studied satisfactorily from a causal point of view, on account of the infinite progress already spoken of. Thus in historical research the question may be raised in a first form, whether the character and manners of a nation are the cause of its constitution and its laws, or if they are not rather the effect. Then, as the second step, the character and manners on one side and the Constitution and laws on the other are conceived on the principle of reciprocity: and in that case the cause in the same connection as it is a cause will at the same time be an effect, and vice versa.

The same thing is done in the study of Nature, and especially of living organisms. There the sexual organs and functions are similarly seen to stand to each other in the relation of reciprocity.

Reciprocity is undoubtedly the proximate truth of the relation of cause and effect, and stands, so to say, on the threshold of the notion; but on that very ground, supposing that our aim is a thoroughly comprehensive idea, we should not rest content with applying this relation. If we get no further than studying a given content under the point of view of reciprocity, we are taking up an attitude which leaves matters utterly incomprehensible. We are

left with a mere dry fact; and the call for mediation, which is the chief motive in applying the relation of causality, is still unanswered. And if we look more narrowly into the dissatisfaction felt in applying the relation of reciprocity, we shall see that it consists in the circumstance that this relation, instead of being treated as an equivalent for the notion, ought, first of all, to be known and understood in its own nature. And to understand the relation of action we must not let the two sides rest in their state of mere given facts, but recognise them, as has been shown in the two paragraphs preceding, for factors of a third and higher, which is the notion and nothing else.

To make, for example, the manners of the Spartans the cause of their constitution and their constitution conversely the cause of their manners, may no doubt be in a way correct. But, as we have comprehended neither the manners nor the constitution of the nation, the result of such reflections can never be final or satisfactory. The satisfactory point will be reached only when these two, as well as all other, special aspects of Spartan life and Spartan history are seen to be founded in this notion.

Necessity

§ 157

This pure self-reciprocation is therefore Necessity unveiled or realised. The link of necessity *qua* necessity is identity, as still inward and concealed, because it is the identity of what are esteemed actual things, although their very self-subsistence is bound to be necessity. The circulation of substance through causality and reciprocity therefore only expressly makes out or states that self-subsistence is the infinite negative self-relation — a relation *negative* in general, for in it the act of distinguishing and intermediating becomes a primariness of actual things independent one against the other —

and *infinite self-relation*, because their independence only lies in their identity.

Freedom

§ 158

The truth of necessity is, therefore, Freedom: and the truth of substance is the Notion - an independence which, though self-repulsive into distinct independent elements, yet in that repulsion is self-identical, and in the movement of reciprocity still at home and conversant only with itself.

Freedom and Necessity

Necessity is often called hard, and rightly so, if we keep to necessity as such, i.e. to its immediate shape. Here we have, first of all, some state or, generally speaking, fact, possessing an independent subsistence: and necessity primarily implies that there falls upon such a fact something else by which it is brought low. This is what is hard and sad in necessity immediate or abstract. The identity of the two things, which necessity presents as bound to each other and thus bereft of their independence, is at first only inward, and therefore has no existence for those under the yoke of necessity. Freedom too from this point of view is only abstract, and is preserved only by renouncing all that we immediately are and have. But, as we have already seen, the process of necessity is so directed that it overcomes the rigid externality which it first had and reveals its inward nature. It then appears that the members, linked to one another, are not really foreign to each other, but only elements of one whole, each of them, in its connection with the other, being, as it were, at home, and combining with itself. In this way, necessity is transfigured into freedom - not the freedom that consists in abstract negation, but freedom concrete and positive. From which we may learn what a mistake it is to regard freedom

and necessity as mutually exclusive. Necessity indeed, *qua* necessity, is far from being freedom: yet freedom presupposes necessity, and contains it as an unsubstantial element in itself.

A good man is aware that the tenor of his conduct is essentially obligatory and necessary. But this consciousness is so far from making any abatement from his freedom, that without it, real and reasonable freedom could not be distinguished from arbitrary choice - a freedom which has no reality and is merely potential. A criminal, when punished, may look upon his punishment as a restriction of his freedom. Really the punishment is not a foreign constraint to which he is subjected, but the manifestation of his own act. In short, man is most independent when he knows himself to be determined by the absolute idea throughout. It was this phase of mind and conduct which Spinoza called *Amor intellectualis Dei*.

§ 159

Thus the Notion is the truth of Being and Essence, inasmuch as the shining or show of self-reflection is itself at the same time independent immediacy, and this being of a different actuality is immediately only a shining or show on itself.

The Notion has exhibited itself as the truth of Being and Essence as the ground to which the regress of both leads. Conversely it has been developed out of being as its ground. The former aspect of the advance may be regarded as a concentration of being into its depth, thereby disclosing its inner nature: the latter aspect as an issuing of the more perfect from the less perfect. When such development is viewed on the latter side only, it does prejudice to the method of philosophy. The special meaning which these superficial thoughts of more imperfect and more perfect have in this place is to indicate the distinction of being, as an immediate unity with itself, from the notion, as free mediation with itself. Since being has shown that it is an

element in the notion, the latter has thus exhibited itself as the truth of being. As this its reflection in itself and as an absorption of the mediation, the notion is the pre-supposition of the immediate — a presupposition which is identical with the return to self; and in this identity lie freedom and the notion. If the partial element therefore be called the imperfect, then the notion, or the perfect, is certainly a development from the imperfect; since its very nature is thus to suspend its pre-supposition. At the same time it is the notion alone which, in the act of supposing itself, makes its presupposition; as has been made apparent in causality in general and especially in reciprocal action.

Thus in reference to Being and Essence the Notion is defined as Essence reverted to the simple immediacy of Being — the shining or show of Essence thereby having actuality, and its actuality being at the same time a free shining or show in itself. In this manner the notion has being as its simple self-relation, or as the immediacy of its immanent unity. Being is so poor a category that it is the least thing which can be shown to be found in the notion. The passage from necessity to freedom, or from actuality into the notion, is the very hardest, because it proposes that independent actuality shall be thought as having all its substantiality in the passing over and identity with the other independent actuality. The notion, too, is extremely hard, because it is itself just this very identity. But the actual substance as such, the cause, which in its exclusiveness resists all invasion, is ipso facto subjected to necessity or the destiny of passing into dependency: and it is this subjection rather where the chief hardness lies. To think necessity, on the contrary, rather tends to melt that hardness. For thinking means that, in the other, one meets with one's self. It means a liberation, which is not the flight of abstraction, but consists in that which is actual having itself not as something else, but as its own being and creation, in the other actuality with which it is bound up by the force of necessity. As

existing in an individual form, this liberation is called I: as developed to its totality, it is free Spirit; as feeling, it is Love; and as enjoyment, it is Blessedness. The great vision of substance in Spinoza is only a potential liberation from finite exclusiveness and egotism: but the notion itself realises for its own both the power of necessity and actual freedom.

When, as now, the notion is called the truth of Being and Essence, we must expect to be asked, why do we not begin with the notion? The answer is that, where knowledge by thought is our aim, we cannot begin with the truth, because the truth, when it forms the beginning, must rest on mere assertion. The truth when it is thought must as such verify itself to thought. If the notion were put at the head of Logic, and defined, quite correctly in point of content, as the unity of Being and Essence, the following question would come up: What are we to think under the terms 'Being' and 'Essence', and how do they come to be embraced in the unity of the Notion? But if we answered these questions, then our beginning with the notion would merely be nominal. The real start would be made with Being, as we have here done: with this difference, that the characteristics of Being as well as those of Essence would have to be accepted uncritically from figurate conception, whereas we have observed Being and Essence in their own dialectical development and learnt how they lose themselves in the unity of the notion.

Third Subdivision

IX. The Notion

§ 160

THE NOTION IS the principle of freedom, the power of substance self-realised. It is a systematic whole, in which each of its constituent functions is the very total which the notion is, and is put as indissolubly one with it. Thus in its self-identity it has original and complete determinateness.

The position taken up by the notion is that of absolute idealism. Philosophy is a knowledge through notions because it sees that what on other grades of consciousness is taken to have Being, and to be naturally or immediately independent, is but a constituent stage in the Idea. In the logic of understanding, the notion is generally reckoned a mere form of thought, and treated as a general conception. It is to this inferior view of the notion that the assertion refers, so often urged on behalf of the heart and sentiment, that notions as such are something dead, empty, and abstract. The case is really quite the reverse.

The notion is, on the contrary, the principle of all life, and thus possesses at the same time a character of thorough concreteness. That it is so follows from the whole logical movement up to this point, and need not be here proved. The contrast between form and content, which is thus used to criticise the notion when it is alleged to be merely formal, has, like all the other contrasts upheld by reflection, been already left behind and overcome dialectically or through itself. The notion, in short, is what contains all the earlier categories of thought merged in it. It certainly is a form, but an infinite and creative form which includes, but at the same time releases from itself, the fullness of all content. And so too the notion may, if it be

wished, be styled abstract, if the name concrete is restricted to the concrete facts of sense or of immediate perception. For the notion is not palpable to the touch, and when we are engaged with it, hearing and seeing must quite fail us. And yet, as it was before remarked, the notion is a true concrete; for the reason that it involves Being and Essence, and the total wealth of these two spheres with them, merged in the unity of thought.

If, as was said at an earlier point, the different stages of the logical idea are to be treated as a series of definitions of the Absolute, the definition which now results for us is that the Absolute is the Notion. That necessitates a higher estimate of the notion, however, than is found in formal conceptualist Logic, where the notion is a mere form of our subjective thought, with no original content of its own. But if Speculative Logic thus attaches a meaning to the term notion so very different from that usually given, it may be asked why the same word should be employed in two contrary acceptations, and an occasion thus given for confusion and misconception. The answer is that, great as the interval is between the speculative notion and the notion of Formal Logic, a closer examination shows that the deeper meaning is not so foreign to the general usages of language as it seems at first sight. We speak of the deduction of a content from the notion, e.g. of the specific provisions of the law of property from the notion of property; and so again we speak of tracing back these material details to the notion. We thus recognise that the notion is no mere form without a content of its own: for if it were, there would be in the one case nothing to deduce from such a form, and in the other case to trace a given body of fact back to the empty form of the notion would only rob the fact of its specific character, without making it understood.

Development

§ 161

The onward movement of the notion is no longer either a transition into, or a reflection on something else, but Development. For in the notion, the elements distinguished are without more ado at the same time declared to be identical with one another and with the whole, and the specific character of each is a free being of the whole notion.

Transition into something else is the dialectical process within the range of Being: reflection (bringing something else into light), in the range of Essence. The movement of the Notion is development: by which that only is explicit which is already implicitly present. In the world of nature it is organic life that corresponds to the grade of the notion. Thus e.g. the plant is developed from its germ. The germ virtually involves the whole plant, but does so only ideally or in thought: and it would therefore be a mistake to regard the development of the root, stem, leaves, and other different parts of the plant, as meaning that they were *realiter* present, but in a very minute form, in the germ. That is the so-called 'box-within-box' hypothesis; a theory which commits the mistake of supposing an actual existence of what is at first found only as a postulate of the completed thought. The truth of the hypothesis on the other hand lies in its perceiving that in the process of development the notion keeps to itself and only gives rise to alteration of form, without making any addition in point of content. It is this nature of the notion — this manifestation of itself in its process as a development of its own self which is chiefly in view with those who speak of innate ideas, or who, like Plato, describe all learning merely as reminiscence. Of course that again does not mean that everything which is embodied in a mind, after that mind has been formed by instructions had been present in that mind beforehand, in its definitely expanded shape.

The movement of the notion is as it were to be looked upon merely as plan: the other which it sets up is in reality not an other. Or, as it is

expressed in the teaching of Christianity: not merely has God created a World which confronts him as an other; he has also from all eternity begotten a Son in whom he, a Spirit, is at home with himself.

§ 162

The doctrine of the notion is divided into three parts.

(1) The first is the doctrine of the Subjective or Formal Notion.

(2) The second is the doctrine of the notion invested with the character of immediacy, or of Objectivity.

(3) The third is the doctrine of the Idea, the subject-object, the unity of notion and objectivity, the absolute truth.

The Common Logic covers only the matters which come before us here as a portion of the third part of the whole system, together with the so-called Laws of Thought, which we have already met; and in the Applied Logic it adds a little about cognition. This is combined with psychological, metaphysical, and all sorts of empirical materials, which were introduced because, when all was done, those forms of thought could not be made to do all that was required of them. But with these additions the science lost its unity of aim. Then there was a further circumstance against the Common Logic. Those forms, which at least do belong to the proper domain of Logic, are supposed to be categories of conscious thought only, of thought too in the character of understanding, not of reason.

The preceding logical categories, those viz. of Being and Essence, are, it is true, no mere logical modes or entities: they are proved to be notions in their transition or their dialectical element, and in their return into themselves and totality. But they are only in a modified form notions (cf. § § 84 and 112), notions rudimentary, or, what is the same thing, notions for us. The antithetical term into which each category passes, or in which it shines, so producing correlation, is not characterised as a particular. The

third, in which they return to unity, is not characterised as a subject or an individual: nor is there any explicit statement that the category is identical in its antithesis — in other words, its freedom is not expressly stated: and all this because the category is not universality. What generally passes current under the name of a notion is a mode of understanding, or even a mere general representation, and therefore, in short, a finite mode of thought (cf. § 62).

The Logic of the Notion is usually treated as a science of form only, and understood to deal with the form of notion, judgment, and syllogism as form, without in the least touching the question whether anything is true. The answer to that question is supposed to depend on the content only. If the logical forms of the notion were really dead and inert receptacles of conceptions and thoughts, careless of what they contained, knowledge about them would be an idle curiosity which the truth might dispense with. On the contrary they really are, as forms of the notion, the vital spirit of the actual world. That only is true of the actual which is true in virtue of these forms, through them and in them. As yet, however, the truth of these forms has never been considered or examined on their own account any more than their necessary interconnection.

A. THE SUBJECTIVE NOTION

Development of the Subjective Notion
Notion - Judgment - Syllogism

(a) The Notion as Notion

§ 163

The Notion as Notion contains the three following ‘moments’ or functional parts.

(1) The first is Universality — meaning that it is in free equality with itself in its specific character.

(2) The second is Particularity — that is, the specific character, in which the universal continues serenely equal to itself.

(3) The third is Individuality — meaning the reflection-into-self of the specific characters of universality and particularity; which negative self-unity has complete and original determinateness, without any loss to its self-identity or universality.

Individual and actual are the same thing: only the former has issued from the notion, and is thus, as a universal, stated expressly as a negative identity with itself. The actual, because it is at first no more than a potential or immediate unity of essence or existence, *may* possibly have effect: but the individuality of the notion is the very source of effectiveness, effective moreover no longer as the cause is, with a show of effecting something else, but effective of itself. Individuality, however, is not to be understood to mean the immediate or natural individual, as when we speak of individual things or individual men: for that special phase of individuality does not appear till we come to the judgment. Every function and ‘moment’ of the notion is itself the whole notion (§ 160); but the individual or subject is the notion expressly put as a totality.

(1) The notion is generally associated in our minds with abstract generality, and on that account it is often described as a general conception. We speak, accordingly, of the notions of colour, plant, animal, etc. They are supposed to be arrived at by neglecting the particular features which distinguish the different colours, plants, and animals from each other, and by retaining those common to them all. This is the aspect of the notion which is familiar to understanding; and feeling is in the right when it

stigmatises such hollow and empty notions as mere phantoms and shadows. But the universal of the notion is not a mere sum of features common to several things, confronted by a particular which enjoys an existence of its own. It is, on the contrary, self-particularising or self-specifying, and with undimmed clearness finds itself at home in its antithesis. For the sake both of cognition and of our practical conduct, it is of the utmost importance that the real universal should not be confused with what is merely held in common. All those charges which the devotees of feeling make against thought, and especially against philosophic thought, and the reiterated statement that is dangerous to carry thought to what they call too great lengths, originate in the confusion of these two things.

The universal in its true and comprehensive meaning is a thought which, as we know, cost thousands of years to make it enter into the consciousness of men. The thought did not gain its full recognition till the days of Christianity. The Greeks, in other respects so advanced, knew neither God nor even man in their true universality. The gods of the Greeks were only particular powers of the mind; and the universal God, the God of all nations, was to the Athenians still a God concealed. They believed in the same way that an absolute gulf separated themselves from the barbarians. Man as man was not then recognised to be of infinite worth and to have infinite rights. The question has been asked, why slavery has vanished from modern Europe. One special circumstance after another has been adduced in explanation of this phenomenon. But the real ground why there are no more slaves in Christian Europe is only to be found in the very principle of Christianity itself, the religion of absolute freedom. Only in Christendom is man respected as man, in his infinitude and universality. What the slave is without, is the recognition that he is a person: and the principle of personality is universality. The master looks upon his slave not as a person,

but as a selfless thing. The slave is not himself reckoned an ‘I’ — his ‘I’ is his master.

The distinction referred to above between what is merely in common, and what is truly universal, is strikingly expressed by Rousseau in his famous *Contrat social*, when he says that the laws of a state must spring from the universal will (*volonte generale*), but need not on that account be the will of all (*volonte de tous*). Rousseau would have made a sounder contribution towards a theory of the state, if he had always kept this distinction in sight. The general will is the notion of the will: and the laws are the special clauses of this will and based upon the notion of it.

(2) We add a remark upon the account of the origin and formation of notions which is usually given in the Logic of Understanding. It is not we who frame the notions. The notion is not something which is originated at all. No doubt the notion is not mere Being, or the immediate: it involves mediation, but the mediation lies in itself. In other words, the notion is what is mediated through itself and with itself. It is a mistake to imagine that the objects which form the content of our mental ideas come first and that our subjective agency then supervenes, and by the aforesaid operation of abstraction, and by colligating the points possessed in common by the objects, frames notions of them. Rather the notion is the genuine first; and things are what they are through the action of the notion, immanent in them, and revealing itself in them. In religious language we express this by saying that God created the world out of nothing. In other words, the world and finite things have issued from the fullness of the divine thoughts and the divine decrees. Thus religion recognises thought and (more exactly) the notion to be the infinite form, or the free creative activity, which can realise itself without the help of a matter that exists outside it.

§ 164

The notion is concrete out and out: because the negative unity with itself, as characterisation pure and entire, which is individuality, is just what constitutes its self-relation, its universality. The functions or ‘moments’ of the notion are to this extent indissoluble. The categories of ‘reflection’ are expected to be severally apprehended and separately accepted as current, apart from their opposites. But in the notion, where their identity is expressly assumed, each of its functions can be immediately apprehended only from and with the rest.

Universality, particularity, and individuality are, taken in the abstract, the same as identity, difference, and ground. But the universal is the self-identical, with the express qualification, that it simultaneously contains the particular and the individual. Again, the particular is the different or the specific character, but with the qualification that it is in itself universal and is as an individual. Similarly the individual must be understood to be a subject or substratum, which involves the genus and species in itself and possesses a substantial existence. Such is the explicit or realised inseparability of the functions of the notion in their difference (§ 160) — what may be called the clearness of the notion, in which each distinction causes no dimness or interruption, but is quite as much transparent.

No complaint is oftener made against the notion than that it is *abstract*. Of course it is abstract, if abstract means that the medium in which the notion exists is thought in general and not the sensible thing in its empirical concreteness. It is abstract also, because the notion falls short of the idea. To this extent the subjective notion is still formal. This however does not mean that it ought to have or receive another content than its own. It is itself the absolute form, and so is all specific character, but as that character is in its truth. Although it be abstract therefore, it is the concrete, concrete altogether, the subject as such. The absolutely concrete is the mind (see end of § 159) — the notion when it exists as notion distinguishing itself from its

objectivity, which notwithstanding the distinction still continues to be its own. Everything else which is concrete, however rich it be, is not so intensely identical with itself and therefore not so concrete on its own part — least of all what is commonly supposed to be concrete, but is only a congeries held together by external influence. What are called notions, and in fact specific notions, such as man, house, animal, etc., are simply denotations and abstract representations. These abstractions retain out of all the functions of the notion only that of universality; they leave particularity and individuality out of account and have no development in these directions. By so doing they just miss the notion.

§ 165

It is the element of Individuality which first explicitly differentiates the elements of the notion. Individuality is the negative reflection of the notion into itself, and it is in that way at first the free differentiating of it as the first negation, by which the specific character of the notion is realised, but under the form of particularity. That is to say, the different elements are in the first place only qualified as the several elements of the notion, and, secondly, their identity is no less explicitly stated, the one being said to be the other. This realised particularity of the notion is the Judgment.

The ordinary classification of notions, as *clear, distinct*, and adequate, is no part of the notion; it belongs to psychology. Notions, in fact, are here synonymous with mental representations; a clear notion is an abstract simple representation: a distinct notion is one where, in addition to the simplicity, there is one ‘mark’ or character emphasised as a sign for subjective cognition. There is no more striking mark of the formalism and decay of Logic than the favourite category of the ‘mark’. The adequate notion comes nearer the notion proper, or even the Idea: but after all it expresses only the formal circumstance that a notion or representation

agrees with its object, that is, with an external thing. The division into what are called subordinate and coordinate notions implies a mechanical distinction of universal from particular which allows only a mere correlation of them in external comparison. Again, an enumeration of such kinds as contrary and contradictory, affirmative and negative notions, etc., is only a chance-directed gleaning of logical forms which properly belong to the sphere of Being or Essence (where they have been already examined) and which have nothing to do with the specific notional character as such. The true distinctions in the notion, universal, particular, and individual, may be said also to constitute species of it, but only when they are kept severed from each other by external reflection. The immanent differentiating and specifying of the notion come to sight in the judgment: for to judge is to specify the notion.

(b) The Judgment

§ 166

The Judgment is the notion in its particularity, as a connection which is also a distinguishing of its functions, which are put as independent and yet as identical with themselves not with one another.

One's first impression about the Judgment is the independence of the two extremes, the subject and the predicate. The former we take to be a thing or term *per se*, and the predicate a general term outside the said subject and somewhere in our heads. The next point is for us to bring the latter into combination with the former, and in this way frame a Judgment. The copula 'is', however, enunciates the predicate *of* the subject, and so that external subjective subsumption is again put in abeyance, and the Judgment taken as a determination of the object itself. The etymological meaning of the Judgment (*Urtheil*) in German goes deeper, as it were declaring the unity of

the notion to be primary, and its distinction to be the original partition. And that is what the Judgment really is.

In its abstract terms a Judgment is expressible in the proposition: ‘The individual is the universal.’ These are the terms under which the subject and the predicate first confront each other, when the functions of the notion are taken in their immediate character or first abstraction. (Propositions such as, ‘The particular is the universal’, and ‘The individual is the particular’, belong to the further specialisation of the judgment.) It shows a strange want of observation in the logic-books, that in none of them is the fact stated, that in every judgment there is still a statement made, as, the individual is the universal, or still more definitely, The subject is the predicate (e.g. God is absolute spirit). No doubt there is also a distinction between terms like individual and universal, subject and predicate: but it is none the less the universal fact, that every judgment states them to be identical.

The copula ‘is’ springs from the nature of the notion, to be self-identical even in parting with its own. The individual and universal are its constituents, and therefore characters which cannot be isolated. The earlier categories (of reflection) in their correlations also refer to one another: but their interconnection is only ‘having’ and not ‘being’, i.e. it is not the identity which is realised as identity or universality. In the judgment, therefore, for the first time there is seen the genuine particularity of the notion: for it is the speciality or distinguishing of the latter, without thereby losing universality.

Judgments are generally looked upon as combinations of notions, and, be it added, of heterogeneous notions. This theory of judgment is correct, so far as it implies that it is the notion which forms the presupposition of the judgment, and which in the judgment comes up under the form of difference. But on the other hand, it is false to speak of notions differing in

kind. The notion, although concrete, is still as a notion essentially one, and the functions which it contains are not different kinds of it. It is equally false to speak of a combination of the two sides in the judgment, if we understand the term ‘combination’ to imply the independent existence of the combining members apart from the combination. The same external view of their nature is more forcibly apparent when judgments are described as produced by the ascription of a predicate to the subject.

Language like this looks upon the subject as self-subsistent outside, and the predicate as found somewhere in our head. Such a conception of the relation between subject and predicate however is at once contradicted by the copula ‘is’. By saying ‘This rose is red’, or ‘This picture is beautiful’, we declare, that it is not we who from outside attach beauty to the picture or redness to the rose, but that these are the characteristics proper to these objects. An additional fault in the way in which Formal Logic conceives the judgment is, that it makes the judgment look as if it were something merely contingent, and does not offer any proof for the advance from notion on to judgment. For the notion does not, as understanding supposes, stand still in its own immobility. It is rather an infinite form, of boundless activity, as it were the *punctum saliens* of all vitality, and thereby self-differentiating.

This disruption of the notion into the difference of its constituent functions — a disruption imposed by the native act of the notion — is the judgment. A judgment therefore means the particularising of the notion. No doubt the notion is implicitly the particular. But in the notion as notion the particular is not yet explicit, and still remains in transparent unity with the universal.

Thus, for example, as we remarked before (§ 160n), the germ of a plant contains its particular, such as root, branches, leaves, etc.: but these details are at first present only potentially, and are not realised till the germ uncloses. This unclosing is, as it were, the judgment of the plant. The

illustration may also serve to show how neither the notion nor the judgment are merely found in our head, or merely framed by us. The notion is the very heart of things, and makes them what they are. To form a notion of an object means therefore to become aware of its notion: and when we proceed to a criticism or judgment of the object, we are not performing a subjective act, and merely ascribing this or that predicate to the object. We are, on the contrary, observing the object in the specific character imposed by its notion.

§ 167

The Judgment is usually taken in a subjective sense as an operation and a form, occurring merely in self-conscious thought. This distinction, however, has no existence on purely by which the judgment is taken in the quite universal signification that all things are a judgment. That is to say, they are individuals which are a universality or inner nature in themselves — a universal which is individualised. Their universality and individuality are distinguished, but the one is at the same time identical with the other.

The interpretation of the judgment, according to which it is assumed to be merely subjective, as if we ascribed a predicate to a subject is contradicted by the decidedly objective expression of the judgment. The rose is red; Gold is a metal. It is not by us that something is first ascribed to them. A judgment is however distinguished from a proposition. The latter contains a statement about the subject, which does not stand to it in any universal relationship, but expresses some single action, or some state, or the like. Thus, ‘Caesar was born at Rome in such and such a year waged war in Gaul for ten years, crossed the Rubicon, etc.’, are propositions, but not judgments. Again it is absurd to say that such statements as ‘I slept well last night’ or ‘Present arms!’ maybe turned into the form of a judgment. ‘A carriage is passing by’ should be a judgment, and a subjective one at best,

only if it were doubtful, whether the passing object was a carriage, or whether it and not rather the point of observation was in motion: in short, only if it were desired to specify a conception which was still short of appropriate specification.

§ 168

The judgment is an expression of finitude. Things from its point of view are said to be finite, because they are a judgment, because their definite being and their universal nature (their body and their soul), though united indeed (otherwise the things would be nothing), are still elements in the constitution which are already different and also in any case separable.

§ 169

The abstract terms of the judgment, 'The individual is the Universal', present the subject (as negatively self-relating) as what is immediately concrete, while the predicate is what is abstract, indeterminate, in short, the universal. But the two elements are connected together by an 'is': and thus the predicate (in its universality) must also contain the speciality of the subject, must, in short, have particularity: and so is realised the identity between subject and predicate; which, being thus unaffected by this difference in form, is the content.

It is the predicate which first gives the subject, which till then was on its own account a bare mental representation or an empty name, its specific character and content. In judgments like 'God is the most real of all things', or 'The Absolute is the self-identical', God and the Absolute are mere names; what they are we only learn in the predicate. What the subject may be in other respects, as a concrete thing, is no concern of this judgment. (Cf. § 31.)

To define the subject as that of which something is said, and the predicate as what is said about it, is mere trifling. It gives no information about the distinction between the two. In point of thought, the subject is primarily the individual, and the predicate the universal. As the judgment receives further development, the subject ceases to be merely the immediate individual, and the predicate merely the abstract universal: the former acquires the additional significations of particular and universal, the latter the additional significations of particular and individual. Thus while the same names are given to the two terms of the judgment, their meaning passes through a series of changes.

§ 170

We now go closer into the speciality of subject and predicate. The subject as negative self-relation (§ § 163, 166) is the stable sub-stratum in which the predicate has its subsistence and where it is ideally present. The predicate, as the phrase is, inheres in the subject. Further, as the subject is in general and immediately concrete, the specific connotation of the predicate is only one of the numerous characters of the subject. Thus the subject is ampler and wider than the predicate.

Conversely, the predicate as universal is self-subsistent, and indifferent whether this subject is or not. The predicate outflanks the subject, subsuming it under itself: and hence on its side is wider than the subject. The specific content of the predicate (§ 19) alone constitutes the identity of the two.

The Judgment (continued) - The Syllogism

Transition to the Object

§ 193

This 'realisation' of the Notion — a realisation in which the universal is this one totality withdrawn back into itself (of which different members are no less the whole, and which has given itself a character of 'immediate' unity by merging the mediation) — this realisation of the notion is the Object.

This transition from the Subject, the notion in general, and especially the syllogism, to the Object, may, at the first glance, appear strange, particularly if we look only at the Syllogism of Understanding, and suppose syllogising to be only an act of consciousness, ... whether our usual conception of what is called an 'object' approximately corresponds to the object as here described. By 'object' is commonly understood not an abstract being, or an existing thing merely, or any sort of actuality, but something independent, concrete, and self-complete, this completeness being the totality of the notion. That the object is also an object to us and is external to something else, will be more precisely seen when it puts itself in contrast with the subjective. At present, as that into which the notion has passed from its mediation, it is only immediate object and nothing more, just as the notion is not describable as subjective, previous to the subsequent contrast with objectivity.

Further, the Object in general is the one total, in itself still unspecified, the Objective World as a whole, God, the Absolute Object. The object, however, has also difference attaching to it: it falls into pieces, indefinite in their multiplicity (making an objective world); and each of these individualised parts is also an object, an intrinsically concrete, complete, and independent existence.

Objectivity has been compared with being, existence, and actuality; and so too the transition to existence and actuality (not to being, for it is the primary and quite abstract immediate) may be compared with the transition

to objectivity. The ground from which existence proceeds, and the reflective correlation which is merged in actuality, are nothing but the as yet imperfectly realised notion. They are only abstract aspects of it — the ground being its merely essence-bred unity, and the correlation only the connection of real sides which are supposed to have only self-reflected being. The notion is the unity of the two; and the object is not a merely essence-like, but inherently universal unity, not only containing real distinctions, but containing them as totalities in itself.

It is evident that in all these transitions there is a further purpose than merely to show the indissoluble connection between the notion or thought and being. It has been more than once remarked that being is nothing more than simple self-relation, and this meagre category is certainly implied in the notion, or even in thought. But the meaning of these transitions is not to accept characteristics or categories, as only implied — a fault which mars even the Ontological argument for God's existence, when it is stated that being is one among realities. What such a transition does, is to take the notion, as it ought to be primarily characterised *per se* as a notion, with which this remote abstraction of being, or even of objectivity, has as yet nothing to do, and looking at its specific character as a notional character alone, to see when and whether it passes over into a form which is different from the character as it belongs to the notion and appears in it.

If the Object, the product of this transition, be brought into relation with the notion, which, so far as its special form is concerned, has vanished in it, we may give a correct expression to the result, by saying that notion (or, if it be preferred, subjectivity) and object are *implicitly* the same. But it is equally correct to say that they are different. In short, the two modes of expression are equally correct and incorrect. The true state of the case can be presented in no expressions of this kind. The 'implicit' is an abstraction, still more partial and inadequate than the notion itself, of which the

inadequacy is on the whole suspended, by suspending itself to the object with its opposite inadequacy. Hence that implicitness also must, by its negation, give itself the character of explicitness. As in every case, speculative identity is not the above-mentioned triviality of an *implicit* identity of subject and object. This has been said often enough. Yet it could not be too often repeated, if the intention were really to put an end to the stale and purely malicious misconception in regard to this identity — of which however there can be no reasonable expectation.

Looking at that unity in a quite general way, and raising no objection to the one-sided form of its implicitness, we find it as the well-known presupposition of the ontological proof for the existence of God. There it appears as supreme perfection. Anselm, in whom the notable suggestion of this proof first occurs, no doubt originally restricted himself to the question whether a certain content was in our thinking only. His words are briefly these: "Certainly that, than which nothing greater can be thought, cannot be in the intellect alone. For even if it is in the intellect alone, it can also be thought to exist in fact: and that is greater. If then that, than which nothing greater can be thought, is in the intellect alone; then the very thing, which is greater than anything which can be thought, can be exceeded in thought. But certainly this is impossible". The same unity received a more objective expression in Descartes, Spinoza, and others: while the theory of immediate certitude or faith presents it, on the contrary, in somewhat the same subjective aspect as Anselm. These Intuitionalists hold that *in our consciousness* the attribute of being is indissolubly associated with the conception of God. The theory of faith brings even the conception of external finite things under the same inseparable nexus between the consciousness and the being of them, on the ground that *perception* presents them conjoined with the attribute of existence: and in so saying, it is no doubt correct. It would be utterly absurd, however, to suppose that the

association in consciousness between existence and our conception of finite things is of the same description as the association between existence and the conception of God. To do so would be to forget that finite things are changeable and transient, i.e. that existence is associated with them for a season, but that the association is neither eternal nor inseparable. Speaking in the phraseology of the categories before us, we may say that, to call a thing finite, means that its objective existence is not in harmony with the thought of it, with its universal calling, its kind, and its end. Anselm, consequently, neglecting any such conjunction as occurs in finite things, has with good reason pronounced that only to be the Perfect which exists not merely in a subjective, but also in an objective mode. It does no good to put on airs against the Ontological proof, as it is called, and against Anselm thus defining the Perfect. The argument is one latent in every unsophisticated mind, and it recurs in every philosophy, even against its wish and without its knowledge — as may be seen in the theory of immediate belief.

The real fault in the argumentation of Anselm is one which is chargeable on Descartes and Spinoza, as well as on the theory of immediate knowledge. It is this. This unity which is enunciated as the supreme perfection or, it may be, subjectively, as the true knowledge, is presupposed, i.e. it is assumed only as potential. This identity, abstract as it thus appears, between the two categories may be at once met and opposed by their diversity; and this was the very answer given to Anselm long ago. In short, the conception and existence of the finite is set in antagonism to the infinite; for, as previously remarked, the finite possesses objectivity of such a kind as is at once incongruous with and different from the end or aim, its essence and notion. Or, the finite is such a conception and in such a way subjective, that it does not involve existence. This objection and this antithesis are got over, only by showing the finite to be untrue and these categories in their

separation to be inadequate and null. Their identity is thus seen to be one into which they spontaneously pass over, and in which they are reconciled.

Third Subdivision: The Notion B. The Object

Development of the Object
Mechanism - Chemism - Teleology

§ 194

The Object is immediate being, because insensible to difference, which in it has suspended itself. It is, further, a totality in itself, while at the same time (as this identity is only the implicit identity of its dynamic elements) it is equally indifferent to its immediate unity. It thus breaks up into distinct parts, each of which is itself the totality. Hence the object is the absolute contradiction between a complete independence of the multiplicity, and the equally complete non-independence of the different pieces.

The definition, which states that the Absolute is the Object, is most definitely implied in the Leibnitzian Monad. The Monads are each an object, but an object implicitly 'representative', indeed the total representation of the world. In the simple unity of the Monad, all difference is merely ideal, not independent or real. Nothing from without comes into the monad: it is the whole notion in itself, only distinguished by its own greater or less development. None the less, this simple totality parts into the absolute multeity of differences, each becoming an independent monad. In the monad of monads, and the Pre-established Harmony of their inward developments, these substances are in like manner again reduced to 'identity' and unsubstantiality. The philosophy of Leibnitz, therefore, represents contradiction in its complete development.

(1) As Fichte in modern times has especially and with justice insisted, the theory which regards the Absolute or God as the Object and there stops,

expresses the point of view taken by superstition and slavish fear. No doubt God is the Object, and, indeed, the Object out and out, confronted with which our particular or subjective opinions and desires have no truth and no validity. As absolute object, however, God does not therefore take up the position of a dark and hostile power over against subjectivity. He rather involves it as a vital element in himself. Such also is the meaning of the Christian doctrine, according to which God has willed that all men should be saved and all attain blessedness. The salvation and the blessedness of men are attained when they come to feel themselves at one with God, so that God, on the other hand, ceases to be for them mere object, and, in that way, an object of fear and terror, as was especially the case with the religious consciousness of the Romans. But God in the Christian religion is also known as Love, because in his Son, who is one with him, he has revealed himself to men as a man among men, and thereby redeemed them. All of which is only another way of saying that the antithesis of subjective and objective is implicitly overcome, and that it is our affair to participate in this redemption by laying aside our immediate subjectivity (putting off the old Adam), and learning to know God as our true and essential self.

Just as religion and religious worship consist in overcoming the antithesis of subjectivity and objectivity, so science too and philosophy have no other task than to overcome this antithesis by the medium of thought. The aim of knowledge is to divest the objective world that stands opposed to us of its strangeness, and, as the phrase is, to find ourselves at home in it: which means no more than to trace the objective world back to the notion - to our innermost self. We may learn from the present discussion the mistake of regarding the antithesis of subjectivity and objectivity as an abstract and permanent one. The two are wholly dialectical. The notion is at first only subjective: but without the assistance of any foreign material or stuff it proceeds, in obedience to its own action, to objectify itself. So, too,

the object is not rigid and processless. Its process is to show itself as what is at the same time subjective, and thus form the step onwards to the idea. Any one who, from want of familiarity with the categories of subjectivity and objectivity, seeks to retain them in their abstraction will find that the isolated categories slip through his fingers before he is aware, and that he says the exact contrary of what he wanted to say.

(2) Objectivity contains the three forms of Mechanism, Chemism, and Teleology. The object of mechanical type is the immediate and undifferentiated object. No doubt it contains difference, but the different pieces stand, as it were, without affinity to each other, and their connection is only extraneous. In chemism, on the contrary, the object exhibits an essential tendency to differentiation, in such a way that the objects are what they are only by their relation to each other: this tendency to difference constitutes their quality. The third type of objectivity, the teleological relation, is the unity of mechanism and chemism. Design, like the mechanical object, is a self-contained totality, enriched however by the principle of differentiation which came to the fore in chemism, and thus referring itself to the object that stands over against it. Finally, it is the realisation of design which forms the transition to the Idea.

(a) Mechanism

§ 195

The object (1) in its immediacy is the notion only potentially; the notion as subjective is primarily outside it; and all its specific character is imposed from without. As a unity of differents, therefore, it is a composite, an aggregate; and its capacity of acting on anything else continues to be an external relation. This is Formal Mechanism. Notwithstanding, and in this

connection and non-independence, the objects remain independent and offer resistance, external to each other.

Pressure and impact are examples of mechanical relations. Our knowledge is said to be mechanical or by rote, when the words have no meaning for us, but continue external to sense, conception, thought; and when, being similarly external to each other, they form a meaningless sequence. Conduct, piety, etc., are in the same way mechanical, when a man's behaviour is settled for him by ceremonial laws, by a spiritual adviser, etc.; in short, when his own mind and will are not in his actions, which in this way are extraneous to himself.

Mechanism, the first form of objectivity, is also the category which primarily offers itself to reflection, as it examines the objective world. It is also the category beyond which reflection seldom goes. It is, however, a shallow and superficial mode of observation, one that cannot carry us through in connection with Nature and still less in connection with the world of Mind. In Nature it is only the veriest abstract relations of matter in its inert masses which obey the law of mechanism. On the contrary the phenomena and operations of the province to which the term 'physical' in its narrower sense is applied, such as the phenomena of light, heat, magnetism, and electricity, cannot be explained by any mere mechanical processes, such as pressure, impact, displacement of parts, and the like.

Still less satisfactory is it to transfer these categories and apply them in the field of organic nature; at least if it be our aim to understand the specific features of that field, such as the growth and nourishment of plants, or, it may be, even animal sensation. It is at any rate a very deep-seated, and perhaps the main, defect of modern researches into nature, that, even where other and higher categories than those of mere mechanism are in operation, they still stick obstinately to the mechanical laws; although they thus conflict with the testimony of unbiased perception, and foreclose the gate to

an adequate knowledge of nature. But even in considering the formations in the world of Mind, the mechanical theory has been repeatedly invested with an authority which it has no right to. Take as an instance the remark that man consists of soul and body. In this language, the two things stand each self-subsistent, and associated only from without. Similarly we find the soul regarded as a mere group of forces and faculties, subsisting independently side by side.

Thus decidedly must we reject the mechanical mode of inquiry when it comes forward and arrogates to itself the place of rational cognition in general, and seeks to get mechanism accepted as an absolute category. But we must not on that account forget expressly to vindicate for mechanism the right and import of a general logical category. It would be, therefore, a mistake to restrict it to the special physical department from which it derives its name. There is no harm done, for example, in directing attention to mechanical actions, such as that of gravity, the lever, etc., even in departments, notably in physics and in physiology, beyond the range of mechanics proper. It must however be remembered that within these spheres the laws of mechanism cease to be final or decisive, and sink, as it were, to a subservient position. To which may be added that in Nature, when the higher or organic functions are in any way checked or disturbed in their normal efficiency, the otherwise subordinate category of mechanism is immediately seen to take the upper hand. Thus a sufferer from indigestion feels pressure on the stomach, after partaking of certain food in slight quantity; whereas those whose digestive organs are sound remain free from the sensation, although they have eaten as much. The same phenomenon occurs in the general feeling of heaviness in the limbs, experienced in bodily indisposition. Even in the world of Mind, mechanism has its place; though there, too, it is a subordinate one. We are right in speaking of mechanical memory, and all sorts of mechanical operations, such as

reading, writing, playing on musical instruments, etc. In memory, indeed, the mechanical quality of the action is essential: a circumstance of which the neglect has not unfrequently caused great harm in the training of the young, from the misapplied zeal of modern educationalists for the freedom of intelligence. It would betray bad psychology, however, to have recourse to mechanism for an explanation of the nature of memory, and to apply mechanical laws straight off to the soul. The mechanical feature in memory lies merely in the fact that certain signs, tones, etc., are apprehended in their purely external association, and then reproduced in this association, without attention being expressly directed to their meaning and inward association. To become acquainted with these conditions of mechanical memory requires no further study of mechanics, nor would that study tend at all to advance the special inquiry of psychology.

§ 196

The want of stability in itself which allows the object to suffer violence, is possessed by it (see preceding §) only in so far as it has a certain stability. Now as the object is implicitly invested with the character of notion, the one of these characteristics is not merged into its other; but the object, through the negation of itself (its lack of independence), closes with itself, and not till it so closes, is it independent. Thus at the same time in distinction from the outwardness, and negativing that outwardness in its independence, does this independence form a negative unity with self - Centrality (subjectivity). So conceived, the other itself has direction and reference towards the external. But this external object is similarly central in itself, and being so, is no less only referred towards the other centre; so that it no less has its centrality in the other. This is (2) Mechanism with Affinity (with bias, or 'difference'), and may be illustrated by gravitation, appetite, social instinct, etc.

§ 197

This relation, when fully carried out, forms a syllogism. In that syllogism the immanent negativity, as the central individuality of an object (abstract centre) relates itself to non-independent objects, as the other extreme, by a mean which unites the centrality with the non-independence of the objects (relative centre). This is (3) Absolute Mechanism.

§ 198

The syllogism thus indicated (I - P - U) is a triad of syllogisms. The wrong individuality of non-independent objects, in which formal Mechanism is at home, is, by reason of that non-independence, no less universality, though it be only external. Hence these objects also form the mean between the absolute-and the relative centre (the form of syllogism being U - I - P): for it is by this want of independence that those two are kept asunder and made extremes, as well as related to one another. Similarly absolute centrality, as the permanently underlying universal substance (illustrated by the gravity which continues identical), which as pure negativity equally includes individuality in it, is what mediates between the relative centre and the non-independent objects (the form of syllogism being P - U - I). It does so no less essentially as a disintegrating force, in its character of immanent individuality, than in virtue of universality, acting as an identical bond of union and tranquil self-containedness. Like the solar system, so for example in the practical sphere, the state is a system of three syllogisms.

(1) The Individual or person, through his particularity or physical or mental needs (which when carried out to their full development give civil society), is coupled with the universal, i.e. with society, law, right, government.

(2) The will or action of the individuals is the intermediating force which procures for these needs satisfaction in society, in law, etc., and which gives to society, law, etc., their fulfilment and actualisation.

(3) But the universal, that is to say the state, government, and law, is the permanent underlying mean in which the individuals and their satisfaction have and receive their fulfilled reality, intermediation, and persistence. Each of the functions of the notion, as it is brought by intermediation to coalesce with the other extreme, is brought into union with itself and produces itself: which production is self-preservation. It is only by the nature of this triple coupling, by this triad of syllogisms with the same terming that a whole is thoroughly understood in its organisation.

§ 199

The immediacy of existence, which the objects have in Absolute Mechanism, is implicitly negatived by the fact that their independence is derived from, and due to, their connections with each other, and therefore to their own want of stability. Thus the object must be explicitly stated as in its existence having an Affinity (or a bias) towards its other - as not-indifferent.

(b) Chemism

§ 200

The not-indifferent (biased) object has an immanent mode which constitutes its nature, and in which it has existence. But as it is invested with the character of total notion, it is the contradiction between this totality and the special mode of its existence. Consequently it is the constant endeavour to cancel this contradiction and to make its definite being equal to the notion.

Chemism is a category of objectivity which, as a rule, is not particularly emphasised, and is generally put under the head of mechanism. The

common name of mechanical relationship is applied to both, in contradistinction to the teleological. There is a reason for this in the common feature which belongs to mechanism and chemism. In them the notion exists, but only implicit and latent, and they are thus both marked off from teleology where the notion has real independent existence. This is true: and yet chemism and mechanism are very decidedly distinct. The object, in the form of mechanism, is primarily only an indifferent reference to self, while the chemical object is seen to be completely in reference to something else. No doubt even in mechanism, as it develops itself, there spring up references to something else: but the nexus of mechanical objects with one another is at first only an external nexus, so that the objects in connection with one another still retain the semblance of independence.

In nature, for example, the several celestial bodies, which form our solar system, compose a kinetic system, and thereby show that they are related to one another. Motion, however, as the unity of time and space, is a connection which is purely abstract and external. And it seems therefore as if these celestial bodies, which are thus externally connected with each other, would continue to be what they are, even apart from this reciprocal relation. The case is quite different with chemism. Objects chemically biased are what they are expressly by that bias alone. Hence they are the absolute impulse towards integration by and in one another.

§ 201

The product of the chemical process consequently is the Neutral object, latent in the two extremes, each on the alert. The notion or concrete universal, by means of the bias of the objects (the particularity), coalesces with the individuality (in the shape of the product), and in that only with itself. In this process too the other syllogisms are equally involved. The place of mean is taken both by individuality as activity, and by the concrete

universal, the essence of the strained extremes; which essence reaches definite being in the product.

§ 202

Chemism, as it is a reflectional nexus of objectivity, has pre-supposed, not merely the bias or non-indifferent nature of the objects, but also their immediate independence. The process of chemism consists in passing to and fro from one form to another; which forms continue to be as external as before. In the neutral product the specific properties, which the extremes bore towards each other, are merged. But although the product is conformable to the notion, the inspiring principle of active differentiation does not exist in it; for it has sunk back to immediacy. The neutral body is therefore capable of disintegration. But the discerning principle, which breaks up the neutral body into biased and strained extremes, and which gives to the indifferent object in general its affinity and animation towards another; that principle, and the process as a separation with tension, falls outside of that first process.

The chemical process does not rise above a conditioned and finite process. The notion as notion is only the heart and core of the process, and does not in this stage come to an existence of its own. In the neutral product the process is extinct, and the existing cause falls outside it.

§ 203

Each of these two processes, the reduction of the biased (not-indifferent) to the neutral, and the differentiation of the indifferent or neutral, goes its own way without hindrance from the other. But that want of inner connection shows that they are finite, by their passage into products in which they are merged and lost. Conversely the process exhibits the nonentity of the presupposed immediacy of the not-indifferent objects. By this negation of

immediacy and of externalism in which the notion as object was sunk, it is liberated and invested with independent being in face of that externalism and immediacy. In these circumstances it is the End (Final Cause).

The passage from chemism to the teleological relation is implied in the mutual cancelling of both of the forms of the chemical process. The result thus attained is the liberation of the notion, which in chemism and mechanism was present only in the germ, and not yet evolved. The notion in the shape of the aim or end thus comes into independent existence.

(c) Teleology

§ 204

In the End the notion has entered on free existence and has a being of its own, by means of the negation of immediate objectivity. It is characterised as subjective, seeing that this negation is, in the first place, abstract, and hence at first the relation between it and objectivity still one of contrast. This character of subjectivity, however, compared with the totality of the notion, is one-sided, and that, be it added, for the End itself, in which all specific characters have been put as subordinated and merged. For it therefore even the object, which it presupposes, has only hypothetical (ideal) reality - essentially no-reality. The End, in short, is a contradiction of its self-identity against the negation stated in it, i.e. its antithesis to objectivity, and being so, contains the eliminative or destructive activity which negates the antithesis and renders it identical with itself. This is the realisation of the End: in which, while it turns itself into the other of its subjectivity and objectifies itself, thus cancelling the distinction between the two, it has only closed with itself, and retained itself.

The notion of Design or End, while on one hand called redundant, is on another justly described as the rational notion, and contrasted with the

abstract universal of understanding. The latter only *subsumes* the particular, and so connects it with itself: but has it not in its own nature. The distinction between the End or *final cause*, and the mere *efficient cause* (which is the cause ordinarily so called), is of supreme importance. Causes, properly so called, belong to the sphere of necessity, blind, and not yet laid bare. The cause therefore appears as passing into its correlative, and losing its primordiality thereby sinking into dependency. It is only by implication, or for us, that the cause is in the effect made for the first time a cause, and that it there returns into itself. The End, on the other hand, is expressly stated as containing the specific character in its own self - the effect, namely, which in the purely causal relation is never free from otherness. The End therefore in its efficiency does not pass over, but retains itself, i.e. it carries into effect itself only, and is at the end what it was in the beginning or primordial state. Until it thus retains itself, it is not genuinely primordial. The End then requires to be speculatively apprehended as the notion, which itself in the proper unity and ideality of its characteristics contains the judgment or negation - the antithesis of subjective and objective - and which to an equal extent suspends that antithesis.

By End however we must not at once, nor must we ever merely, think of the form which it has in consciousness as a mode of mere mental representation. By means of the notion of Inner Design Kant has resuscitated the Idea in general and particularly the idea of life. Aristotle's definition of life virtually implies inner design, and is thus far in advance of the notion of design in modern Teleology, which had in view finite and outward design only.

Animal wants and appetites are some of the readiest instances of the End. They are the *felt* contradiction, which exists within the living subject, and pass into the activity of negating this negation which mere subjectivity still is. The satisfaction of the want or appetite restores the peace between

subject and object. The objective thing which, so long as the contradiction exists, i.e. so long as the want is felt, stands on the other side, loses this quasi-independence, by its union with the subject. Those who talk of the permanence and immutability of the finite, as well subjective as objective, may see the reverse illustrated in the operations of every appetite. Appetite is, so to speak, the conviction that the subjective is only a half-truth, no more adequate than the objective. But appetite in the second place carries out its conviction. It brings about the supersession of these finites: it cancels the antithesis between the objective which would be and stay an objective only, and the subjective which in like manner would be and stay a subjective only.

As regards the action of the End, attention may be called to the fact, that in the syllogism, which represents that action, and shows the end closing with itself by the means of realisation, the radical feature is the negation of the *termini*. That negation is the one just mentioned both of the immediate subjectivity appearing in the End as such, and of the immediate objectivity as seen in the means and the objects presupposed. This is the same negation as is in operation when the mind leaves the contingent things of the world as well as its own subjectivity and rises to God. It is the 'moment' or factor which (as noticed in the Introduction and § 192) was overlooked and neglected in the analytic form of syllogisms, under which the so-called proofs of the Being of a God presented this elevation.

§ 205

In its primary and immediate aspect the Teleological relation is *external* design, and the notion confronts a presupposed object. The End is consequently finite, and that partly in its content, partly in the circumstance that it has an external condition in the object, which has to be found existing, and which is taken as material for its realisation. Its self-

determining is to that extent in form only. The unmediatedness of the End has the further result that its particularity or content - which as form-characteristic is the subjectivity of the End - is reflected into self, and so different from the totality of the form, subjectivity in general, the notion. This variety constitutes the finitude of Design within its own nature. The content of the End, in this way, is quite as limited, contingent, and given, as the object is particular and found ready to hand.

Generally speaking, the final cause is taken to mean nothing more than external design. In accordance with this view of it, things are supposed not to carry their vocation in themselves, but merely to be means employed and spent in realising a purpose which lies outside of them. That may be said to be the point of view taken by Utility, which once played a great part even in the sciences, but of late has fallen into merited disrepute, now that people have begun to see that it failed to give a genuine insight into the nature of things. It is true that finite things as finite ought in justice to be viewed as non-ultimate, and as pointing beyond themselves. This negativity of finite things however is their own dialectic, and in order to ascertain it we must pay attention to their positive content.

Teleological observations on things often proceed from a well-meant wish to display the wisdom of God as it is especially revealed in nature. Now in thus trying to discover final causes for which the things serve as means, we must remember that we are stopping short at the finite, and are liable to fall into trifling reflections: as, for instance, if we not merely studied the vine in respect of its well-known use for man, but proceeded to consider the cork-tree in connection with the corks which are cut from its bark to put into the wine-bottles. Whole books used to be written in this spirit. It is easy to see that they promoted the genuine interest neither of religion nor of science. External design stands immediately in front of the

idea: but what thus stands on the threshold often for that reason is least adequate.

§ 206

The teleological relation is a syllogism in which the subjective end coalesces with the objectivity external to it, through a middle term which is the unity of both. This unity is on one hand the purposive action, on the other the *Means*, i.e. objectivity made directly subservient to purpose.

The development from End to Idea ensues by three stages, first, Subjective End; second, End in process of accomplishment; and third, End accomplished. First of all we have the Subjective End; and that, as the notion in independent being, is itself the totality of the elementary functions of the notion. The first of these functions is that of self-identical universality, as it were the neutral first water, in which everything is involved, but nothing as yet discriminated. The second of these elements is the particularising of this universal, by which it acquires a specific content. As this specific content again is realised by the agency of the universal, the latter returns by its means back to itself, and coalesces with itself. Hence too when we set some end before us, we say that we 'conclude' to do something: a phrase which implies that we were, so to speak, open and accessible to this or that determination. Similarly we also at a further step speak of a man 'resolving' to do something, meaning that the agent steps forward out of his self-regarding inwardness and enters into dealings with the environing objectivity. This supplies the step from the merely Subjective End to the purposive action which tends outwards.

§ 207

(1) The first syllogism of the final cause represents the Subjective End. The universal notion is brought to unite with individuality by means of

particularity, so that the individual as self-determination acts as judge. That is to say, it not only particularises or makes into a determinate content the still indeterminate universal, but also explicitly puts an antithesis of subjectivity and objectivity, and at the same time is in its own self a return to itself; for it stamps the subjectivity of the notion, presupposed as against objectivity, with the mark of defect, in comparison with the complete and rounded totality, and thereby at the same time turns outwards.

§ 208

(2) This action which is directed outwards is the individuality, which in the Subjective End is identical with the particularity under which, along with the content, is also comprised the external objectivity. It throws itself in the first place immediately upon the object, which it appropriates to itself as a Means. The notion is this immediate power; for the notion is the self-identical negativity, in which the being of the object is characterised as wholly and merely ideal. The whole Middle Term is this inward power of the notion, in the shape of an agency, with which the object as Means is immediately united and in obedience to which it stands.

In finite teleology the Middle Term is broken up into two elements external to each other, (a) the action and (b) the object which serves as Means. The relation of the final cause as power to this object, and the subjugation of the object to it, is immediate (it forms the first premise in the syllogism) to this extent, that in the teleological notion as the self-existent ideality the object is put as potentially null. This relation, as represented in the first premise, itself becomes the Middle Term, which at the same time involves the syllogism, that through this relation – in which the action of the End is contained and dominant – the End is coupled with objectivity.

The execution of the End is the mediated mode of realising the End; but the immediate realisation is not less needful. The End lays hold of the

object immediately, because it is the power over the object, because in the End particularity, and in particularity objectivity also, is involved. A living being has a body; the soul takes possession of it and without intermediary has objectified itself in it. The human soul has much to do, before it makes its corporeal nature into a means. Man must, as it were, take possession of his body, so that it may be the instrument of his soul.

§ 209

(3) Purposive action, with its Means, is still directed outwards, because the End is also not identical with the object, and must consequently first be mediated with it. The Means in its capacity of object stands, in this second premise, in direct relation to the other extreme of the syllogism, namely, the material or objectivity which is presupposed. This relation is the sphere of chemism and mechanism, which have now become the servants of the Final Cause, where lies their truth and free notion. Thus the Subjective End, which is the power ruling these processes, in which the objective things wear themselves out on one another, contrives to keep itself free from them, and to preserve itself in them. Doing so, it appears as the Cunning of reason.

Reason is as cunning as it is powerful. Cunning may be said to lie in the intermediative action which, while it permits the objects to follow their own bent and act upon one another till they waste away, and does not itself directly interfere in the process, is nevertheless only working out its own aims. With this explanation, Divine Providence may be said to stand to the world and its process in the capacity of absolute cunning. God lets men do as they please with their particular passions and interests; but the result is the accomplishment of - not their plans, but his, and these differ decidedly from the ends primarily sought by those whom he employs.

§ 210

The Realised End is thus the overt unity of subjective and objective. It is however essentially characteristic of this unity, that the subjective and objective are neutralised and cancelled only in the point of their one-sidedness, while the objective is subdued and made conformable to the End, as the free notion, and thereby to the power above it. The End maintains itself against and in the objective: for it is no mere one-sided subjective or particular, it is also the concrete universal, the implicit identity of both. This universal, as simply reflected in itself, is the content which remains unchanged through all the three *termini* of the syllogism and their movement.

§ 211

In Finite Design, however, even the executed End has the same radical rift or flaw as had the Means and the initial End. We have got therefore only a form extraneously impressed on a pre-existing material: and this form, by reason of the limited content of the End, is also a contingent characteristic. The End achieved consequently is only an object, which again becomes a Means or material for other Ends, and so on for ever.

§ 212

But what virtually happens in the realising of the End is that the one-sided subjectivity and the show of objective independence confronting it are both cancelled. In laying hold of the means, the notion constitutes itself the very implicit essence of the object. In the mechanical and chemical processes, the independence of the object has been already dissipated implicitly, and in the course of their movement under the dominion of the End, the show of that independence, the negative which confronts the Notion, is got rid of.

But in the fact that the End achieved is characterised only as a Means and a material, this object, viz. the teleological, is there and then put as implicitly null, and only ‘ideal’. This being so, the antithesis between form and content has also vanished. While the End by the removal and absorption of all form-characteristics coalesces with itself, the form as self-identical is thereby put as the content, so that the notion, which is the action of form, has only itself for content. Through this process, therefore, there is made explicitly manifest what was the notion of design: viz. the implicit unity of subjective and objective is now realised. And this is the Idea.

This finitude of the End consists in the circumstance, that, in the process of realising it, the material, which is employed as a means, is only externally subsumed under it and made conformable to it. But, as a matter of fact, the object is the notion implicitly: and thus when the notion, in the shape of End, is realised in the object, we have but the manifestation of the inner nature of the object itself. Objectivity is thus, as it were, only a covering under which the notion lies concealed. Within the range of the finite we can never see or experience that the End has been really secured. The consummation of the infinite End, therefore, consists merely in removing the illusion which makes it seem yet unaccomplished. The Good, the absolutely Good, is eternally accomplishing itself in the world: and the result is that it need not wait upon us, but is already by implication, as well as in full actuality, accomplished. This is the illusion under which we live. It alone supplies at the same time the actualising force on which the interest in the world reposes.

In the course of its process the Idea creates that illusion, by setting an antithesis to confront it; and its action consists in getting rid of the illusion which it has created. Only out of this error does the truth arise. In this fact lies the reconciliation with error and with finitude. Error or other-being,

when superseded, is still a necessary dynamic element of truth: for truth can only be where it makes itself its own result.

Third Subdivision: The Notion C. The Idea

Development of The Idea
Life — Cognition — Absolute Idea

§ 213

The Idea is truth in itself and for itself — the absolute unity of the notion and objectivity. Its 'ideal' content is nothing but the notion in its detailed terms: its 'real' content is only the exhibition which the notion gives itself in the form of external existence, while yet, by enclosing this shape in its ideality, it keeps it in its power, and so keeps itself in it. The definition, which declares the Absolute to be the Idea, is itself absolute. All former definitions come back to this. The Idea is the Truth: for Truth is the correspondence of objectivity with the notion — not of course the correspondence of external things with my conceptions, for these are only *correct* conceptions held by *me*, the individual person. In the idea we have nothing to do with the individual, nor with figurate conceptions, nor with external things. And yet, again, everything actual, in so far as it is true, is the Idea, and has its truth by and in virtue of the Idea alone. Every individual being is some one aspect of the Idea: for which, therefore, yet other actualities are needed, which in their turn appear to have a self-subsistence of their own. It is only in them altogether and in their relation that the notion is realised.

The individual by itself does not correspond to its notion. It is this limitation of its existence which constitutes the finitude and the ruin of the individual.

The Idea itself is not to be taken as an idea of something or other, any more than the notion is to be taken as merely a specific notion. The Absolute is the universal and one idea, which, by an act of 'judgment', particularises itself to the system of specific ideas; which after all are constrained by their nature to come back to the one idea where their truth lies. As issued out of this 'judgment' the Idea is *in the first place* only the one universal *substance*: but its developed and genuine actuality is to be as a *subject* and in that way as mind.

Because it has no *existence* for starting-point and *point d'appui*, the Idea is frequently treated as a mere logical form. Such a view must be abandoned to those theories which ascribe so-called reality and genuine actuality to the existent thing and all the other categories which have not yet penetrated as far as the Idea. It is no less false to imagine the Idea to be mere abstraction. It is abstract certainly, in so far as everything untrue is consumed in it: but in its own self it is essentially concrete, because it is the free notion giving character to itself, and that character, reality. It would be an abstract form, only if the notion, which is its principle, were taken as an abstract unity, and not as the negative return of it into self and as the subjectivity which it really is.

Truth is at first taken to mean that I *know* how something *is*. This is truth, however, only in reference to consciousness; it is formal truth, bare correctness. Truth in the deeper sense consists in the identity between objectivity and the notion. It is in this deeper sense of truth that we speak of a true state, or of a true work of art. These objects are true, if they are as they ought to be, i.e. if their reality corresponds to their notion. When thus viewed, to be untrue means much the same as to be bad. A bad man is an untrue man, a man who does not behave as his notion or his vocation requires. Nothing however can subsist, if it be *wholly* devoid of identity between the notion and reality. Even bad and untrue things have being, in so

far as their reality still, somehow, conforms to their notion. Whatever is thoroughly bad or contrary to the notion is for that very reason on the way to ruin. It is by the notion alone that the things in the world have their subsistence; or, as it is expressed in the language of religious conception, things are what they are, only in virtue of the divine and thereby Creative thought which dwells within them.

When we hear the Idea spoken of, we need not imagine something far away beyond this mortal sphere. The Idea is rather what is completely present: and it is found, however confused and degenerated, in every consciousness. We conceive the works to ourselves as a great totality which is created by God, and so created that in it God has manifested himself to us. We regard the world also as ruled by Divine Providence: implying that the scattered and divided parts of the world are continually brought back, and made conformable, to the unity from which they have issued. The purpose of philosophy has always been the intellectual ascertainment of the Ideal; and everything deserving the name of philosophy has constantly been based on the consciousness of an absolute unity where the understanding sees and accepts only separation. It is too late now to ask for proof that the Idea is the truth. The proof of that is contained in the whole deduction and development of thought up to this point. The Idea is the result of this course of dialectic. Not that it is to be supposed that the idea is mediate only, i.e. mediated through something else than itself. It is rather its own result, and being so, is no less immediate than mediate. The stages hitherto considered, viz. those of Being and Essence, as well as those of Notion and of Objectivity, are not, when so distinguished, something permanent, resting upon themselves. They have proved to be dialectical; and their only truth is that they are dynamic elements of the idea.

§ 214

The Idea may be described in many ways. It may be called reason; (and this is the proper philosophical signification of reason); subject-object; the unity of the ideal and the real, of the finite and the infinite, of soul and body; the possibility which has its actuality in its own self; that of which the nature can be thought only as existent, etc. All these descriptions apply, because the Idea contains all the relations of understanding, but contains them in their infinite self-return and self-identity. It is easy work for the understanding to show that everything said of the Idea is self-contradictory. But that can quite as well be retaliated, or rather in the Idea the retaliation is actually made. And this work, which is the work of reason, is certainly not so easy as that of the understanding. Understanding may demonstrate that the Idea is self-contradictory: because the subjective is subjective only and is always confronted by the objective; because being is different from notion and therefore cannot be picked out of it; because the finite is finite only, the exact antithesis of the infinite, and therefore not identical with it; and so on with every term of the description. The reverse of all this however is the doctrine of Logic. Logic shows that the subjective which is to be subjective only, the finite which would be finite only, the infinite which would be infinite only, and so on, have no truth, but contradict themselves, and pass over into their opposites. Hence this transition, and the unity in which the extremes are merged and become factors, each with a merely reflected existence, reveals itself as their truth. The understanding, which addresses itself to deal with the Idea, commits a double misunderstanding. It takes first the extremes of the Idea (be they expressed as they will, so long as they are in their unity), not as they are understood when stamped with this concrete unity, but as if they remained abstractions outside of it. It no less mistakes the relation between them, even when it has been expressly stated. Thus, for example, it overlooks even the nature of the

copula in the judgment, which affirms that ; the individual, or subject, is after all not individual, but universal. But, in the *second* place, the understanding believes its 'reflection' that the self-identical Idea contains its own negative, or contains contradiction — to be an external reflection which does not lie within the Idea itself. But the reflection is really no peculiar cleverness of the understanding. The idea itself is the dialectic which for ever divides and distinguishes the self-identical from the differentiated, the subjective from the objective, the finite from the infinite, soul from body. Only on these terms is it an eternal creation, eternal vitality, and eternal spirit. But while it thus passes or rather translates itself into the abstract understanding, it for ever remains reason. The Idea is the dialectic which again makes this mass of understanding and diversity understand its finite nature and the pseudo-independence in its productions, and which brings the diversity back to unity. Since this double movement is not separate or distinct in time, nor indeed in any other way — otherwise it would be only a repetition of the abstract understanding — the Idea is the eternal vision of itself in the other, notion which in its objectivity *has* carried out *itself*, object which is inward design, essential subjectivity.

The different modes of apprehending the Idea as unity of ideal and real, of finite and infinite, of identity and difference, etc, are more or less formal. They designate some stage of the *specific* notion. Only the notion itself, however, is free and the genuine universal: in the Idea, therefore, the specific character of the notion is only the notion itself — an objectivity, viz. into which it, being the universal, continues itself, and in which it has only its own character, the total character. The Idea is the infinite judgment, of which the terms are severally the independent totality; and in which, as each grows to the fullness of its own nature, it has thereby at the same time passed into the other. None of the other specific notions exhibits this totality

complete on both its sides as the notion itself and objectivity.

§ 215

The Idea is essentially a process, because its identity is the absolute and free identity of the notion, only in so far as it is absolute negativity and for that reason dialectical. It is the ground of movement, in which the notion, in the capacity of universality which is individuality, gives itself the character of objectivity and of the antithesis thereto; and this externality which has the notion for its substance, finds its way back to subjectivity through its immanent dialectic As the idea is (a) a process, it follows that such an expression for the Absolute as unity of thought and being, of finite and infinite, etc., is false; for unity expresses an abstract and merely quiescent identity. As the Idea is (b) subjectivity, it follows that the expression is equally false on another account. That unity of which it speaks expresses a merely virtual or underlying presence of the genuine unity. The infinite would thus seem to be merely *neutralised* by the finite, the subjective by the objective, thought by being. But in the negative unity of the Idea, the infinite overlaps and includes the finite, thought overlaps being, subjectivity overlaps objectivity. The unity of the Idea is thought, infinity, and subjectivity, and is in consequence to be essentially distinguished from the Idea as *substance*, just as this overlapping subjectivity, thought, or infinity is to be distinguished from the one-sided subjectivity, one-sided thought, one-sided infinity to which it descends in judging and defining.

The idea as a process runs through three stages in its development. The first form of the idea is Life: that is, the idea in the form of immediacy. The second form is that of mediation or differentiation; and this is the idea in the

form of Knowledge, which appears under the double aspect of the Theoretical and Practical idea. The process of knowledge eventuates in the restoration of the unity enriched by difference. This gives the third form of the idea, the Absolute Idea: which last stage of the logical idea evinces itself to be at the same time the true first, and to have a being due to itself alone.

(a) Life

§ 216

The *immediate* idea is Life. As soul, the notion is realised in a body of whose externality the soul is the immediate self-relating universality. But the soul is also its particularisation, so that the body expresses no other distinctions than follow from the characterisations of its notion. And finally it is the Individuality of the body as infinite negativity — the dialectic of that bodily objectivity, with its parts lying out of one another, conveying them away from the semblance of independent subsistence back into subjectivity, so that all the members are reciprocally momentary means as well as momentary ends. Thus as life is the initial particularisation, so it results in the negative self-asserting unity: in the dialectic of its corporeity it only coalesces with itself. In this way life is essentially something alive, and in point of its immediacy this individual living thing. It is characteristic of finitude in this sphere that, by reason of the immediacy of the idea, body and soul are separable. This constitutes the mortality of the living being. It is only, however, when the living being is dead, that these two sides of the idea are different *ingredients*.

The single members of the body are what they are only by and in relation to their unity. A hand e.g. when hewn off from the body is, as Aristotle has observed, a hand in name only, not in fact. From the point of view of

understanding, life is usually spoken of as a mystery, and in general as incomprehensible. By giving it such a name, however, the Understanding only confesses its own finitude and nullity. So far is life from being incomprehensible, that in it the very notion is presented to us, or rather the immediate idea existing as a notion. And having said this, we have indicated the defect of life. Its notion and reality do not thoroughly correspond to each other. The notion of life is the soul, and this notion has the body for its reality. The soul is, as it were, infused into its corporeity; and in that way it is at first sentient only, and not yet freely self-conscious. The process of life consists in getting the better of the immediacy with which it is still beset: and this process, which is itself threefold, results in the idea under the form of judgment, i.e. the idea as Cognition.

§ 217

A living being is a syllogism, of which the very elements are in themselves systems and syllogisms (§ § 198, 201, 207). They are however active syllogisms or processes; and in the subjective unity of the vital agent make only one process. Thus the living being is the process of its coalescence with itself, which runs on through three processes.

Organic Nature
Sensibility, Irritability, and Reproduction

§ 218

(1) The first is the process of the living being inside itself. In that process it makes a split on its own self, and reduces its corporeity to its object or its inorganic nature. This corporeity, as an aggregate of correlations, enters in its very nature into difference and opposition of its elements, which mutually become each other's prey, and assimilate one another, and are

retained by producing themselves. Yet this action of the several members (organs) is only the living subject's one act to which their productions revert; so that in these productions nothing is produced except the subject: in other words, the subject only reproduces itself.

The process of the vital subject within its own limits has in Nature the threefold form of Sensibility, Irritability, and Reproduction. As Sensibility, the living being is immediately simple self-relation-it is the soul omnipresent in its body, the outsideness of each member of which to others has for it no truth. As Irritability, the living being appears split up in itself; and as Reproduction, it is perpetually restoring itself from the inner distinction of its members and organs. A vital agent only exists as this continually self-renewing process within its own limits.

Objective Nature
The matter which it assimilates

§ 219

(2) But the judgment of the notion proceeds, as free, to discharge the objective or bodily nature as an independent totality from itself; and the negative relation of the living thing to itself makes, as immediate individuality, the presupposition of an inorganic nature confronting it. As this negative of the animate is no less a function in the notion of the animate itself, it exists consequently in the latter (which is at the same time a concrete universal) in the shape of a defect or want. The dialectic by which the object, being implicitly null, is merged is the action of the self-assured living thing, which in this process against an inorganic nature thus retains, develops, and objectifies itself.

The living being stands face to face with an inorganic nature, to which it comports itself as a master and which it assimilates to itself. The result of

the assimilation is not, as in the chemical process, a neutral product in which the independence of the two confronting sides is merged; but the living being shows itself as large enough to embrace its other which cannot withstand its power. The inorganic nature which is subdued by the vital agent suffers this fate, because it is *virtually* the same as what life is actually. Thus in the other the living being only coalesces with itself. But when the soul has fled from the body, the elementary powers of objectivity begin their play. These powers are, as it were, continually on the spring, ready to begin their process in the organic body; and life is the constant battle against them.

The living individual

§ 220

(3) The living individual, which in its first process comports itself as intrinsically subject and notion, through its second assimilates its external objectivity and thus puts the character of reality into itself. It is now therefore implicitly a Kind, with essential universality of nature. The particularising of this Kind is the relation of the living subject to another subject of its Kind: and the judgment is the tie of Kind over these individuals thus appointed for each other. This is the Affinity of the Sexes.

Birth, Death and Genus

§ 221

The process of Kind brings it to a being of its own. Life being no more than the idea immediate, the product of this process breaks up into two sides. On the one hand, the living individual, which was at first presupposed as

immediate, is now seen to be mediated and generated. On the other, however, the living individuality, which, on account of its first immediacy, stands in a negative attitude towards universality, sinks in the superior power of the latter.
